is that evolved from a hidden system of lamps; in other words, where no portion of the lamps themselves are brought in direct contact with the retina of the eye. It is, however, only right to point out that this form of lighting, like many other nice things in this world, is, generally speaking, the most expensive, because, as a rule, it means the placing of the lamp or lamps under some form of shade, whereby a large portion of the illuminating power is lost, and therefore, and in order to get the same effect or amount of light from hidden lamps as from ordinary unshaded or only partly shaded lamps, double or even treble the amount of energy has to be used. In public halls, concert rooms, churches, &c., the points of light can, if taken from the ceiling or roof, be raised sufficiently far above the heads of the audience that, unless they wantonly gaze at the lamps, no inconvenience to the eyes need necessarily be felt; but it is different in the case of ordinary rooms, be they drawing-rooms, boudoirs, or dining-rooms; and it is these classes of rooms which, in my opinion, require the most careful thought as to the disposition and arranging of the lamps. In dealing with this matter, I am dealing solely and wholly with the incandescent electric lamp, and I do not propose to touch upon the question of arc lighting this evening, because, though this light is pre-eminently suited for streets, railway stations, and other similar places, it is not, and never will be, suitable in any way for the internal lighting of buildings. Many of you here this evening must, at some time or other, have been struck with what is generally termed the "glare" of the electric light, and may possibly have thought that this was one of the inherent faults of the system. It is nothing of the sort, and the fault lies, not in the system, but in the brain of the stupid person who put it there. No sane man or woman, with any regard to their eyes, wilfully stares at the noonday sun; but it is just as idiotic to put up a clear electric lamp and gaze at it as it is to gaze at the sun. Electricity, like most other things, to be properly appreciated must be suitably adapted to the end in view, which, as before stated, is a diffusion of soft light, without the lamp from which the light emanates being brought in direct contact with the eye. I am fully aware that the cost of complying with this requirement is in many cases too heavy to allow of its being adopted, but there is no reason why every electric lamp should not in some form or other be shaded, even if the shading is simply the putting in of an "obscured" lamp in the place of a clear one. It is evident, or at any rate should be evident, that the lighting of each particular room or space should be separately considered, and that being so, it is impossible to lay down any

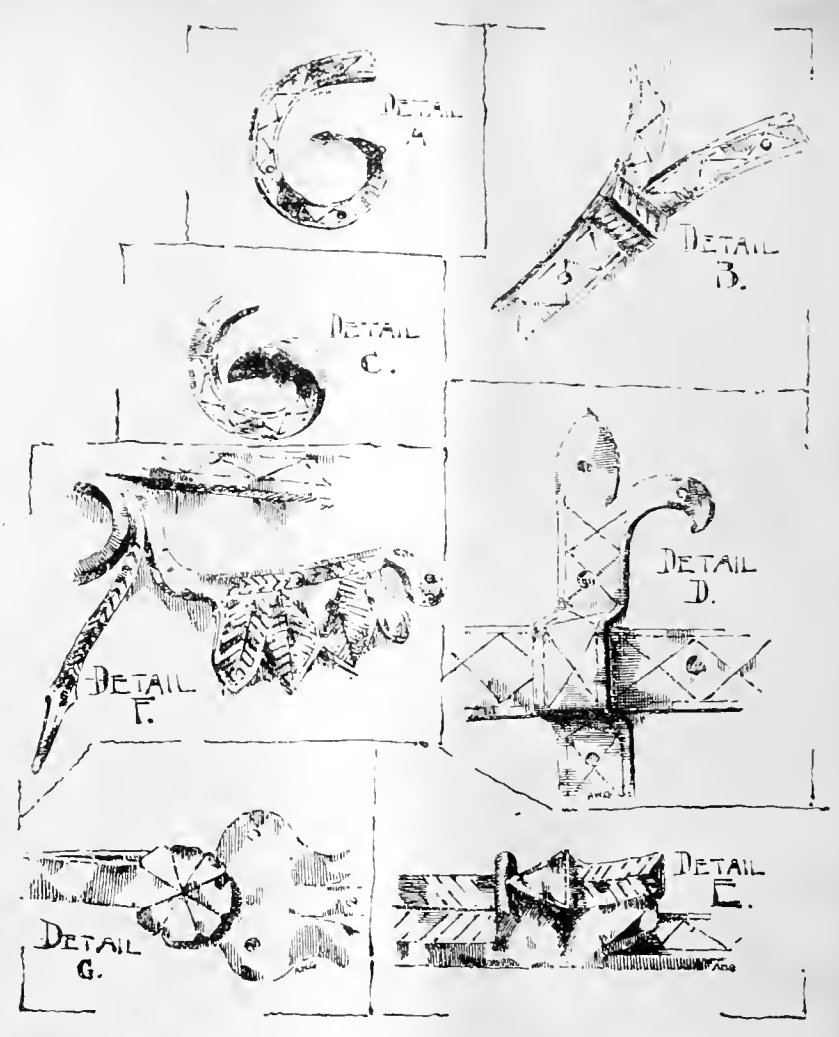
HARD-AND-FAST RULES

as to what is necessary in each particular case; and it requires a certain, or I may go even so far as to say a good deal of practical experience and judgment to know the proper amount of light required, and also the position in which the lamps should be placed. Under these circumstances, therefore, it is quite impossible for me to lay down any rules which would be of the slightest

value in enabling you to properly arrange for the lighting of any building in which you are interested. There are, as you are doubtless aware, certain "rule-of-thumb" rules, which are given in pocket-books and similar literature; but I have never found them to be of the slightest value, but, on the other hand, rather misleading. Take, for instance, a drawing-room. What use is it to anyone to know that a 16 candle-power lamp will light a certain number of square feet of floor when raised a given height above it? In my opinion, none, for the simple reason that it is quite impossible to take into calculation or make due allowance for the surrounding colouring of either walls or furniture. Leaving artistic effect out of the question for the moment, it is evident nothing is easier than to drop a number of pendants from the ceiling, and if these are kept a certain distance from the floor, you can procure the maximum amount of light with the minimum number of lamps and cost. This mode of lighting is, however, not to be recommended; indeed, it is strongly to be deprecated, and when one sees a room lighted in the above manner, it is at once apparent that a Goth, Vandal, or other barbarian, has had the arranging of the lights. I think it will be generally conceded that the most pleasant, and at the same time most artistic, method of lighting ordinary living-rooms is by means of wall-brackets, standard lamps, and table lamps, the lamp in each case being shaded so as not to come in direct contact with the eye. With regard to other rooms in a house, there is not, as a rule, much difficulty in assigning the right position for the lamps and their numbers; but at the risk of reiteration I would again impress upon you the desirability of considering the lighting of each room, or, at any rate, of each principal room, separately, and from the three points of view mentioned at the beginning of this paper.

WIRING.

Now, the next portion of my paper has to deal with the manner in which the electric current is brought from the place where it enters the building to the lamps themselves—in other words, that portion of the work generally spoken of under the comprehensive term of "wiring." As you are doubtless aware, this word "wiring" includes not only the supplying and laying of the various wires and cables, but also—at least, as a general rule—the switch and fuseboards and subsidiary switches, and occasionally the necessary "cutting away and making good," this latter expression being in many cases incorrect, as you, like myself, have probably found by experience that it could be more accurately described as "hacking and tearing away, and not making good." Many of you have doubtless had before you the tenders of some electric lighting contractors for the lighting or wiring of certain buildings, and perhaps have even gone so far as to draw up a common specification to which these various firms have tendered, and you have doubtless been surprised to find that the highest tender is sometimes half as much, and in some instances as much again as the lowest, and, furthermore, have been puzzled to know what should be done under the circumstances. Of course, if no specification has been issued, the reason of the difference in prices is easily explicable, inasmuch as the contractors having no common basis upon which to draw up their tenders, simply send in an estimate for the work and material they consider necessary, with the result that if the contractor is an honest man, taking proper pride in his work and with a reputation and good name to lose, his prices must be, and always are, considerably higher than those of an individual whose commercial instincts have unfortunately prevailed and got the better of his moral ones. It is far otherwise, however, if the contractors have tendered to a common specification, because if there are great discrepancies in the tender, it is evident either that the individual quoting the lowest figure is willing to forego all profit, or else that the one quoting the highest figure intends to make a fortune. Neither of these hypotheses are probable or ever likely to occur in practice, and it will generally be found that the real cause of the differences may be found in the loose and unscientific manner in which the specification has been drawn up. For a skilful, and perhaps unscrupulous, contractor nothing is easier than to drive a coach and four through a loosely and inaccurately drawn-up specification, whilst it is evident that even an honest contractor—being



but human—will avail himself of every opportunity in interpreting an ill-drawn clause to his own advantage. Perhaps I may be considered wanting in courtesy in suggesting that you are likely to draw up a faulty specification; but I can assure you nothing is further from my thoughts, and my only object in speaking thus plainly is to insist upon the absolute necessity of drawing up the specification in the most careful manner and with a full knowledge of the requirements necessary and incidental to the proper carrying out of the work. My experience has been that many points of vital importance to the work are—probably from want of technical knowledge—entirely omitted from many specifications, and others of no technical importance are treated with a fulness and amplification entirely unnecessary. What is the use of carefully specifying the density of current allowed per square inch of sectional area in the copper conductor, when the loss of pressure, or, to use a more technical phrase, the fall in voltage, or electro-motive force is omitted? None whatever, because in the case of a light, or group of lights, placed at some distance away from the source of supply, or point from whence the electric energy is brought into the house, the contractor might possibly be carrying out his work strictly in accordance with the specification, and yet the lamp or lamps would look like "hot hairpins," owing to the fact that the very essential point of loss of pressure had not been taken into account. Again, what is the use of specifying the most heavily insulated wire and omitting the final test when the work is completed? Instances like these could be given *ad libitum*, but for the purpose of argument this is unnecessary.

TWO WARNINGS.

There are still two points which I should like to warn you against, and these are, firstly, the low-priced contractor who looks to make his legitimate (or, as some would say, his illegitimate) profits on fittings; and, secondly, the contractor who offers to put in the work so that it will comply with the ridiculously low requirements—I refer to the test of the insulation resistances—of the fire offices. In London and other towns where there are electric supply companies, this latter danger is to a large extent rectified and guarded against by the fact that all work has to pass the more reasonable standard of the supply company; but it still remains in the cases of country houses and houses in towns where the owner or occupier generates his own electric energy.

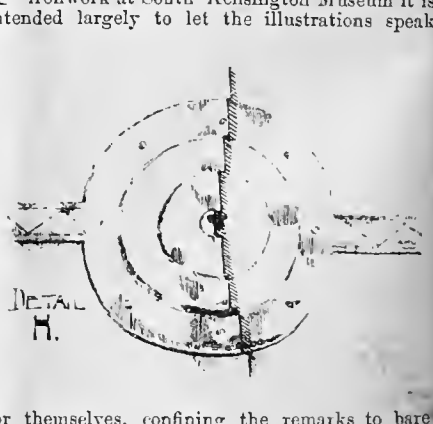
At the close of the reading of the two papers, a vote of thanks to Messrs. Eckstein and Ekin was unanimously adopted, on the motion of Mr. BANISTER FLETCHER, seconded by Mr. FRANCIS G. F HOOPER, and supported by Mr. MAX CLARKE.

IRONWORK AT SOUTH KENSINGTON MUSEUM.

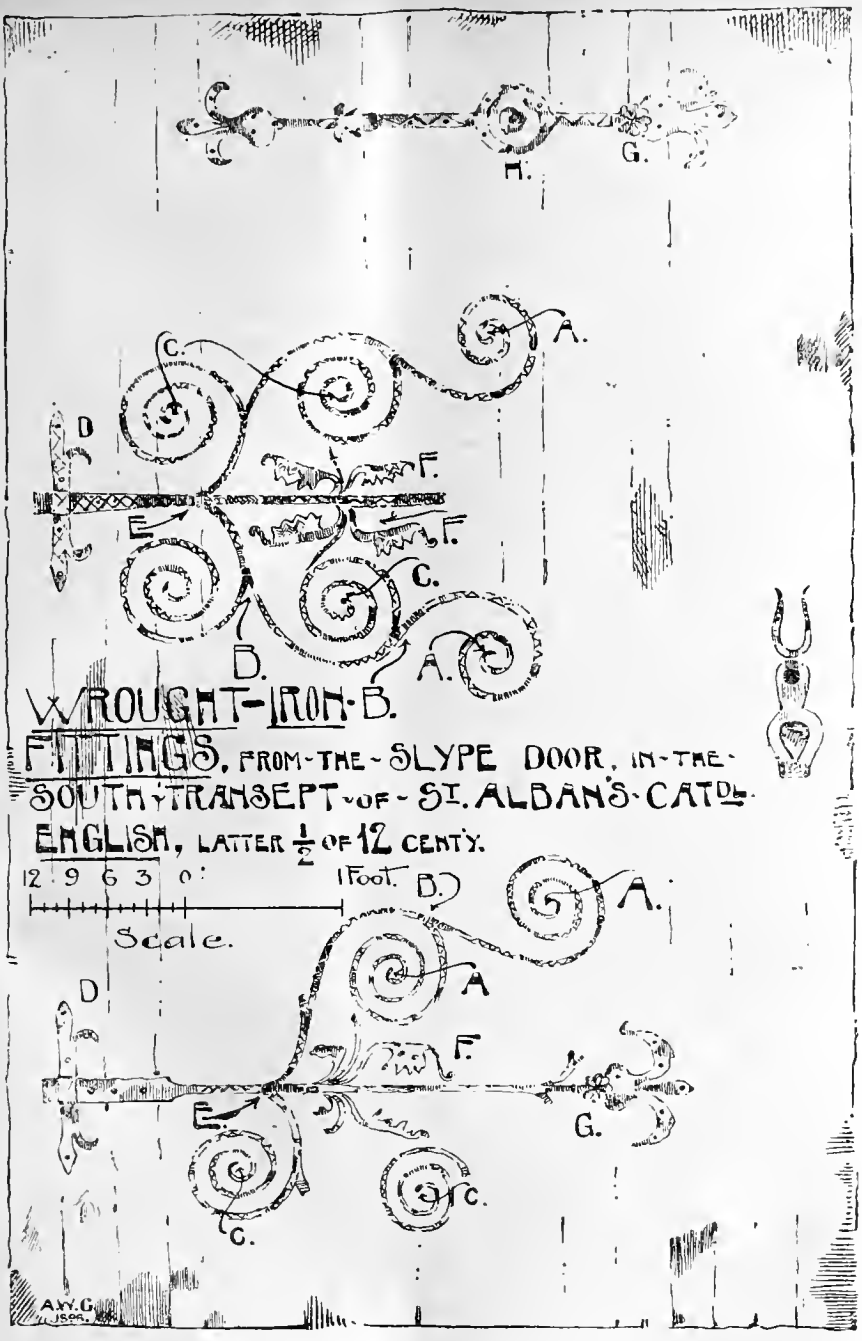
By G. A. T. MIDDLETON.

I.—ENGLISH: SLYPE DOOR FITTINGS FROM ST. ALBAN'S ABBEY.

IN this series of notes on the collection of ironwork at South Kensington Museum it is intended largely to let the illustrations speak



for themselves, confining the remarks to bare notices of the chief points which seem to be worth mentioning. The fittings from the slype door at St. Alban's, of which there is only a reproduction in the museum, are, for their early date, remarkably free in design and varied in



detail, the rich effect, however, being achieved by most simple means. One stamp only seems to have been employed, and that the edge of a blunt tool like a chisel, while all else is pure forging, cutting, and bending. The raised portions, as at B and E, and the twisting of terminals on edge, as at A and C, are marks of considerable courage and skill, as occurring on flat strap-hinges, and they well justify their employment. The rosette at G and the strap at D are more obvious and usual features: but the large rosette at H looks to be hammered out, and not built up of thin plates, as might be imagined.

THE RISE AND DEVELOPMENT OF THE PORTLAND CEMENT INDUSTRY.

AN address on the above subject, with special reference to the industry as carried on along the Medway, was given at the meeting of the Rochester Naturalists' Club on Wednesday in last week by Mr. W. R. Craske, the newly-elected president. He referred to the discovery by one John Aspdin, made over 70 years ago, that a combination of chalk and the blue clay found in the delta of the Medway, mixed in certain proportions and burnt to a clinker, and afterwards ground to fine powder, produced properties which, when mixed with water and incorporated with other materials of a suitable nature, produced a building material that had the advantages of great strength, durability, and cheapness, and which would harden quickly under water as well as in the air. The late Mr. J. Bazley White and Mr. J. C. Johnston may be credited with the development of the manufacture and an improvement in the quality that gained the confidence of users in the early fifties, and works were erected on the Medway and Thames. The late Mr. Burge, whose son is still connected with some of the Rochester works, in connection with Mr. Johnston, about that time took the old oil mill at Frindsbury, and converted it into the first cement works here. Their example was quickly followed by Messrs. Lee at Halling, Milton at Faversham and Upnor, Campbell at Wouldham, Hollick at Borstal, Larke at Strood, Weekes at Whorne's-place, and one or two others. Thirty years ago the total output did not exceed 1,000 or 1,200 tons on this river in a year. He went on to describe the wet process of manufacture of Portland cement carried on during the first 40 years, and the radical changes introduced during recent years. No detail in the works had called forth so much inventive ingenuity as the process of grinding. Those of Mr. J. Collis and Mr. P. J. Neate had proved among the most successful of the mills invented. To complete the sketch he dealt with the commercial side of the trade. The cheapness of labour in Continental countries is sometimes assigned as the reason why our principal competitors can undersell us in foreign markets; but it has yet to be proved that a true Portland cement can be made cheaper in Germany and Belgium than in England. The workmen's wage per hour is much lower there than here, but the work done is proportionately less, and the supervision is much greater. The average cost of manufacture has actually been shown to be rather lower in England. He estimated that the cement manufacturers in the neighbourhood of Rochester were now paying no less than £10,000 per week in wages, including the earnings of engineers employed upon machinery for cement works.

THE BOOK OF GLASGOW CATHEDRAL.*

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

MESSRS. MORRISON BROTHERS, of Glasgow, have just issued a monumental work, under the editorship of Mr. George Eyre-Todd; and Archbishop Eyre, with several other distinguished authorities, including Mr. John Honeyman, R.S.A., have contributed special chapters on the history and archæology of Glasgow Cathedral. The volume has been issued under the above title, enriched by 118 views and drawings, including sketches by Messrs. Herbert Railton, David Small, J. A. Duncan, and others, as well as some photographs.

It will be quite impossible, of course, in the space at our disposal to review in detail so comprehensive a work of nearly 500 pages, commencing with the "Beginnings of Glasgow," and following up with an account of the church through the dark ages, dealing with the ancient Chapter, and furnishing a list of the Archbishops and Bishops of the See after describing the fabric, and concluding with chapters on the Bishop's Castle, the episcopal seals, the prebends and manses of Glasgow, the stained-glass windows, as well as the monuments and inscriptions in the church buildings.

The foundation was established by St. Kentigern, whose birth is associated with legends fraught with conflicting evidences, the mother of the saint being an unmarried princess baptised by Servanus, who named her Tanen, of which St. Enoch, the dedicatory cognomen of one of the city churches in Glasgow, is but a corruption. Jocelyn tells us that Kentigern "established his cathedral seat in a town called Glesgu, which is interpreted *the dear family*, where he united to himself a famous and God-beloved family of servants of God, who practised abstinence, and who lived after the fashion of the primitive Church under the Apostles, without private property, in holy discipline and divine service." The editor of this admirable history furnishes an account of this ascetic churchman, whose missionary life among the pagans was marked by self-sacrifice and miracles wrought for the furtherance of his mission, which ended only with his death at an advanced old age. His tomb is shown in the lower church of the cathedral, and the necessarily obscure records of his life have been reckoned on, from all available evidences, to have been historical in the main. Those who would learn all that has been gathered by Mr. Eyre-Todd about this early prelate and his successor will find the story as here told to be exceedingly interesting and well sustained right away through the several periods down to the Reformation. For our immediate purpose to-day we must, however, leave these chapters about the bishops and the history of the chapter of the cathedral. The fabric itself, as it exists to-day, the more fittingly demands the attention of an architectural journal, and Mr. John Honeyman enables the reader to study the building with much advantage, aided by his entertaining and carefully written descriptions in the volume before us. Not a known vestige of the primitive church of Glasgow now remains, though circumstances seem to warrant the assumption that the cathedral really was erected over the tomb of the patron saint. Raised above the "haugh" in which the Molendinar flowed, the spot was sunny and retired, an excellent site for a group of Celtic cells with their usual circumvallation, but hardly suitable for a cathedral. It was not till the middle of the 12th century that any serious endeavour was made to rear the cathedral. The small piece of Transitional work in the S.W. corner of the lower church is mentioned as being possibly part of the church then erected by John Achaius, whose episcopate extended from 1115 to 1147. Some attribute this

* The Book of Glasgow Cathedral: a History and Description. Edited by GEO. EYRE-TODD. Profusely illustrated. Glasgow: Morison Bros., Renfield-street. Net price 42s.

work to Jocelin, and interesting comparisons have been made with similar details at Dryburgh, Kelso, and Jedburgh. These early remains at Glasgow give the clue to the plan of the church which occupied the ground when the choir was designed. The ruined choir at Jedburgh was probably an exact counterpart of the church at Glasgow, erected by Bishop Achaius, and Mr. Honeyman tells us that most likely the same architect who designed the Transitional choir at Glasgow also designed the magnificent nave at Jedburgh. It was he, probably, who planned the nave for Glasgow which was never built. A plan of the church, measured by Mr. Geo. S. Hill, is given with some detail drawings capitally shown, and most admirable are the geometrical sheets contributed by Mr. Wm. J. Anderson, illustrating the architecture of the choir.

Glasgow Cathedral, shorn of its old western adjuncts, is comparatively tame and diminutive in effect: but the interior is probably more grand and more impressive than any other of the same size. It is practically a two-storied building, and in this respect differs from any other church in Britain. Many others have crypts, but the crypt, so called, of Glasgow Cathedral is not one really, but a lower church—"ecclesia inferior," as it is invariably termed in documents referring to it. A feature of great interest in the plan is the east end, where the arrangement remains without any addition or alteration exactly as it was designed by the 13th-century architect. The choir is a complete design by one man. The east end of Durham has been quoted as exhibiting a similar arrangement, but this is a mistake. It resembles Glasgow in one respect only, and that is the placing of the several altars in juxtaposition along the east wall. In the first place, the chapel of the five altars is not an integral part of the choir. The chapel at Durham is strictly, as its name implies, a separate chamber spanned by one lofty vault. It bears no resemblance whatever to two parallel aisles. The Glasgow plan is simply an adaptation of the chapels of Norman choirs, such as those at Norwich and Gloucester, to a square end. There is no other example of the kind in any of our cathedrals. The plan as a whole is compact, and the exterior is symmetrical and harmonious. One of the best points of view is from the south-east, showing the full height of the building in its dignified impressiveness. The accompanying drawing by Mr. David Small realises the actuality with taste and skill. The lower drawing on our plate is from the facile pen of Mr. Herbert Railton. We shall at an early date give some other drawings of the building, and we will then return briefly to our notice of this interesting and valuable volume, about which we have now said sufficient to inspire our readers with a desire to become personally acquainted with the book itself, which would grace the library of any architect. It is handsomely bound in buckram, and beautifully printed.

THE SURVEYORS' INSTITUTION.

THE following student candidates have passed the examination for the Professional Associateship:—

Arthur George Andrews, 59, Parkgate-road, Chester; Harold Bridge Baverstock, 10, High-street, Abingdon, Berks; Ernest Charles Bedwell, Homedale, Carlton Colville, near Lowestoft; Charles Windsor Berry, Bracondale House, Worple-road, Wimbledon, S.W.; George Alfred Blyth, 24, Lonsdale-road, Barnes, S.W.; Thomas Ewen Butcher, The Rowans, Beaconsfield-road, St. Albans, Herts; Herbert Francis Carr, The Hollies, Waltham Abbey, Essex; Francis Lariot Chattell, 29A, Lincoln's Inn-fields, W.C.; Frank Sidney Chesterton, 31, Pembroke-road, Kensington, W.; Nathaniel Clark, jun., Beamish Park, Pitt Hill, R.S.O., Durham; John Constable, Ardle Lodge, Southfields, Wandsworth, S.W.; Fred. Harry Arthur Doncaster, Goodwin, Carysfort-road, Boscombe, Hants; Charles Roland Field, Trematon, Anerley-road, Anerley, S.E.; Noel Macintyre Foulkes, Grove Lodge, Tring, Herts; George Ernest Howgrave Graham, Heath Rise, 12, Willow-road, Hampstead, N.W.; Joseph Edward Gripper, Whatlington, Battle, Sussex; Reginald Charles Hassett, 14, Dering-street, New Bond-street, W.; John Frederick Hawkins, 6, Ravensbourne-road, Bromley, Kent; Harold Heal, Nower Hill, Pinner, N.W.; Henry Cubitt Heath, Kingsbridge House, Westcombe Park, Blackheath, S.E.; Henry Hinks, 23, Tavistock-road, Croydon; Martin George Humphry, Foxton House, Royston, Cambridgeshire; Robert Ewan Jackson, Hall Gowan, Carnforth, Lancashire; Reginald Johnstone, 22, Avenue-road, Swindon, Wilts; Robert Leake, Holmleigh, Palace Gates-road, Wood Green, N.; John Lewis, Worley-road, St. Alban's, Herts; Donald Lloyd, 16, Hilda-road, Brixton, S.W.; Frederick Robert Lumley, College of Agriculture, Downton, Wilts; William Mortimer Marcus, 20, Strathblane-road, New Wandsworth, S.W.; Frederick Rowland Mirk, 49, Forest-road, Forest Gate, E.; Edward Ernest Meacher, 12, Marriott-road, Barnet, Herts; Sydney George Meacher, Sunny Lodge, Malvern Link, Worcestershire; Sidney Samuel Orchard, 3, Jubilee-terrace, Leek, Stafford; Francis Arthur Pearce, 78, Blenheim-gardens, Willesden Green, N.W.; Thomas William Pearse, Stoliford, Modbury, South Devon; Charles Edward Pease, Lancaster Lodge, Lauriston-road, Wimbledon, S.W.; Charles Oliver Rawstron, 230, High-street, Rotherham; Charles Frederick Redfern, Elleray, Northfield, near Birmingham; †Richard George Gordon Reed, Glendevon, Addiscombe-road, Croydon; Walter Francis Robbins, Crockshard, Wingham, near Dover, Kent; Sydney Searle, Hamilton House, Florence-road, Ealing, W.; Harold Sheldon, Town Hall Chambers, Middlewich, Cheshire; Harold Orlando Stallard, Heath Vicarage, Leighton Buzzard, Beds; Walter William Tremlett, College of Agriculture, Downton, Wilts; John Graham Weall, Rutland Lodge, Watford, Herts; Cyril Swaffer Weekes, Royten House, Mount Sion, Tunbridge Wells, Kent; Hugh Welsh, Dovenby, Cockermouth, Cumberland; Herbert Guy Buckell Wyatt, 10, West Pallant, Chichester, Sussex; James Dawbarn Young, Woodlands, North-hill, Highgate, N. * Institution Prize, 1898. † Special Prize, 1898.

The following Non-Student Candidates have also passed the examination for the Professional Associateship:—

Arthur Allsebrook, Wollaton, Nottingham; Herbert George Andrews, 10, Tetcott-road, King's-road, Chelsea, S.W.; Francis Houghton Angel, 50, Russell-road, Kensington, W.; Edward Guy Attlee, Combmartin, 30, Upper Tooting High-road, S.W.; Arthur Edmund Bache, 15, Dornberg-road, Blackheath, S.E.; Geoffrey Clinton Baker, 19, St. Anne's-crescent, Lewes, Sussex; Stephen Allen Barns, 51, Brook-road, N.E.; Legh Barrett, Heathfield, Preston-road, Southport, Lancs; Claude Wm. Boileau Barton, Castlenau, Wimbledon Hill, S.W.; Frederick Roger Betenson, 26, Caversham-road, N.W.; John Charles Lebon Bettridge, 52, Hamilton-road, Wimbledon Hill, S.W.; Thomas Bibbey, Mostyn Estate Office, Llandudno, North Wales; Alfred Ernest Bradshaw, 12, Granville-terrace, Ramsgate, Kent; Arthur Allen Brown, Crown Hill, Croydon; Thomas Brown, 1, Lowther-street, Whitehaven, Cumberland; Charles Fitzpatrick Burroughes, East Witton, Middleham, R.S.O., Yorks; Albert King Burtenshaw, Market-square, Hailsham, Sussex; Reginald Robert Burton, 78, Alderney-street, S.W.; Charles Howard Campbell, Rhodes Farm, Eaton Hastings, Farringdon, Berks; Spencer Dyson Chadwick, 2, Pall Mall East, S.W.; Francis Joseph Cole, 26, Brigstocke-road, Ashley-road, Bristol; Cecil Goldar Fearn Culverhouse, 9, Whitehall-place, S.W.; Charles Tilley Darnell, Blaby, near Leicester; George Croshie Dawson, Daisyfield, Nuneaton, Warwickshire; Frederick Burfield Dyer, 2, St. Andrew's-place, Lewes, Sussex; Arnold Robertson Ellis, 2, St. Paul's-square, Bedford; Henry Helm Foster, 27, Avenue-parade, Accrington, Lancashire; Robert Strachan Gardiner, Wenallt, Crosswood, Aberystwith, S. Wales; Joseph Stubbins Goadby, 72, Onslow-gardens, Muswell Hill-road, Highgate, N.; Oswald Judd Healing, 53, Lady Margaret-road, Highgate-road, N.W.; Cecil Stuart Hodges, Woodholme, Sherwood-rise, Nottingham; Mackintosh Meleng Holl, Sywell, Northampton; Albert William Hudson, 315, Hoe-street, Walthamstow, Essex; John Arthur Jones, 54, Grafton-road, East Acton, W.; Percy Everley Jones, 100, Gordon-road, Ealing, W.; Charles Frederick Dashwood Lang, Vigo House, Weybridge, Surrey; John Seymour Milbourne, Fairford, Gloucestershire; Arthur Morris, 15, Denbigh-place, S.W.; Harry Thomas Mullett, 6, Earl-street, Cambridge; John Oscar Nesbit, 6, Limefield-terrace, Levenshulme, Manchester; Guy Murray Nicholson, 2 and 4, Old Queen-street, Westminster, S.W.; John Nutter, 10, Lonsdale-place, Whitehaven, Cumberland; Charles Stewart Orwin, South-Eastern Agricultural College, Wye, Kent; Dudley Francis Pearce, 80, Cheapside, E.C.; Alfred Tuke Priestman, Manningham Lodge, Bradford, Yorks; Henry Charles Robertson, Boland House, Petworth-street, Battersea Park, S.W.; Percy Willben Rogers, Craigenen, Carlton-road, Putney-hill, S.W.; Frank Russell Seller, Beaufort, Bromley, Kent; Frederic Smith, Loddington, Maidstone, Kent; George Henry Smith, Brookelands, New Malden, Surrey; Percy Wontner Smith, 34, Woodberry-grove, Finsbury-park, N.; John McClure Speakman, Sunnyside, Crewe, Cheshire; Frederick William Shultise Stanton, 23, The Paddock, Chatham, Kent; Frederick Stanley Sutton, Willow Cottage, 133, Brixton Hill, S.W.; Harold Swan, 114, Trinity-road, Upper Tooting, S.W.; *Charles John Howell Thomas, Mornington Villa, Hampstead-road, N.W.; William James Edgar Thomas, Oakridge, near Cardiff, Glamorganshire; William Edward Trent, 48, Buxton-road, Stratford, E.; Martin Hammond Ward, Carr Mill Cottage, St. Helen's, Lancashire; Herbert Andrew Cromartie Warmington, 11, Waterloo-place, S.W.; George Ford Weatherill, Edensor, Bakewell, Derbyshire; Reginald Spencer Wigram, 12A, Savile-row, W.; Peter Lloyd Armstrong Williams, 26A, Albert Bridge-road, Battersea, S.W.; John Wilson, Orgreave, Lichfield. (* Driver Prize and Penfold Silver Medal.

IRISH CANDIDATES.—Herbert Edward Kincaid, 4, Ailesbury-road, Dublin; Holt Waring, Waringstown, Co. Down; Henry Roger Brombead Wood-Martin, 6, Leinster-street, Dublin.

The following Professional Associates have passed the Fellowship Examination in Division IV.:—

Frederick Stuart Angus Banks, 101, Bethune-road, Stamford Hill, N.; Geoffry Lionel Barker, Llyndir, Rossett, North Wales; Philip Shelford Bidwell, Ely, Cambridgeshire; Charles Blackshaw, 125, Victoria-road, Kilburn, N.W.; Edwin Holmes Blake, 12, Chestnut-grove, Balham, S.W.; Edward Blount, 4, Frederick's-place, Old Jewry, E.C.; Montague Cecil Blunt, 8, Westbourne-crescent, Hyde Park, W.; George Lawrence Brighton, Claremont, 252, Barry-road, East Dulwich, S.E.; Sydney George Carnell, Rushton, Wellington, Shropshire; Harold Carpmael, 106, Croxted-road, West Dulwich, S.E.; Alfred Stott Cartwright, 20, Nantwich-road, Crewe; George Arthur Raddon Chamberlain, Leamington House, Malvern, Wells; William Clarkson, 136, High-street, Poplar, E.; Horace Collins, Frankford House, Randolph-road, W.; Keston Nelson Crowther, Hurstbourne, 80, Victoria-road, Clapham Common, S.W.; William Denton, Raisen Hall, Wadsley Bridge, Sheffield; †Charles Gerald Eve, 2, St. Paul's-square, Bedford; Hugh Cecil Farmer, 9, Whitehall-place, S.W.; John Harris Furmedge, Middleton Stoney, Bicester, Oxon; Henry Alexander Glover, 1, Motcomb-street, S.W.; John Nicholson Grierson, Turner's Hill, Cheshunt, Herts; William Erie Leigh Jenkinson, 6, Moorgate-street, E.C.; Ernest Joel Jones, 53, Maida Vale, W.; William Thomas Lamprill, 63, The Broadway, Stratford, E.; Edwin Bennett Brierley Newton, Borough Surveyor's Office, Rochdale; Charles Osenton, 222, Brighton-road, Croydon, Surrey; Shirley Hutchins Patch, The Chestnuts, Havelock-road, Addiscombe, Surrey; Octavius Burroughes Pearse, 35, Dugdale-street, Nuneaton; Philip Peebles, Estate Office, Alhury, near Guildford, Surrey; Capel Hereward Price, 89, St. Paul's-road, Camden-square, N.W.; James Richardson, Jun., 15, Barn Hill, Stamford, Lincolnshire; Theodore Richard Robinson, 25, Campden Hill Gardens, Kensington, W.; Joseph Taylor Rook, 23, Spencer-street, Carlisle, Cumberland; Cecil Herbert Russell, 20, Rockley-road, West Kensington Park, W.; Harry Shearburn, Munstead, Godalming, Surrey; Alfred Charles Skingle, 79, St. James-road, Brixton, S.W.; Samuel Skrimshire, 153, Saltram-crescent, St. Peter's Park, Paddington, W.; Joseph Townson Sly, 62, Osborn-road, Forest Gate, E.; Arthur Carnegie Standen, 40, Courtfield Gardens, South Kensington, S.W.; Lewis Herbert Strouts, Belgrave-place, St. Mary Cray, Kent; Bruce Swanwick, Leek Woolton, Warwick; †William Pease Theakston, 25, Ermine-street, Huntingdon; John Meadows Theobald Henley House, Spring-grove, Isleworth; William Townend, Seacroft, near Leeds, Yorkshire; Harold Bertram Vinten, 27, High-street, Ramsgate, Kent; Stephen Gladstane Wheatley, 263, Strand, W.C.; Lawrence Richard Wilson, 20, Albert-square, Manchester; Robert Stephenson Woof, Estate Office, Lowther, Penrith, Cumberland. (Penfold Gold Medal, 1898. † Bracketted equal, Crawter Prize, 1898.)

The following candidates have passed the direct Fellowship Examination in Division V.:—

Albert Player Isaac Cottercll, Lonsdale Chambers, Baldwin-street, Bristol; Joseph Harry Fry, 64, Craven Park, Willesden, N.W.; William Maltby Kerruish, 21, Athol-street, Douglas, Isle of Man; Joseph Archibald Maxwell, 21, Marlborough-road, Banbury, Oxon; Arthur Fletcher Reid, 5 and 6, Clement's Inn, Strand, W.C.; Joseph Samuel Rowland, Bridge Chambers, Burton-upon-Trent, Stafford; Samuel Parr Stewart, The Lawn, Arbury, Nuneaton, Warwick; Edwin Thomas Tutt, 3, Clarendon-road, Lewisham, S.E.

Twenty-five other candidates in the different Divisions are referred back to their studies in their typical subjects.

THE PASSMORE EDWARDS HOMES FOR EPILEPTICS, CHALFONT ST. PETER'S.

YESTERDAY a triple ceremony took place at the Colony for Epileptics which Mr. Passmore Edwards has given to the National Society for the Employment of Epileptics at Chalfont St. Peter, Bucks. The Duchess of Marlborough opened the Victoria House—a home for twenty-four men—which has just been completed from the designs of Mr. Maurice B. Adams, F.R.I.B.A., at the cost of Mr. Passmore Edwards. The builder is Mr. George Darlington, of Amersham. The foundation-stone was laid last summer by the Honourable T. F. Bayard, the late American Ambassador, as his last public act before returning to the United States. We illustrated the building on May 7th, 1897. The second ceremony yesterday was performed by the Duke of Marlborough, who laid the foundation-stone of the home which Mr. Passmore Edwards is building for housing twenty-four boys, and the third item in the day's proceedings was performed by Mrs. Passmore Edwards, who laid the memorial-stone of the Home for Girls, also in course of building, from the plans prepared by Mr. Maurice B. Adams, at the expense of Mr. Passmore Edwards. Illustrations of these buildings appeared in the BUILDING NEWS for June 25, 1897. Messrs. Miskin and Sons are the builders of both homes. Red brick and tiles are the materials employed, with rough cast upper stages, and stone sparingly used. An Isolation Home is being proceeded with close by, and near the Passmore Edwards Home a third house for twenty-four men has just been commenced, to be called the Greene Home. These are being carried out by Mr. George Darlington, the builder, and Mr. Adams is the architect. All of the buildings are varied in design, but in style and picturesqueness are made to harmonise.

THE COLLAPSE OF THE ROOF OF ABBEY MANSIONS, WESTMINSTER.

AT the Westminster Coroner's Court, on Monday, Mr. John Troutbeck, who was assisted by Mr. John Slater, B.A., F.R.I.B.A., as assessor, resumed his inquiry into the circumstances attending the death of the seven men killed by the collapse of the south portion of the building known as Abbey Mansions, Victoria and Orchard-streets, on April 21. The names of the victims are:—William Clifford Morse, 21, labourer; Joseph Henry Parker, 32, foreman;

Charles Weatherley, 47, labourer; Ernest George Lillywhite, 21, labourer; Hugh John Bray, 40, engine-driver; George Bridges Hillings, 28, bricklayer: and Henry Clements, 38, labourer. Mr. G. I. L. Blenkinsopp, inspector of factories, represented the Home Office, and Mr. H. Ashmead her Majesty's Office of Works. Mr. Thomas Blashill, superintending architect of the London County Council, and Mr. Seager Berry, of the Solicitor's department of the Council, watched the case on behalf of that body. Mr. A. C. Kent, soliciter, appeared for Mr. Rickard, the principal contractor; Mr. G. I. Edwards, solicitor, for Mr. S. Murrell, the contractor for the roof; Mr. G. C. Gardiner, solicitor, for relatives of Clements; Mr. Alexander Thompson, soliciter, for the relatives of Weatherley; and Mr. Roverson for the Institution of Surveyors. Mr. Alfred A. Hudson, barrister, held a watching brief for two merchants interested. Mr. Charles James Chirney Pawley, of Prince's Mansions, Victoria-street, said he was the architect of the buildings in Orchard-street. He was instructed by Mr. Rickard about two years ago to prepare plans and specifications, which he did. He submitted the plans to the district surveyor. The freeholders at that time were the governors of the Greycoat Hospital. After the plans were submitted to the district surveyor, the south block, which included the fallen part, was entirely re-planned. New plans were prepared about twelve months ago, and at that time some of the work had been done. The alteration affected the whole of the interior of the building. The new plans were submitted to the district surveyor. The work was carried on under witness's supervision. Mr. Rickard had a free hand in construction, subject to the provisions of the London Building Act. He visited the building at least four days a week. On November 17, 1897, representatives of Her Majesty's Office of Works came upon the scene, and a day or two later they entered into an agreement to take the building on lease. When the Government took it over he placed the building under the supervision of his assistant, Mr. Simpson. The Government had nothing whatever to do with the construction. Witness visited the building on Wednesday, April 20, the day before the accident. When on the roof of the south block he noticed several carpenters fixing skylights, and that there was considerable jarring going on. He further noticed that about three-fourths of the roof had been concreted for about a fortnight, and was quite dry; and that the remaining fourth—the part which collapsed—had been concreted quite recently. He gave Mr. Simpson strict instructions not to have any of the centres on the roof struck until he himself gave orders for it to be done. He had at that time in his mind a similar accident that had occurred in the same neighbourhood owing to the centres being struck too soon. A pier ran up through the building supporting the girders of the six floors and the roof. That pier weighed 28 tons, and the weight it would have to carry would be about 47 tons. The floors were carried by girders. The plans provided for an iron stanchion which was not put in. That stanchion would have carried 30 tons, and would have reduced the weight on the pier to 37 tons. On several occasions he gave instructions to Simpson, his representative, to have the stanchion put in. Mr. Rickard, the contractor, knew that it was to be put in. The Coroner: Is that the usual way of construction—to put in a stanchion after the building is up?—It is done, if it is safe to do it. In reply to further questions the witness said that no date was fixed in the Government contract for completion: but they were endeavouring to complete by midsummer. He visited the building about a quarter of an hour after the accident, and found it was practically gutted. He went on the roof of the north block, and asked Simpson whether he had carried out his instructions with regard to the striking of the centres. Simpson referred him to the roof contractor, who admitted that Simpson had instructed him not to remove the centring. Witness was satisfied that the removal of the centring was the initial cause of the accident. The concrete which fell from the roof weighed between 15 and 20 tons. The total weight involved in the collapse was between 150 and 200 tons. He examined the fallen concrete, and found it saturated with water. He was able to distinguish Banks's fireproof concrete, which was perfectly dry. The girders, which were of steel, were supplied to the order of Mr. Rickard by Messrs. Drew-Bear, Perks, and Co. He could not tell what bearing the girders had on the pier; but it should have been nine inches. Every girder was still in existence. The coroner pointed out that, according to the plans, the ground-floor girder should have measured 24ft. 6in., and that one which had been pointed out to the assessor by the foreman was only 22ft. 11in. in length. The difference would, he said, affect the bearings. The witness said that it was no part of his duty to see that the girders had proper bearings, but if he saw anything wrong he would immediately point it out. Mr. Simpson, his representative, was responsible for the girders being according to specification. A bearing of only 4in. would, he admitted, be improper. He noticed that many of the bricks had been crushed by the weight above. The pier measured 2ft. 6in. in thickness, and ran up to a height of 80ft. A pier of that description should be reduced as it went up. He believed there was a rule that a pier should not be carried up more than 12 times its own thickness, which in this case would have been 30ft. The Coroner: Then why did you provide for a pier 80ft. high, very nearly three times what you tell us is the recognised rule?—I was told that Banks's fireproof flooring would have a good deal to do with it. The Coroner: I asked why you carried it up 80ft. instead of 30ft. Because I thought it would do. I was bearing in mind the fireproof floor which is so well tied. The fact of carrying it up to 80ft. would reduce its carrying powers. The Coroner, referring to the omission of the iron stanchion, said he thought it was a curious way of building. The witness said he was of opinion that a mass of 150 tons falling would carry with it any building. The fact that steel joists were broken was very strong evidence of the very strong pressure that had been upon them. He was of opinion that the accident happened through the falling of the concrete roof on to the sixth floor. Mr. Kent stated at this juncture that the witness had been advised to obtain legal assistance, and counsel would be instructed for his re-examination. In those circumstances he asked the coroner to allow the re-examination to stand over. This course was assented to. Mr. George Simpson, architect and surveyor, assistant to the last witness, stated that in conjunction with Mr. Pawley he superintended the construction of the building. He saw the men putting in the centring for the concrete roof. It was supported by quartering secured with bolts, the whole resting on the lacing joists of the roof. He did not give directions as to the concrete to be used. The concreting of the roof was done in one continuous job, and he should say five or six days before the collapse. Murrell's men put it in. Witness received specific instructions from Mr. Pawley not to allow the centring to be removed. He immediately passed on the instruction to Murrell. After the collapse Murrell said he had instructed his foreman not to strike the centring. No clerk of the works was engaged. He did not consider that one was necessary, as he and Mr. Pawley were looking after the building. He knew that the centring had been struck, because it was lying on the adjoining roof. Mr. William R. Rickard, 124, City-road, builder and contractor, said that about two years ago he entered into an agreement with the freeholder for the erection of the mansions, and he instructed Mr. Pawley to prepare plans and specifications. It was his own venture. The south block was not commenced on the original plans, which were altered. He was first told of the stanchion about 12 months ago. It was not ordered because an engine and some machinery had been placed where it was to go. These were removed about a week before Easter. The sub-contract for the brickwork was placed with a Mr. Thorpe. Witness had no control over that. He had a sub-contractor for the flooring, and had no control over that. The same remark applied to the roof and the carpentering. Witness had control over the labourers' work. It was to his interest to see that the work was done as contracted for. The money which he had in the undertaking was advanced to him. On November 17 last he sold his interest in the concern for £1,000 profit to Mrs. Leeds, a lady residing at South Norwood, who was the freeholder. The Coroner: I understood that the freeholders were the governors of the Greycoat School? The witness replied that his freeholder was Mrs. Leeds. He was to finish the building at prime cost. There was no agreement as to the cost, but he took out the quantities and estimated the cost up to the roof at £20,000. He regarded Mrs. Leeds as the person responsible for any damage that might occur to life and property. It did not affect his pocket if the building stood or fell after November last. He believed the concrete was to consist of four parts of coke-breeze and one part of best Portland cement. It was to be turned over once in a dry state and twice while wet, but he did not know whether that was done. The way in which the concrete was mixed was very important. The inquiry was here adjourned.

At the adjourned inquest on Wednesday, Richard Martin Collins, a stonemason engaged on the south section of the building (the portion which collapsed) said he was employed by Mr. Courtney, the contractor for the stonework, and worked on the building from August last year until April 2. The brickwork was let to a Mr. Thorpe. Many of the bricks used in the internal walls were received from a job in St. James's-street, where they had been rejected. They were very soft and light. Some fell to pieces by mere handling, and were thrown into the mortar-mill. He could not swear that he saw any of the soft bricks used in the construction of the pier which supported the floor girders. The pier measured 3ft. 6in. by 1ft. 6in., not 3ft. 6in. by 2ft. 6in., as stated by the architect. Bricks and templates were consigned to Mrs. Leeds, the freeholder, and a Mr. Andrews used to sign for her. The templates supplied for the pier were not used for the pier at all. That would certainly affect the solidity of the building. When witness protested against small templates being used instead of large ones, he was jeered at and told to mind his own business. Mr. Thorpe's men fixed the girders. The principal carriage girder at the top went into a flue at both ends. He believed that a girder went right across the pier and that only two girders went through each floor. The lacing girders were never bolted up to the carriage girders when they were fixed. The lacing girders rested on the flanges of the carriage girders. Mr. Rickard, the contractor, never gave instructions. Mr. Pawley, the architect, occasionally gave directions. The building was up three or four floors before a girder was put in. The templates were put in and holes left for the girders by the bricklayers. Mr. W. J. W. Beckey, outside manager for the Banks' Fireproof Construction Syndicate, Ltd., said that that company put in the fireproof flooring. They were employed by Mr. Rickard, and never directly or indirectly by Mrs. Leeds. They employed their own men. He never put in the concrete floors until he saw that everything was right. He could not say whether all the lacing girders were bolted; but these girders were bolted on the second and third floors before the concrete was laid. By Mr. Kent: He saw the men mixing the concrete for the roof, and he thought that the way in which it was being mixed was not right. He told Andrews, the foreman, that in his opinion the way in which the men were working the stuff was scandalous. By Mr. Hudson: He could not say positively whether any of the girders were bolted or not, but he noticed nothing to prevent him from putting in the concrete. His duty was only to look to the lacing joists. The second, third, fourth, and fifth floors were concreted at the time of the accident, and witness was at work on the landings. The centring was in on the sixth floor. To Mr. Edwards: He should say the sample of concrete produced was of good quality. James Andrews, a carpenter, said he was employed by Mr. Rickard, and was general foreman of the job. He remembered alterations being made in the plans. It was decided, amongst other things, to make the brick pier a little thicker than provided for in the specification. He used his own discretion as to the way in which the templates were put in. Mr. Pawley told him to put in 4in. templates. Except for joinery he never used the specifications after the footings, although he was aware they were intended to convey instructions. He considered that as general foreman he had control over the many sub-contractors. The ironwork and concreting for the roof were contracted for by Mr. Murrell. He had told Murrell's foreman, Parker, that the concrete should be turned over at least once when dry. The Coroner pointed out that the specification said "at least twice," and said that all through the case witnesses tried to put the blame on other people. The witness, continuing, said that when the accident happened he found, much to his surprise, that the centring had been struck. The Coroner: The concrete roof had been up a fortnight; why should you be surprised?—Well, that was all I could

think of. I think concrete roofs are too heavy. In reply to further questions the witness said he heard that bricks came from another job, where they had been condemned. There were about 35,000 of them, and either Mr. Rickard or Mr. Simpson told him to do the best he could with them. Many of them were broken and soft; the whole ones were used for the internal walls, and the soft ones were put into the mortar-mill. He had never been on a job of this magnitude before without a clerk of the works being employed. The further hearing was adjourned.

At the adjourned inquiry yesterday (Thursday) Mr. W. Young, a solicitor, appeared to represent Mrs. Leeds, whose name has several times cropped up during the inquiry, and Mr. Trontbeck informed him that he wanted to get at the exact position held by that lady in relation to the building contract. James Andrews, who acted as foreman for Mr. Rickard, the principal contractor, continued his evidence. He gave a lengthy explanation of why certain alterations in the plans were made, and at the close the coroner remarked despairingly, "I daresay you know what you are talking about, but I'm sure I don't." His further evidence was postponed. Mr. Rickard produced the agreement entered into between him and Mrs. Harriet Susannah Leeds, of West Norwood, on Nov. 12 last year, under which she purchased his interest in the buildings for £1,000, and appointed him the contractor to carry on the work of erection. The case was proceeding when we went to press.

CHIPS.

The Leeds City Council have decided to extend the overhead electric system of traction to the Headingley, Chapeltown, Hunslet, and Dewsbury-road tramway routes.

The erection of an Elizabethan mansion, stables, and lodges has just been completed for Mr. W. H. Allen, J.P., in the county of Bedfordshire. It has been built of picked Weldon stone and red local tile roof, while the finishings inside are all of oak. The garden and grounds have been laid out by Messrs. J. Cheal and Sons, of Crawley. The whole of the works have been carried out under the direction of the architect, Mr. George P. Allen, of Adelphi Chambers, London.

Notwithstanding the assurance that the Great Western Railway Company were prepared to take over and work a railway fifty miles in length, which it was proposed should traverse Wales from east to west, a committee of the House of Commons, presided over by Sir Mark Stewart, have found themselves unable to authorise the raising of capital to the amount of £933,000.

On Sunday week the Bishop of Truro opened All Saints' Church, Bryher, Isles of Scilly, which has undergone a complete restoration. The church, situated close to the beach, succeeded, in 1821, a diminutive and unique structure erected about 1741. In 1860 the present edifice was renovated by the late Mr. Augustus Smith, and a tower and porch were added. The east end has now been entirely rebuilt, while the exterior of the building has been pointed.

A bust of the late Mr. Greig Smith was unveiled on Saturday evening at the Museum, Bristol. It has been executed by Mr. Ernest Fabian, modelling master at the Bristol School of Science and Art, Queen's-road.

A large landslip, involving the fall of many thousand tons of cliff, occurred opposite Cromer Lighthouse on Saturday afternoon. Fortunately, no one was injured. The earth covers the beach up to low-water mark. It is stated that some men who had been at work on the sea groyne lost some of their tools and clothing as a result of the slip. The site marked on the cliffs for Lloyd's signal station is now only some thirty yards from the edge of the cliff.

The Earl of Jersey, Colonel Boughey, and Mr. G. A. R. Fitzgerald, Light Railway Commissioners, sat at the Council Chamber, Salisbury, on Saturday, to hear an application from the London and South-Western Railway Company for powers to construct a light railway across Salisbury Plain, commencing at a point on the main line between Porton and Grateley, and proceeding by way of Amesbury to Shrewton. Mr. Andrews, engineer, stated that the line was 10¾ miles long, and would cost about £60,000 in construction. The War Office were entirely in favour of the proposal, and in addition the company had the support of the landowners and inhabitants of the district affected. In the end the Earl of Jersey said the Commissioners were prepared to recommend the Board of Trade to sanction the construction of the line subject to further negotiations on the points raised as to bridges and level-crossings.

OBITUARY.

Mr. Harrison Hayter, Past President of the Institution of Civil Engineers, who died on Thursday in last week, at his residence, 61, Addison-road, Kensington, at the age of 73 years, was one of the most prominent civil engineers in this country. In 1857 he joined the late Sir John Hawkshaw, who held in 1862-3 the Presidency of the Institution of Civil Engineers, as his principal assistant; in 1870 he was admitted as a partner with him, and continued his long and honourable professional career in connection with Sir John until the latter's retirement from business in 1888. At the date of his death Mr. Hayter was engaged, in company with his partner, Mr. J. C. Hawkshaw, in carrying out in Argentina a large system of docks at Buenos Ayres. Mr. Hayter had been a member of the Institution of Civil Engineers since May, 1862, and served as president in 1892-3.

Mr. Frank Willoughby Brind, architect, of 5, John-street, Bedford-row, W.C., died on Sunday last at his residence in Kensington, from acute pneumonia, at the early age of 32 years. Mr. Brind was the only surviving son of Mr. and Mrs. Frederick W. Brind, of Maze Hill, St. Leonards-on-Sea.

At Tue day's meeting of the Bristol City Council a letter was read from Sir W. H. Wills, Bart., M.P., offering to present to the city a picture by P. R. A. Müller, now on view at Messrs. Frost and Reed's gallery in Clifton, towards the establishment of a municipal art gallery. The offer was accepted with thanks.

The Unopposed Bill Committee of the House of Commons have passed the Bill authorising the Mersey Docks and Harbour Board to extend and improve their docks, basins, and works on the Liverpool side of the River Mersey. These works comprise the construction of five branch docks and three graving docks, and the enlargement and improvement of six existing docks. This Bill, which has already passed the House of Lords, will involve the expenditure of £3,562,000.

A large saw-mill, at Esplanade, Dundee, and tenanted by Mr. Thos. Winton, was destroyed by fire on Sunday. The mill contained much valuable machinery, and oak, ash, and elm wood. The damage is estimated at £3,000.

Mr. Henry Augustus Robinson, C.B., has been appointed Vice-President of the Local Government Board in Ireland, in the room of Sir George Morris, who has retired under the age rule. Mr. Robinson was formerly one of the Board's inspectors, and more recently one of the members of the Board. Mr. William Lawson Micks and Mr. Thomas Joseph Stefford have been appointed Commissioners on the Board.

The foundation-stone of a new church, dedicated to St. Hildeberg, was laid on Saturday in Stanley-road, Hoylake. Lord Stanley of Alderley presented the site, and also the sedilia and marbles. Plans were made by the architect, Mr. Edmund Kirby, F.R.I.B.A., for a complete church, and the committee began by building the nave as a first section on the tender of Mr. William Winnard, of Wigan. The cost of the building will be about £6,000, and it will provide accommodation for about 500.

The London County Council discussed at great length on Tuesday the recommendation of the General Purposes Committee to extend the radius within which, under the Council's contracts, London rates of pay and number of hours of work should be the rule from twelve to twenty miles, thus reverting to the arrangement in force before November last. Sir Arthur Arnold made a strong protest against the proposal, which was generally opposed by the Moderate Party, on the ground that the Council should be enabled, in the interests of the ratepayers, to take advantage of the lower rates of pay in country districts. The report was, however, adopted by 71 to 48 votes.

The new fever hospital, Westhulme, Oldham, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke-flues, and Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

At a meeting of the Bridgend and Cowbridge guardians on Saturday the workhouse alterations committee recommended that the sketch plans prepared by the architect (Mr. P. J. Thomas, Bridgend) be presented to the board to-morrow (Saturday.) It is proposed to acquire an additional acre of land adjoining the present building for about £1,000, and to erect thereon a new infirmary, with accommodation for from 80 to 100 beds, as well as to carry out extensive alterations in the present building. The total cost is estimated at from £15,000 to £20,000.

Building Intelligence.

Bolton.—Memorial-stones were laid on Friday of the Victoria Central Wealeyan Mission Hall, Bolton. The Victoria Hall proper, as distinct from its adjuncts, will accommodate 2,000 people, and will, in fact, be the largest building in Methodism. It occupies the site of the old Ridgeway Gates Chapel, and a new frontage has been made to Knowsley-street. The entrance to the whole of the buildings will be in Knowsley-street. One of the shops will be converted into an entrance hall, and a tower will be built over this to the height of 90ft. A spacious vestibule is provided, having an inquiry office, and to right and left broad staircases to the gallery of the hall. Beyond these, through a double archway, are the staircases to the lower floor. Past these staircases are the doorways to the main floor of the Victoria Hall, on the level of Knowsley-street. The centre part of the floor is sloped from front to back, and at the sides the seats are arranged tier above tier, so that everyone can have an uninterrupted view of the platform. The gallery has five tiers of seats at the sides, and twelve tiers at the back. The hall will be 117ft. long and 72ft. broad. As externally it will be very little seen, with the exception of the entrance tower, it will be severely plain. The internal roof will be arched and panelled with coved sides over part of the gallery. The windows will have arched heads, and will be filled in with painted glass. The platform recess will be arranged with broad pilasters and corbelled beams, the back being coved. The platform itself will be large enough for an orchestra and choir, and its front will be brought forward and rounded. The whole of the buildings will be lighted by electric light. Messrs. Bradshaw and Gass, of Bolton, are the architects, and the total cost, including additional land, will be between £20,000 and £30,000.

Bury, Lancs.—The United Methodist Free Church, Parkhills-road and Horne street, was formally opened yesterday (Thursday). The church consists of a simple nave, but is broken at the east end into chancel, and north and south transepts, which are partly in the church, and for the rest contain vestries with galleries over. The chancel and the vestries flanking it are three steps above the floor of the church. The east end is apsidal. The building is designed in a Late period of Gothic architecture. The nave windows are not pointed, but segment-headed broad openings, filled in with three compartments as regards the lower part, the upper being divided into a number of lancet openings. The other windows are pointed and traceried. All are filled in with lead lights. The tower is surmounted by a slender flèche covered with copper tiles. The dimensions of the chapel are 80ft. by 37ft. 6in. The chancel opening is 22ft. wide, and the depth of the chancel is 17ft. 6in. The height from floor to eaves is 17ft., from floor to highest point of ceiling 36ft., and floor to base of vane on tower 60ft. The accommodation provides for 487 sittings, inclusive of choir and west gallery. The materials used in the erection are, outside, brickwork, faced with plastic county bricks; inside, plastic bricks, by Mr. Samuel Knowles, of Holcombe Brook. Yorkshire stone is used for the sills, bands, &c., and the slates are of green Westmoreland. The interior woodwork is of figured pitch-pine throughout. The contract price was £2,500. The contractors are Messrs. Thompson and Brierley, and the architect is Mr. J. D. Mould, F.R.I.B.A., of Bury, Manchester, and London.

Leamington.—The foundation-stone of the new wing of the Warneford Hospital, Leamington, was laid on Friday, with full Masonic honours, by Lord Leigh. The wing is part of the original design for the extension of the hospital, and was last year adopted by Leamington as the local scheme for the commemoration of the Queen's Diamond Jubilee. The new structure, for which Messrs. Young and Hall, London, are the architects, will be built on the pavilion principle. The cost of the contract is £6,769. The wing will accommodate thirty-two additional patients, but the number of beds in the hospital will not be increased to this extent, as room will be found in the new wards for some of the patients who are at present treated in the old buildings, where the hygienic conditions are not wholly satisfactory. When the new wards are completed the entire capacity of the hospital will be increased to 125 beds.

PROPOSED R.C. CHURCH OF ST. AUGUSTINE, NOTTINGHAM.—GLASGOW CATHEDRAL.—THE COURT HOUSE, BROADWAY, WORCESTERSHIRE.—A COUNTRY HOUSE AT SUTTON.—DESIGN PLACED THIRD FOR ROYAL MASONIC SCHOOL FOR BOYS AT BUSHEY.—CENTRAL FIRE STATION, BOOTLE.

Our Illustrations.

R.C. CHURCH OF ST. AUGUSTINE, NOTTINGHAM.

This church is shortly to be erected on a somewhat limited site in the Woodbro'-road, Nottingham. The building will be built of local bricks and red Corsehill stone. The interior will be faced in stone. The plan explains the general arrangement, but it may be noted that the rapid fall of the street lends itself to the provision of the necessary vestries under the chancel. Mr. Arthur Marshall, A.R.I.B.A., of Nottingham, is the architect. The drawing is on view at the Royal Academy Exhibition.

GLASGOW CATHEDRAL.

(For description, see page 667).

THE COURT HOUSE, BROADWAY.

This house, situated in the Cotswolds, some half-mile out of Broadway, is now being built, and incorporated with the new house is the old gate-house or porter's lodge, which once belonged to the seat of the Sheldon family, who had a beautiful house here in the 17th century. This mansion has now all disappeared, having been used as a quarry for building purposes some long time since. The gatehouse, with its wide archways, dates from about the first quarter of the 17th century, and is interesting as combining in the plan and general detail the earlier traditional work, yet in the semicircular arches of the entrance, the Classical feeling of the impost mouldings, pilasters, and cornices, the effect of the Renaissance is seen. The new house does not aim in any way at being original, as it was felt that the old work should give the keynote of the composition, and effect has been gained by quiet grouping and detail in character with the simple work of the district. The architects are Messrs. E. Guy Dawber and Whitwell, and the contractors Messrs. Cowlin and Son, of Bristol. The drawing is at present in the Royal Academy Exhibition.

COUNTRY HOUSE, SUTTON.

The chief feature of this building calling for remark is the large central hall running up two floors with a gallery at one end. The hall also serves the purpose of a billiard-room, and this arrangement is an economical method of obtaining a good hall, which otherwise could not be had without a considerable increase in the cost. Another pleasant feature in the planning is the garden entrance below the staircase, through which can be obtained a pretty glimpse of the garden from the hall. The materials are red brick and stone facings to the large hall window. Portions of the upper parts and walls are finished with rough timbering and plaster, the timber being treated with Stockholm tar. The roof is to be finished with brindled tiles. The architect is Mr. Ernest Runtz. The illustration is from a drawing now at the Royal Academy.

ROYAL MASONIC SCHOOL FOR BOYS, BUSHEY, HERTS.

Illustrations of the selected design for this great Masonic Institution about to be erected at Bushey were published in our pages for 11th March last. The original drawing of the perspective view is now at the Royal Academy Exhibition. To-day we give a bird's-eye view and copy of the plan which was, we understand, placed third in order of merit in the referee's award. The joint authors of this design were Mr. J. Morley, architect, Cambridge, and Mr. W. J. Tapper, of Gray's Inn, W.C., Mr. H. S. East, of the latter address, being associated with them.

CENTRAL FIRE STATION, BOOTLE.

The accompanying view is reproduced from the original drawing by Messrs. Briggs and Wolstenholme, of Liverpool and Blackburn, whose design was placed second by the assessor in the recent competition; 22 architects submitted plans. It was proposed to face the buildings with red brick and buff terracotta dressings. The limit of cost laid down by the town council in their instructions to architects was £15,000.

CHIPS.

At Monday's meeting of the Wolverhampton Town Council, it was decided, as the recommendation of the Public Works Committee, that the work of demolishing the Exchange Hall to the level of St. Peter's churchyard be proceeded with at a cost of £1,855. The porch in Exchange-street will be removed, the lower portion of the building be utilised as a refrigeratory, and the roof of the vaults will be laid out as an open space, paved with rock asphalte, fenced with stone balusters, and ornamented with trees in tubs.

A gravitation water supply, which has been provided under county council auspices, for the combined special water districts of Kilmaurs and High Fenwick, was formally inaugurated on Saturday. The supply is wholly obtained from springs on the lands of South Drumboy, situated about four miles beyond the village of Fenwick. The whole works were carried out to the design and under the superintendence of Mr. P. Campbell Hart, A.M.I.C.E., of Kilmarnock and Glasgow, at an outlay of £4,200.

On Monday the ceremony was performed of unveiling a tablet in the south aisle of the nave of St. Thomas Church, Exeter, to the memory of the late Mr. Henry Stokes, who occupied the position of organist for several years. The tablet, which is placed near the organ, has been executed by Messrs. J. Easton and Sons, of Northernhay-street, Exeter, and is of pure statuary marble with black marble back.

A school for deaf mutes, erected by the Bristol School Board, in Kingston-parade, in that city, was opened on Tuesday. It has been built from plans by Mr. L. Bernard, F.R.I.B.A., and has cost for site and building about £150 per head for the 31 children to be taught within it.

Messrs. Christie, Manson, and Woods sold on Tuesday the small but choice collection of works of art of the 16th century, of the late Mr. T. M. Whitehead, of Cedars-road, Clapham-common. One hundred and forty-eight lots realised the total of £7,216 18s. 6d.

The Chesterfield Board of Guardians have decided, the old workhouse having been condemned by the Local Government Board officials, to build a new workhouse on a site in Ashgate-road.

The Monmouthshire County Council have decided to sanction the expenditure of about £5,000 for carrying out some temporary building works at the asylum, Abergavenny.

The sale of the Heckscher collection of works of art was concluded at Messrs. Christie, Manson, and Woods's on Friday, the interest and keen competition being kept up to the last lot. The total realised by the 324 lots amounted to £64,705 10s., which works out at an average of £200 per lot—one of the very highest averages ever realised by any collection of a like character. The first day's sale averaged nearly £280 per lot. Mr. Heckscher, who died in Paris twelvemonths ago at the age of 58, was born and partly educated in London. He was connected with the insurance business.

The Corporation of Derby received on Friday two gifts as custodians for the town. One is a portrait of Sir Thomas Roe, father of the corporation, twice mayor, and for many years one of its Parliamentary representatives. The other gift consisted of twelve water-colour drawings and five oil pictures by well-known artists, from Colonel T. H. Sale, R.E., of London.

COMPETITIONS.

Glasgow International Exhibition.—The draft conditions of the competition for designs for the exhibition buildings at Glasgow state that the space to be covered is thirteen acres or thereby, and the total cost of the buildings, inclusive of the dining and refreshment rooms, but exclusive of the grand hall, is not to exceed £60,000. The grand hall, which is to seat about 4,000 persons, is to be apart from the main building, and may be estimated for separately.

Godalming Municipal Buildings.—The municipal buildings committee recommended to the town council at its last meeting that the sum of £25 be paid to Mr. S. Welman for his trouble in surveying and reporting upon the various sites suitable for municipal buildings. They further recommended that the following firms or architects be invited to compete for the proposed buildings—viz., Ardrow and Dawson, Westminster; Charles Bell, London, E.C.; Colson, Farrow, and Nisbet, Winchester and London; John Jackson, London, E.C.; Lanchester Stewart and Rickards, London, W.C.; Henry Moon, Godalming; E. R. Robson, Westminster; J. W. Stevens, London, E.C.; A. H. Tiltman, London, W.C.; A. H. Verstage, Godalming; Samuel Welman, Godalming; and Woodhouse and Willoughby, Manchester; and that Mr. E. W. Mountford, F.R.I.B.A., be appointed assessor at a fee not exceeding twenty-five guineas. The recommendations were adopted.

Ludlow.—The town council recently received ten competitive schemes for lighting the borough by electricity, and have awarded the premium of £20 to Mr. Enwright, of Kensington. A committee reported to the council that they were disappointed to find that the mill-power was not sufficient to drive an electric-light plant. Of the ten schemes received only two exclusively dealt with the water-power, and these in such a way as to interfere with the waterworks power. They could not entertain a scheme which would interfere with the water-supply. Mr. Enwright's scheme proposed to use gas for driving power. The idea was to erect a Dowson's patent gas apparatus to provide its own gas, and to lay down two engines of 54H.P., which would be sufficient to provide light for six or seven hours a day for the whole borough. It was proposed to erect the plant in the Cattle Market, with a main feeder to the Butter Cross, from whence the mains would be distributed. The total expenditure for this scheme was £5,000, the estimated annual cost to the corporation was £650, and the estimated annual revenue £1,300, yielding a profit of £500 or £600 a year. Mr. Enwright also stated he would find a contractor to carry out the work at the figures named. The report was adopted.

Taunton Town Hall.—It was reported at the last meeting of the market trustees that thirteen architects had sent in plans in connection with the competition for providing designs for a new town hall. They are to be adjudicated upon by Mr. E. W. Mountford, F.R.I.B.A., of London, and will be exhibited in the Parade Assembly Rooms.

Weston-super-Mare.—A special meeting of the School Board was held on Monday afternoon for the purpose of selecting one of the five competitive plans sent in for the new Board school to be erected in the Locking-road. Plan No. 5 received the unanimous approval of the board, and the architects proved to be Messrs. Hans F. Price and S. J. Wilde, of Weston.

Winchester.—At the last meeting of the city council, the public baths committee reported that 24 plans for the proposed baths had been sent in, and they had secured the services of Mr. Jones, of Eling, as assessor to advise the committee upon the monetary awards for the best plans submitted. A short debate ensued as to the desirability of the public inspection of the plans prior to Mr. Jones making his awards, and in the result an amendment was carried by 15 votes to 6 votes that the public be permitted to inspect the plans at once, and the General Purposes Committee were directed to make arrangements for exhibiting the same at the Sessions Hall.

The memorial tower and six cottage homes, which have been built at Mauchline, Ayrshire, as a memorial to the poet Burns, were inaugurated by Mr. J. G. A. Baird, M.P., on Saturday. They have been built from designs by Mr. William Fraser, of Glasgow, and were illustrated in the Building News for Jan. 22, 1897.

CENTRAL FIRE STATION, BOOTLE.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers so complete volume just ended should order at once, at many of them soon run out of print.

RECEIVED.—J. F. C.—Chas. Farrant.—C. P. and Co.—Donald D.—E. C. H.—Perplexed.—N. W.

"BUILDING NEWS" DESIGNING CLUB.

EIGHTH LIST OF SUBJECTS.

H.—A Cottage Home for Waifs and Strays on a level site in the country. This dwelling is to be designed to accommodate 24 poor boys, with rooms for a matron, a nurse, and two servants. There is to be a day-room, 20ft. by 16ft.; dining-room, 24ft. by 18ft.; two dormitories of 12 beds each; a bath-room, with two baths; four water-closets and urinals in an annexe adaptable for day or night use, a box-room, a boot-room, kitchen and scullery, lamp-room and oil-shed. A sitting-room for matron to be provided, and on first floor three bedrooms for the staff and a sick-room for two boys; a bath-room and w.c. also on first floor; servants' w.c. in house yard; pantry and larder; a small play-shed on the south side of the building is to be contrived. The dimensions given may be varied provided the superficial areas in each case are not less than those mentioned herein. Materials: red brick and stone sparingly used, roofs to be tiled, and upper walls may be plastered or tile-hung. Scale, 8ft. to the inch. Plans may be smaller. Sufficient drawings to illustrate the proposed, including a sketch view.

DRAWINGS RECEIVED.—"Centaur," "Byd," "Dachs," "Hotspur," "Pantile."

Correspondence.

MUDDLED, AS USUAL!

To the Editor of the BUILDING NEWS.

SIR,—My filled-in voting paper for the coming election has been returned to me, with the inclosed letter and a stamped envelope, but *no fresh voting list!* This, I understand, is to follow! A triple postage will thus have to be charged upon something like 2,000 papers.

There are this year no less than eleven new candidates whose prospect of success lies chiefly in an increase in the number of voters; but this serious mistake is calculated to deter many voters from taking a further interest in the matter. Last year not more than a fourth of the whole number of members voted.—I am, &c.,

May 11. FELLOW, R.I.B.A.

[COPY.]

DEAR SIR,—An unfortunate error having been discovered in the voting papers, of which printed notice will be sent in a day or two, I beg to return your envelope, together with a fresh one, in case you may have been misled.

In the directions for voting for "Members of Council" at least *eleven* names must be erased, instead of "ten," as printed, so as to return the maximum of eighteen.

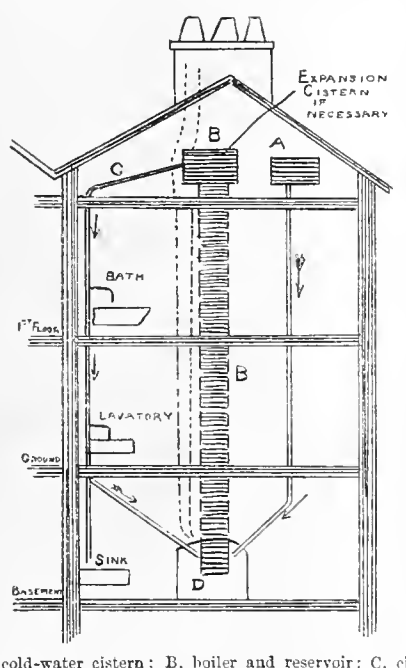
With many apologies for troubling you,—I am, dear Sir, yours faithfully, W. J. LOCKE, Secretary.

9, Conduit-street, London, W., May 10.

Intercommunication.

QUESTIONS.

[11946.]—**Hot-Water System.**—Can some of your correspondents tell me if such a hot-water system as is shown in the accompanying sketch would be effective and satisfactory? I propose to do away with the usual cylinder and pipes to and from it, and to have what is practically an open boiler which shall also be a reservoir for hot water, carried up the whole height of the building, where the water is required, as shown on sketch. The only doubt that I have about the working of such an arrangement is as to the circulation of the water in the long vertical reservoir. Of course, without circulation



A, cold-water cistern; B, boiler and reservoir; C, circulating loop, as is usual; D, kitchen fireplace. The kitchen smoke-flue to be carried up next to the reservoir B.

there would be no hot water. It seems to me that if the method which I have suggested were carried out, there would be no more explosions, as boilers could be carried up straight and left perfectly open and free at the top, and also there would be no pipes to a cylinder to stop up and corrode. I should very much like to hear what a competent person would say about the matter. The idea may not be new, but I have never heard of it before. The system proposed is different to the old and inefficient method of having the hot-water cistern in the roof and connecting it by pipes to the boiler, inasmuch as the boiler is to be carried up the full size, and that there are no pipes. A properly prepared "chase" should be formed in the wall for reception of reservoir; the heat could be utilised.—H. M. X.

[11947.]—**District Surveyor's Duties.**—Is it part of the duty of a district surveyor under the L.C.C. to see that the forecourts of houses abutting on both sides of a new street are kept at the same level, so that when the road and paths are made and taken over by the parish one path and side of such road shall not be higher than the others, or is this the duty of the local authority? Is not the district surveyor concerned solely in seeing that the provisions of the Building Act are complied with? Does the Act of 1894 confer any powers, or place any responsibilities, on district surveyors, as to the levels of new houses abutting on new streets, except, of course, in cases where in marsh districts the site of such houses would be below high-water mark?—COUNCILLOR.

REPLIES.

[11945.]—**Municipal Engineer's Qualifications.**—"A Young Surveyor," not having had municipal experience and desiring to qualify for a municipal engineership, would require a few years' experience in a district [council] or borough surveyor's office, preferably the latter. He should pass the examination of the Municipal and County Engineers' Association. In view of gaining *general* experience, in the first instance, seek an appointment in the office of a surveyor acting for some rapidly-increasing borough or urban district, rather than in a large city, where the work is usually done on strictly departmental lines, which results in training men for one kind of work only. Experienced, capable men of that class have tried for twenty years to secure borough surveyorships in smaller towns without success, although they have been selected candidates on many occasions, just because the least cross-examination as to their experience proved that they possessed but a partial knowledge of the multifarious duties of a borough surveyor, who is expected to be an architect, civil engineer, surveyor, and valuer, possessed of a deep insight into various phases of human nature, and other qualifications innumerable, if he is to succeed. The position is likely to improve.—ONCE AN ASPIRANT TO THE POSITION.

[11940.]—**The New Incandescent Light.**—Like "R. T.," I have got tired of the incandescent lights with mantles. I think he will find the burner he refers to suit him. It is an argand burner, as shown, and has two chimneys, and a small expansion and heating-chamber just below the burner proper. The air supply is heated in passing down between the two chimneys, and the expansion chamber, which is filled with filtering material, aids in heating the gas. The flame is steady and white, but not ghastly white or green. It is supplied by Billing's Burner Syndicate, 180, Wardour-street, W. There is no smoke with the burner, no mantle, and no bother.—PYRAMID.

[11941.]—**Gold Coast.**—Having served several terms of residential service in the Public Works Department on the Gold Coast, West Africa, under the Crown Agents for the Colonies, I shall be glad to furnish accurate information of the duties, life, associates, appertaining to appointments to any gentleman from this country who has serious thoughts of offering himself for a post in the above department. Address by letter (inclosing stamped envelope)—B. A. CHRISTIE, Post Office, Clacton-on-Sea.

CHIPS.

A Local Government Board inspector held an inquiry at Lowestoft on Wednesday in connection with an application of the town council for leave to borrow £1,300 for sea defence works and £2,200 for the purchase of the south beach. Great interest was manifested in the proceedings, the project being keenly opposed by a section of the ratepayers.

The foundation-stone of a new Congregational Church was laid in Prince's-avenue, Spring-bank, Hull, on the 5th inst. It will be cruciform on plan, having a nave of 82ft. in length by 28ft. in width, with north and south transepts 18ft. 8in. and 15ft. 6in. in depth respectively, and 23ft. 6in. in width. The buildings are designed in the Late Gothic style, and the church will be seated so as to accommodate 585 persons on the ground floor, and 68 in the gallery.

At Hales Owen, on Friday, Colonel A. S. Durnford held an inquiry on behalf of the Local Government Board into the application of the district council for sanction to borrow £1,250, for the purchase and adaptation of the police buildings as public offices.

Mr. F. H. Tulloch, M.Inst.C.E., Local Government Board inspector, held an inquiry at the corporation offices, Bank-street, Bury, Lancs, on Thursday in last week, into the application of the Bury Corporation for the Local Government Board's sanction to borrow £25,000 for works of private street improvement. Mr. Cartwright, borough engineer, explained the plans.

Memorial-stones of a Wesleyan Church at Westbourne, Bournemouth, were laid on Wednesday week. The new building, with the schools adjoining, will cost £5,000. Seating accommodation will be provided for about 500 worshippers. The architect is Mr. Curwen, of London; and the builders are Messrs. F. Hoare and Sons, of Bournemouth.

The proposed improvements at Mablethorpe were the subject of a Local Government Board inquiry on Tuesday in last week. The cost of the tunnel head works was estimated at £1,321, the promenade behind the tunnel head at £259, the cab-stands, urinals, &c., £483, and the promenade from the tunnel head to the Pullover at £668, making a total of £2,711. Towards this the contribution of the Commissioners of Sewers will be £800.

The British Institute of Certified Carpenters visited St. Paul's Cathedral on Saturday afternoon. In the evening a meeting was held in the Carpenters' Hall, when Mr. T. M. G. Lloyd read a paper on "Some East Anglian Churches."

The Bewdley Corporation are proposing to reconstruct the wall on the south side of Bewdley Bridge, and to improve the quay. For this purpose they have applied to the Local Government Board for power to expend £1,000 on the work, and on Saturday Colonel Durnford, R.E., held an inquiry into the matter. The town clerk, Mr. Stanley Hemingway, explained what the corporation proposed to do if the expenditure were sanctioned. Mr. Berrington, C.E., gave evidence in support of the application, which was opposed by several residents.

PROFESSIONAL AND TRADE SOCIETIES.

The Artists' Benevolent Institution.—At the Hôtel Metropole on Saturday evening Sir H. Campbell-Banner, M.P., took the chair at the 83rd anniversary dinner in aid of the funds of the Artists' General Benevolent Institution. The list of guests included Sir Wyke Bayliss, Sir J. Tenniel, Mr. Alma Tadema, R.A., Mr. H. W. B. Davis, R.A., Mr. A. Waterhouse, R.A., Mr. Val Prinsep, R.A., Mr. E. A. Waterlow, A.R.A., Mr. W. W. Ouless, R.A., and Mr. Douglas Gordon (secretary). The chairman proposed the toast of the evening, that of "Prosperity to the Artists' General Benevolent Institution." He observed that since it was founded the institution had expended in relief no less a sum than £122,398. Last year £4,095 were distributed in sums varying from £10 to £100 among 234 applicants. Those applicants were all of them artists, not necessarily subscribers to the association. The only claims recognised were those of merit on the one hand and distress on the other. The dignity and self-respect of the recipients of this most proper charity were secured by the fact that their names were not divulged. This immense boon was conferred on the artistic community at a cost for working expenses for the year of only £356. Artists were peculiarly liable to the vicissitudes of life, and it was to meet those vicissitudes that this most beneficent institution has been created. Mr. F. Harrison proposed "The Royal Academy and the Other Societies Connected with the Fine Arts," Mr. H. W. B. Davis and Mr. E. A. Waterlow responding. Mr. Alma Tadema proposed "The Visitors," Mr. Comyns Carr replying, after which Mr. Alfred Waterhouse, R.A., the treasurer, announced a list of subscriptions and donations amounting to nearly £2,000.

Bristol Society of Architects.—The last ordinary meeting of the society for the present session was held at the Fine Arts Academy, Clifton, on Monday, the 9th inst., when a thoroughly practical paper on "Plumbing," by Mr. Geo. Tuckey, was, in his unavoidable absence, read by the President. The "Conditions of Competition and Instructions to Students for Prize Drawings" were read, and it was decided to print same for circulation, together with a letter received from the principal of the Merchant Venturers' Technical College, stating that it was proposed to hold a special course of lectures for students desirous of presenting themselves for the Intermediate Examination of the R.I.B.A. It was decided to requisition a special meeting of the council, to consider the question of revising the society's by laws, so as to provide for the annual election of two Associates on the council.

Crewe and District Master Builders' Association.—The first dinner of this association was held at the Hop Pole Inn, Crewe, on Tuesday in last week, when about forty builders and others sat down, Mr. J. Bebbington, the president, in the chair. Those present included representatives from the Potteries, Middlewich, Northwich, &c. The hon. sec., Mr. E. J. Smith, gave an encouraging report of the progress of the association since its commencement some six months ago, the membership having shown a steady increase. Mr. Smith also spoke of the better feeling created in the building trade throughout the district. Mr. F. Wooldridge proposed "The Town and Trade of Crewe, coupled with the Builders' Association." Mr. G. E. Morgan supported the toast, to which the treasurer (Mr. Micklewright), and Mr. Griffiths responded. Councillor Jones proposed the health of "The Visitors." Mr. J. Atkinson, architect, and Messrs. Longden, Grant, and Cooke responded.

Devon and Exeter Architectural Society.—The annual meeting of this society was held on Saturday at Exeter, under the presidency of Mr. James Hine, F.R.I.B.A., of Plymouth. The annual report was presented by the hon. secretary, Mr. Harbottle Reed. Among other matters it referred to the resolution which had been forwarded to the Exeter City Council with regard to the preservation of the Guildhall, and on receipt of which the corporation had the building examined and reported upon; also to the formation of students' classes, and the forthcoming exhibition of the Institute prize drawings in the Albert Memorial Museum on the 23rd inst. It was stated that the offer of a prize for the best sheet of prepared drawings had this year met with no response. A satisfactory balance-sheet was submitted by Mr. Octavius Rulling, the hon. treasurer, after which the retiring president addressed the meeting. In the course of his remarks he said:—I shall be succeeded by a citizen of your "Ever Faithful" city who will carry out the duties of the chair more constantly and efficiently than I have been able to do. His early work gives me the keynote, then, of the few observations I have to offer. There is no more valuable part of a student's training than the study of good examples of ancient buildings, and the sketching, and, more particularly, the making exact measured drawings of such buildings. The idea of some may be that this tends to make a man a plagiarist; but experience shows that this kind of work gives him a mastery of his art, and a degree of freedom in designing which he would not otherwise possess. The period of pupilage is obviously the time and opportunity for cultivating the artistic side of an architect's work, because—as we have each of us found out—in the actual carrying out of an architect's business he has often to face very practical duties to the exclusion altogether of æsthetic considerations. Loyal, however, to his profession of a noble art, his principal aim will ever be to represent it adequately. It is much to the honour of Mr. Crocker that at the commencement of his professional career he distinguished himself by securing an Institute silver medal for his most admirable set of drawings and details of Exeter Guildhall, and to our hon. secretary (Mr. Harbottle Reed), who was quite recently awarded the Grissell gold medal for his clever design for a wooden church. There is no work so open to criticism—not even parsons' sermons—as the work of architects. Public and private, free and open, candid and spiteful, it lasts for all time, or as long as a building stands, and happy is the architect who is not very thin-skinned. There are two beautiful and picturesque towns in the West of England—Exeter, which was largely the creation of the 16th and 17th centuries, and Bath, which retains the beauty given it by Wood in the last century. Why is it that in the more modern towns, fashionable and unfashionable, which have sprung up during the present century the impress of architecture is so imperfect and unsatisfactory? Because for the most part they have not been the creations or work of architects. This has been a misfortune for our profession; but it has been a greater misfortune for the towns, and has been the occasion of numberless blots on the face of Nature. A vote of thanks to the retiring president was moved by Mr. Crocker. This was seconded by Mr. Arnold Thorne, Barnstaple, and supported by Mr. B. P. Shires, Plymouth, and Mr. James Jerman, Exeter. The following gentlemen were then elected for the ensuing year: President, Mr. James Crocker, F.R.I.B.A.; vice-president, Mr. H. G. Luff, A.R.I.B.A, Devonport; new members of council, Mr. James Jerman, F.R.I.B.A., Mr. S. Dobell, M.S.A., and Mr. B. P. Shires, A.R.I.B.A. The hon. treasurer (Mr. O. Ralling, M.S.A.) and the hon. secretary (Mr. Harbottle Reed, M.S.A.) were re-elected. Votes of thanks were accorded the retiring members of the council (Messrs. C. Cole and E. G. Warren) and the hon. secretary and hon. treasurer. A luncheon was afterwards held at the New London Hotel.

Edinburgh Architectural Association.—The annual meeting of this association was held on the 4th inst. in the Royal Institution, Princes-street, Edinburgh, Mr. Thomas Ross, the president, in the chair. The report of the treasurer showed that the total membership of the association stood at 286, that the total income for the year amounted to £135 10s., and the payments to £134 4s. 11d. The secretary stated that in connection with the memorial which they had presented to General Sir R. Murdoch Smith, suggesting that the Museum of Science and Art might remain open between four and six o'clock on Saturday afternoons—which two hours would be very useful to architects, artists, and others for sketching purposes—he had received a communication from Sir Murdoch Smith to the effect that he had submitted the memorial to the Lords Committee of Council on Education, with a recommendation that the request therein set forth he acceded to. The president intimated that the Hon. Hew Dalrymple, on behalf of the Ayr and Galloway Archæological Association, had presented the association with a set of their *Proceedings*, amounting to fourteen volumes—a valuable gift. Mr. Ross was re-elected president; Messrs. John Watson and James Bruce, were re-elected vice-presidents; and Messrs. T. Fairbairn, A. Hunter Crawford, and J. Johnston, C.A., were re-elected secretary, excursion secretary, and treasurer respectively. The president afterwards delivered his valedictory address, the subject of which was "Lesser Known Churches of Scotland." Mr. Ross, whose address was illustrated by many beautiful limelight views, began with the earlier Norman churches, such as Leuchars, Dalmeny, and Tyninghame; next he directed attention to the elaborate church towers at Dunning, Muthill, and elsewhere in the district of the Tay; and dealing lastly with later churches, Mr. Ross gave a full exposition of the collegiate churches, of which he said there were somewhere between thirty and forty in Scotland, and which were all in the Late Scottish Gothic style, and were, perhaps, the most national works they had, without any affinity whatever to English work. The association visited on Saturday afternoon the mansion-house of Craigie Hall, under the leadership of Mr. John Watson, architect. The party proceeded up the Almond to the "Temple," a circular belvedere, of which the upper story is now a museum, containing antique busts, figures, &c., brought from Italy. The unique bath-house in the grounds, erected in 1747, was next visited. The bath in the basement was supplied from the Almond, and the dressing-room on the ground floor is profusely decorated with ornaments of shells arranged in architectural forms. At the mansion-house Mr. Watson described the building as a most interesting and fine example of the architecture of the end of the 17th century.

Edinburgh Architectural Society.—At a meeting of the above Society, held on Wednesday in last week in Dowell's Rooms—Mr. William N. Cumming, A.R.I.B.A., in the chair—a lecture was delivered by Mr. A. N. Paterson, M.A., A.R.I.B.A., entitled "Evolution of the House: the Modern Product." Mr. Paterson arranged his lecture under three heads—(1) The modern house; (2) the country house; (3) the town house. Particular attention was given to aspect versus prospect in the planning of the mansion, the smaller country house or villa, and the cottage. In dealing with the town house, the limitation of light, air, and area were gone into, and in overcoming these the American style of planning was referred to.

Glasgow Architectural Association.—The usual monthly meeting was held in the rooms, 187, Pitt-street, on Tuesday, the president (Mr. W. T. Conner) in the chair, when Mr. Oscar Paterson, Glasgow Art Workers' Guild, and lecturer on Technology of Glass, City and Guilds of London Institute, &c., read a paper entitled "About Stained Glass." Treating the art side of the question, he summed up the salient points thus:—"Circumstance of material governed the art of stained glass in its first stages of development. As 'art' progressed with a greater force than 'industry,' stained glass was more or less trammelled by difficulties of material; but when a certain progress and facility was attained, each craftman followed out his art on the lines of his taste, temperament, or circumstance. Every stage of industrial progress is indicated in the development of stained glass, the most marvellous being in the present century." The practical side in the design he explained on slides illustrating old and modern work. At the close a hearty vote of thanks was passed.

Sanitary Inspectors' Association.—At a general meeting of the members of this association, held on Saturday evening at Carpenters' Hall, London Wall, E.C., Mr. T. G. Dee in the chair, Mr. W. Wilkinson read a paper on "Dangers to Health arising from Defective Sanitation." He observed that defective sanitation, as represented by badly designed structures, inefficient workmanship, and defective materials, produced, amongst other evils detrimental to health, typhoid and enteric and continued fevers, with diphtheria. The habits of the people with respect to cleanliness, and more especially with respect to their care to protect their habitations from pollution by excrementitious matter, were a clear indication of their progress in civilisation. It was a deplorable proof of the want of information and of due appreciation of the circumstances on which the improvement of the moral as well as the physical condition of the population depended that the existence of filth in houses and towns, the prevalence of filthy habits among the people, and the efforts to remedy or mitigate the attendant evils were often treated with the

greatest contempt, as if the subject were of no consequence, or fitted only to excite disgust. It might not be needful that persons on whom no duties in that direction devolved should enter closely into the details in question; but it was incumbent upon the local administration of the law for improving the sanitary condition of the people to show by their manner of dealing with its provisions that they regarded them as the practical fulfilment of the primitive ordinances for personal and household purification. It was important that they should treat even the minutest and most repulsive details with the same scrupulous and anxious care that physicians dealt with the most offensive particulars attending upon sickness, suffering, and mortal disease. In conclusion, the lecturer expressed the hope that, with reference to the Local Government Board inquiries in all matters relative to sanitation whether of sewers, scavenging, or outfall works, the time was not far distant when that board would recognise the work of the Sanitary Inspectors' Association by electing from its ranks a representative to conduct or assist in conducting these inquiries.

CHIPS.

Mr. C. Hodgson Fowler, F.S.A., of Durham, has been appointed architect to the cathedral of Rochester, in succession to the late Mr. J. L. Pearson, R.A. Among his other appointments Mr. Fowler has been architect to the diocese of York for some time.

A fire which did damage to the extent of some £25,000 occurred at Edinburgh on Wednesday night, in the large horticultural buildings, manufactory, and engineering works of Messrs. Mackenzie and Moeur.

The Governors of St. Bartholomew's Hospital are in negotiation with the Council of Almoners of Christ's Hospital, with a view to acquiring a quarter of the total area of five and a-quarter acres, and it is probable that the remainder will be purchased by a railway company for the purpose of a City terminus.

Lord Masham has offered to place at the disposal of the Mayor of Bradford a sum of from thirty to forty thousand pounds for the purpose of erecting an institute on the site of his old home in Manningham Park, Bradford, which is now public property. He has also suggested that an attempt should be made to get a national memorial to Dr. Cartwright, the inventor of the power loom, and expressed his willingness to assist in that project. A committee has been formed to deal with the suggestions.

Cardinal Vaughan will lay the foundation-stone of the new Roman Catholic church at Ilford, to-morrow (Saturday), at four p.m.

The County Council for East Sussex, at their meeting on Tuesday, received the resignation of Mr. H. Card, of Lewes. In accepting the resignation, reference was made to the efficient services Mr. Card has rendered the council for nearly half a century, and it was decided to appoint him as consulting engineer at a salary of £200 a year. Notice was given of a resolution to be passed at the next meeting expressive of the council's appreciation of Mr. Card's valuable services.

Alterations are being made to Wallingford boys' school, embracing the ventilation, which will now be carried out on the Boyle system.

Mr. E. A. M. Sandford Fawcett, A.M.I.C.E., inspector of the Local Government Board, attended at the Moot Hall, Aldeburgh, on Thursday in last week, to hold an inquiry in reference to an application by the town council of that borough for the sanction of the Board to a loan of £11,000 for the purposes of sewerage and sewage disposal.

The health committee of the Liverpool Corporation recommend that Mr. James Morgan, chief surveyor of roads, whose present salary is £400 per annum, be appointed deputy city engineer, at a salary of £500 per annum.

On Saturday an inquest was held at Horseley relative to the death of Edward Avery (47), foreman at Horseley Works, where he received fatal injuries on the previous Thursday. Alfred Purnell, an employé, stated that on Thursday deceased was engaged superintending the lowering of the principal of a roof in course of construction. A girder was being lowered by a derrick, when the back guide-rope broke, throwing the weight on the other two ropes. This caused the girder to swerve, and one end of it struck deceased in the back. The rope, which was about 1in. thick, had been in use about a month. James Dunn, works manager, said deceased had been a foreman for six or seven years. Ropes were used as guides for derrick purposes, but chains were always employed for lifting. The jury, in returning a verdict of "Accidental death," recommended that some method of testing derrick-ropes be adopted in future.

Our Office Table.

WE understand that the choice of names made by the council of the Royal Institute of British Architects, under the chairmanship of Professor Aitchison, has been submitted to the Minister of Public Works, and the following gentlemen, if the Government approves of the selection thus arrived at, will, it is said, be invited to design the elevations for the new War Office in Parliament-street. It is to be noted, if this is the case, that out of the eight architects thought worthy of the honour two only are Englishmen, three are Scotch, and three are Irishmen. We give them in this order of nationality—viz., Messrs. John Belcher and Charles Barry, Messrs. J. M. Brydon, Wm. Young, and John Burnet; Messrs. Thomas Drew, R.H.A., and W. H. Lynn, R.H.A., and Sir T. N. Deane, R.H.A. The two last named are the only two proposed competitors who are not Fellows of the Royal Institute. It was understood that the selection would be made mainly on consideration of the successful buildings actually erected by the competitors in a *Classic style* of architecture. We make no further comment.

MR. C. B. BRODIE, A.R.I.B.A., has addressed a moderately-worded open letter to the council and members of the Institute of Architects, suggesting the desirability of a limitation of the term of office for members of council of that body. He says there seems some justification for the assertion that the council has become a sort of close corporation, the members of which nominate each other constantly. Taking the nomination list just issued by the council, Mr. Brodie finds that 25 out of the 38 members of the council nominated are "starred" as being members of that body. This would show 26, because Mr. Hampden W. Pratt is now a member, whilst Mr. E. T. Hall, Mr. Beresford Pite, Mr. J. S. Gibson, and Mr. Leonard Stokes have all previously served, so that brings the total to 30 old members of council nominated out of 38 names on the list of ordinary members. One main reason Mr. Brodie thinks why the London Architectural Association is becoming proverbial for its rejuvenescence, while it stands pre-eminent for life, energy, and progress in the profession, is because the bylaws allow only a certain number of the old committee to be re-elected each year, and provide that no member may sit on the committee as an ordinary member for more than three successive sessions. This would probably be too short a term for the Institute, but he urges that some limit should be put. Referring again to the nomination list just issued, among those nominated, one has been a member of council for 14 consecutive sessions, another for 13, two for 12, two for 11, two for 10, two for 9, two for 8, and one for 7—all consecutive sessions. One member, now renominated for a seat on the council, was on it as long ago as 1881. Mr. Brodie pertinently suggests that now that the bylaws are being amended, the opportunity should be seized to insert a limitation of term of office.

THE great revival of appreciation of the works of the 18th-century painters, and which has been recently evidenced by the very high prices paid in the auction rooms, even for their engravings, makes the exhibition which the Fine Art Society will open on the 16th inst. in New Bond-street of exceptional interest, for it will include not only a large number of the miniatures but nearly 50 of the full-length drawings of Cosway, some forty of Downman's fascinating profiles of 18th-century beauties, and some of the finest extant specimens of Plimer, Smart, Engleheart, and the pick of the miniaturists of that time. The collection, which includes some 300 numbers, has been many years in formation, and has been made by an expert having exceptional opportunities of acquiring undoubted specimens. The introduction to the catalogue will be written by Dr. Lumsden Propert.

"THE LIFE WORK OF MR. WILLIAM MORRIS" was the subject of an address delivered on Tuesday afternoon before the Applied Art Section of the Society of Arts, Dr. Richard Garnett, C.B., presiding, by Mr. F. S. Ellis. The lecturer described Morris's career as not only wonderful but unique. While possessed of a versatile genius, William Morris was one of the most humble-minded of men. It spoke volumes for his vigour and hopefulness that he ventured to set forth, so to speak single-handed, on the task of awakening people to a sense of the hideousness that surrounded them and the possibility of something more artistic and beautiful. But for the life work of Morris the amelioration of commonplace ugliness, which might be traced in thousands of houses, would never have come about. In regard to his connection with the Socialistic movement, once convinced of the justice of the cause, he cast aside all considerations of personal taste, ease, and comfort, doing violence to his own feelings and predilections, and forcing himself to personal work and labour that were absolutely distasteful to him. Never did any man give himself to a cause with purer unselfishness and more hearty devotion. In his later years, though he did not alter his opinions, it appeared that he was satisfied that any chance of forcing on a sudden change was altogether hopeless.

MR. E. M. BELOE, JUN., of King's Lynn, Norfolk, whose rubbings of Norfolk brasses we noticed in these pages some seven years since, has now published a set of eight plates in illustration of the monumental brasses in Westminster Abbey, small folio size. The frontispiece is a well-executed chromo-lithograph of a fragment of a tomb, probably erected to a son of William de Valence, showing eight Lombardic letters in brass and original mosaics in red, white, and gold. The four letters R L E A are suggested as a portion of the surname "Varleance." The plate has been produced from a water-colour by Miss E. M. Vincent. Sir Gilbert Scott uncovered the slab of this monument from under a step in the Confessor's Chapel. The brasses given by Mr. Beloe are of John de Waltham, Bishop of Salisbury, Lord High Treasurer, 1395; Robert de Waldeby, Archbishop of York, 1397; Alianore de Bohun, widow of Thomas Woodstock, son of Edward III., 1397; Sir John Harpedon, 1437; Abbot John Estney, 1498; Sir Humfrey Stanley, body-guardsman to King Henry VII., 1505; fragments of brasses to Sir Thomas Vaughan, 1483, and Sir Humfrey Bourgchier, who was killed at the battle of Barnet, 1471. The last plate also gives three examples. The only rubbing on this sheet is of William Bill, Chief Almoner to Queen Elizabeth, and Dean of Westminster, 1561. The other illustrations are of the slab still in the Chapel of St. Andrew to Edmund Kirton Abbot, 1466, from Gough's "Sepulchral Monuments in Great Britain," and of the slab to Thomas Woodstock, before mentioned, who died in 1397. The monument is to be seen in the Confessor's Chapel. From this index list it will be seen that Mr. Beloe has added some very remarkable historic examples to the published rubbings of old English brasses, which never fail to interest a large number of readers who are glad to increase their acquaintance with the archæology of the subject and add to their knowledge of Mediæval costume and monuments of distinguished personages.

THE annual meeting of the members of the District Council for Edinburgh and the East of Scotland of the National Registration of Plumbers was held on Friday night in Dowell's Rooms, Edinburgh, Sir James Russell presiding. The report, which was read by Mr. James Marchbank, the secretary, stated that there was a larger membership than the previous year, while the financial statement showed that the year began with a debit balance of £35, and ended with a favourable balance of £18 9s. With regard to the Plumbers' Registration Bill, the measure had been amended considerably, and every effort would be made to have it passed through Parliament. The chairman said the Plumbers' Registration Bill, as they had heard, was very greatly improved, but the prospects of a private Bill this session were extremely bad. Every year that the measure had been shown to the House it had been a better Bill. It was, however, an unfortunate thing for the public health, not to speak of the plumbing craft, that its passage through Parliament was so difficult. Nothing but the general education of the public had ever led to the passing of any Bill relating to public health. The report was adopted. Sir Douglas Maclagan was re-elected honorary president, and Sir James Russell president.

THE excessive draught in the Bristol Council Chamber has led to inquiries, which have resulted, according to the *Bristol Mercury*, in the explanation that the special electrical ventilation apparatus provided on the plan of Professor Wertheimer has never had a real chance of justice being done to it. This arises from the fact that it is so scientifically arranged and

adjusted for precise conditions that the moment these conditions are broken the delicate arrangement of the apparatus is dislocated, and its effect entirely lost. It is stated that it was designed for a room with closed doors, and the ordinary ventilators in the walls of the hall, intended to admit fresh air, should be left open. But the practice is for all these ventilators to be closed, as the room is felt to be too cold, and then only too often the doors at the extreme end are thrown open. Immediately these conditions prevail, the whole effect of the electric ventilator is subverted, with the result that an insufferable draught is generated. This, it is contended, is entirely brought about by upsetting all the scientific conditions to which the new ventilator of Professor Wertheimer will alone apply.

MESSRS. WM. R. NICHOLAS AND CO., of 60, Pall Mall, S.W., advertise in our columns that they will sell by auction, in lots, on June 7, a valuable building estate at Newmarket on a new and easy way as regards payment. Instead of paying the whole of his purchase money at once, Messrs. W. R. Nicholas and Co. have arranged that the purchaser may extend it over a term of 10 years, by instalments. The land appears to be anything but a "white elephant." On the contrary, it is situated adjoining the Great Eastern Railway station at Newmarket, and is stated to be the most valuable for building purposes ever likely to come into the market in the Metropolis of the Turf.

CHIPS.

The electricity committee of Glasgow Town Council have approved generally of the report by Mr. W. A. Chamen, epitomised by us last week p. 657, for the supply of electricity within the municipal area. The expenditure involved is half a million.

The Lynton and Barnstaple Railway was opened on Wednesday. The line is 19½ miles long, and is connected with the London and South-Western system.

There was a diminution of supply at the Auction Mart last week. The aggregate realisation was £119,107, considerably less than that registered in the corresponding week of last year—£142,874. The demand, however, was quite up to the average, and few good investments were passed by. Landed estate is still conspicuously absent from the market, but there are indications of improved business in this direction after Whitsuntide.

An application having been made by the Little Crosby Urban District Council to the Local Government Board for powers to borrow a sum of £3,000 for purposes of street improvements, an inquiry conducted by Mr. Tulloch, M.I.C.E., was held on Friday, at Little Crosby Hall. Mr. Thomas Dixon, surveyor to the urban district council, explained the proposals.

On Thursday in last week, Col. A. J. Hepper, D.S.O., R.E., an inspector of the Local Government Board, held an inquiry at the town-hall, Tunstall, in reference to an application by the urban district council for sanction to borrow £350 for the purchase of land for the purposes of street improvements. Particulars of the scheme were supplied the inspector by Mr. A. P. Llewellyn (clerk) and Mr. A. R. Wood (surveyor), showing that it was proposed to acquire part of the site of the Globe Pottery, at the corner of High-street and Amicable-street, and to carry out a widening of these thoroughfares.

The death is announced of Mr. John Mackay, railway contractor, at the residence of his son-in-law, Nether Wellwood, Muirkirk. Mr. Mackay was the oldest Scottish railway contractor, and was present at the cutting of the first turf on the old Edinburgh and Glasgow railway. His largest contracts were for the making of the Highland line from Dunkeld to Kingussie, Callander and Oban, and Stobcross and Wishaw Central.

Lord Ashcombe, on Saturday, laid the foundation-stone of a new church on Cranleigh Common, near Guildford, which is being erected in commemoration of the 60 years' reign of her Majesty.

The joint committee of the East and West Riding County Councils of Yorkshire have taken Manor Farm, Garforth, near Leeds, on a term of years for the purpose of technical instruction in farming. Plans are now being prepared by Mr. Joseph Shepherdson, architect, Driffield and Hull, for a new set of buildings, which are to be erected forthwith.

Mr. William Lindley Catlin, late clerk of works of the Haverhill (Suffolk) Waterworks, has been appointed engineer and manager of the Faversham Water Company, Ltd., in place of Mr. Robert Darney (resigned), who has held the post since 1863.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—St. Paul's Ecclesiological Society. Visit to churches of Perivale and Greenford, under guidance of H. Roumieu Gough, F.R.I.B.A. Book by District Railway Company train due at Ealing at 3.30 p.m.

MONDAY.—Society of Arts. "Electric Traction," Cantor Lecture No. 3, by Professor C. E. Carus Wilson, of McGill University, Montreal. 8 p.m.
Royal Institute of British Architects. "The Libraries of the Middle Ages," by T. G. Jackson, R.A. 8 p.m.
Surveyors' Institute. "Comparative Values of Cattle Foods: Chemist versus Valuer," by H. T. Eve. 8 p.m.

TUESDAY.—British Association of Waterworks Engineers. Annual Five Days' Meeting at Southampton. Proceedings to be opened 10.30 a.m.

WEDNESDAY.—Society of Arts. "The Evolution of the Cycle," by J. K. Starley. 8 p.m.
British Association of Waterworks Engineers. Meeting at Southampton. Papers and Discussions, 10 a.m. Annual Dinner, 7.30 p.m., at Dolphin Hotel.
The Edinburgh Architectural Society. "Church Decoration in Norfolk," by Alfred Greig. 8 p.m.

THURSDAY.—Home Arts and Industries Association. Fourteenth Annual Exhibition at Royal Albert Hall. 2.30 p.m.
Society of Arts. "Chartered Companies and Colonisation," by Sir Alfred C. Lyall, S.C.I.E., K.C.B. 4.30 p.m.
British Association of Waterworks Engineers. Meeting at Southampton. Papers and Discussions. 10 a.m.

FRIDAY.—Architectural Association. "Foundations for London Buildings and Riverside Foundations," by A. S. Walmisley. 7.30 p.m.
British Association of Waterworks Engineers. Leave Docks Railway Station, 9 a.m., for Fareham, to visit the Gosport and Portsmouth Water Supply Works.

THE ARCHITECTURAL ASSOCIATION.

MAY 20th, ORDINARY MEETING, 9, Conduit-street, W., 7.30 p.m. Mr. A. T. WALMISLEY, on "FOUNDATIONS AS APPLIED TO LONDON BUILDINGS, AND RIVERSIDE FOUNDATIONS."
Election of Officers for Session 1898-99.
MAY 21st, SPRING VISIT to Grove Hospital, Tooting; Mr. A. H. Tiltman, Architect. Meet at 3.30 p.m. Trains leave Ludgate Hill for Tooting Junction at 2.54.

E. HOWLEY SIM }
G. B. CARVILL } Hon. Secs.

Trade News.

WAGES MOVEMENTS.

ARBITRATION IN THE NORTH STAFFORDSHIRE BUILDING TRADE.—The members of the Potteries, Newcastle, and Leek branch of the Operative Bricklayers' Association having made a demand for an increase of a penny upon the present rate of 8½d. per hour, and the Master Builders' Association having refused to accede to such demand, the dispute has been referred to Mr. Talbot Baines, an arbitrator of the Board of Trade. The case for the applicants is that they considered the advance of a farthing per hour granted by Sir W. Markby in 1896 hardly enough under the circumstances, and, having submitted to that decision for two years, they thought that they were justified, in the present state of the building trade, in again asking for a revision of the scale. The case for the builders is that there has been no such change in the trade as to justify the demand made by the bricklayers, and that such demand has been made because the bricklayers thought it was possible that they themselves would receive a notice for reduction of wages from the employers. The stonemasons and bricklayers' labourers had also asked for an increase of 1d. an hour, but the former had accepted ½d., making their wages equal to those of the joiners and bricklayers, and the latter had withdrawn their notices. At an inquiry into the dispute, held at Stoke-on-Trent, the arbitrator endeavoured to effect an amicable settlement, but failed. He said he would give the subject his full consideration and forward his decision in due course.

BANGOR.—The joiners who, a fortnight ago, went on strike for an increase of wages, resumed work on Tuesday, the employers acceding to the demand of 6½d. per hour. The building trade in the district is very brisk.

BURTON-ON-TRENT.—It was officially stated on Friday that the strike of painters had terminated. The men, who have been out since the 1st of April, asked for an increase of ½d. per hour, their present rate of payment being 7d., and a revision of the rule as to out-of-town work. A compromise was effected on Friday, by which the men agree to accept an increase of ½d. per hour, while expenses are to be allowed for Sunday when the men are engaged away from the town. Both sides express much gratification at the issue.

CATERHAM.—The trouble in the building trade was settled on Friday, the master builders conceding a halfpenny per hour advance, with a code of working rules to carpenters and bricklayers from May 2.

FAREHAM.—The threatened trouble in the building trade has been averted, except in the case of labourers. The men, at a meeting of the general trades, asked for an increase of 1d. per hour, and to cease work at 1 p.m. on Saturdays instead of at four. In the case of the bricklayers, carpenters, and painters, the demands have been conceded; but in the case of the labourers the request has not been complied with in some cases, so that the men went on strike.

HARTLEPOOL.—The house joiners in the employ of Mr. John Burn, one of the largest builders in the Hartlepools using Canadian-made doors and window frames, are on strike. The Employers' Association have the strike under consideration, and threaten to lock-out the whole of the workmen if those on strike do not return to work. This the latter refuse to do, and it is feared a lock-out, which will extend over the whole of the North of England, will ensue.

LANCASTER.—About 270 stonemasons have ceased work at Lancaster because the masters desire to amend the rules, according to notice, which will reduce the working hours half an hour per morning in the first week of February. The men got an advance of ½d. per hour last year, making their wages 9d. per hour, and the masters say that they cannot see to work before 7.30 until the second week in February. The employers are nearly all connected with the recently formed Building Trades' Federation of Lancashire and Cheshire.

ST. ALBANS.—The carpenters of this city have made a demand for an increase of 1d. per hour in wages.

TEIGNMOUTH.—One firm of builders have decided to give their men an extra ½d. per hour without any application from the men. It is expected that other employers will do the same.

WEST BROMWICH.—About 150 youths and girls in the employ of Messrs. Hamblett came out on Monday for an increase in their wages. Other brick manufacturers in the West Bromwich district have received the usual seven days' notice from the youths and girls in their employ to terminate their engagements unless their demands are conceded.

The reopening of the new wing to Salisbury School, erected at a cost of over £2,000, took place on Monday.

The foundation-stone of the new town-hall for Enniskillen was laid on Monday in last week. The building, which was illustrated by a double-page perspective and plans of two floors in our issue of Dec. 17, 1897, is being erected from designs by Messrs. A. Scott and Son, selected in competition. It will be faced with Carrick Creagh limestone, with designs of Dungannon sandstone. Mr. James Harvey, of Enniskillen, is the builder.

Operations have been started this week for the underpinning of the north-eastern corner of the Eastern Chapel of Peterborough Cathedral. Although the excavation has, up to the present time, not been carried to a very great depth, yet many pieces of tooled masonry belonging to the abbey have been found. Passing in a north-easterly direction at this point was the ancient dyke which bounded the Saxon church of the Peterborough of that day. It is believed that the subsidence of the corner of this chapel is partly due to the foundations having been placed in this ditch.

Mr. D. M. F. Gaskin, M.Inst.C.E., civil and consulting engineer, has been appointed as the consulting engineer to the Newton-in-Makerfield Urban District Council. Mr. Gaskin is an old Liverpool Corporation official, and served under Mr. Thomas Duncanson and Mr. G. F. Deacon.

A loan of £5,130 has been granted to the Greenwich District Board of Works by the London County Council for the purchase of a site for a parish yard in Blackwall-lane.

LIST OF COMPETITIONS OPEN.

Wrexham—Proposed New Boys' and Girls' Schools at Grove Park (cost about £8,000)	£50 (merged), £25	W. R. Evans, 56, Hope-street, Wrexham	May 18
Tipton—Laying Out Park (£4 per limit	£25 (merged), £10	John W. Waring, Clerk, Public Offices, Tipton	,, 25
Trowbridge—Technical School (£5,000 limit: Mr. E. W. Mountford, F.R.I.B.A., Assessor	£40 (and 5 per cent. com.), £30, £20	H. Ledbury, Sec., Castle-street, Trowbridge, Wilts	,, 28
Cricklade—Water-Supply Schemes	£21, £10 10s.	Harry Bevin, Clerk R.D.C., Union Offices, Wootton Bassett	,, 31
Wallsend—Laying-out Park	£50, £20	W. S. Daglish, Clerk, 28, Sandhill, Newcastle-on-Tyne	June 1
Pendlebury Three Chapels, Offices, Lodge, Entrance Gates, and Boundary Walk, at proposed Cemetery	£50 (merged), £30, £20	Samuel Brown, Town Clerk, Town Hall, Salford	,, 7
East Ham—Public Offices, Library & Technical Institute, Fire-Engine Station, Public Baths, and Offices (cost about £55,000)	£105 (merged), £52 10s.	C. E. Wilson, Clerk U.D.C., Public Offices, East Ham, E.	,, 24
Bridlington Quay—Orphanage and Convalescent Home, St. John's-avenue (cost about £1,500)	£25, £10	George Abbott, Secretary, 222, Solly-street, Sheffield	,, 30
Formby—Sewerage of a Portion of the Township	£100, £50, £25	J. H. Havelock Sutton, Surveyor, Piercefield-road, Formby	July 1
Warrington—Police Station, Court House, &c.	£100, £50, £25	J. Lyon Whittle, Clerk, Town Hall, Warrington	,, 2
Stockholm City Railway Stations and Junctions	£656, £438, £219	Consulate General, 27, Great Winchester-street, E.C.	Aug. 31

LIST OF TENDERS OPEN.

BUILDINGS.

Pudsey—Twelve Terrace Houses at South Parade	Leeds Industrial Co-operative Socy.	Herbert Hodgson, A.R.I.B.A., Old Bank Chambers, Bradford	May 14
Willenhall—Infant School	Willenhall & Bentley School Board.	Joseph P. Baker, Architect, 33, Market-place, Willenhall	,, 14
Paisley—Mossvale Public School (1,200 Scholars)	School Board	Macrobert and Hutchison, Clerks to Board, County Buildngs, Paisley	,, 14
Turriff—Houses at Mosside, Cloddach, and Castlehill		James Duncan and Son, Architects, Turriff	,, 14
Downpatrick—Additions at the County Infirmary	Governors	The County Surveyor, Downpatrick	,, 14
King's Lynn—Rebuilding Premises, High-street	G. Kendrick and Son	William Jarvis, Architect, Market-square, Lynn	,, 14
Hoylake—Station Buildings	Wirrall Railway Company	W. M. Law, Surveyor, 3, Lord-street, Liverpool	,, 14
Brotton—Two Houses	J. Faulkner	Arthur F. Newsome, M.S.A., Architect, Middlesbrough	,, 14
London, E.C.—Foundations for Third Section of Parcel Depot, Mount Pleasant	Commissioners of H.M. Works	Hon. Reginald B. Brett, Secretary, 12, Whitehall-place, S.W.	,, 16
Accrington—St. Mary's Infant School	Vicar	Hy. Ross, Architect, 13, Cannon-street, Accrington	,, 16
Yetholm—Residence, with Stabling	Alexander Roger, M.B.	Todd and Thorpe, C.E., County Bdgs., Land of Green Ginger, Hull	,, 16
Great Hampton—Four Pairs of Cottages		Saml. Summers, Great Hampton, Evesham	,, 16

Garlands—House for Private Patients	Cumberland Asylum	Geo. Dale Oliver, County Architect, 5, Lowther-street, Carlisle	,, 16
Leeds—Laundry Buildings & Carpet-Beating Works, Aire-pl.	Leeds Laundry Co.	Johnstone Bros., Architects, 39, Lowther-street, Carlisle	,, 16
Aintree—Six Shops, Longmoor-lane		W. P. Hartley, Aintree, Liverpool	,, 16
Castleford—Two Houses, Smawthorne-lane	J. Webster	Arthur Hartley, Architect, Carlton Chambers, Castleford	,, 16
Southampton—Municipal Lodging House	Corporation	G. B. Nalder, Town Clerk, Southampton	,, 16
Fowey—Premises, Little Fore-street	Fowey Wine Company	Graham and Graham, Solicitors, Fowey, Cornwall	,, 16
Wednesbury—Fire Station	Corporation	E. Martin Scott, Borough Engineer, Town Hall, Wednesbury	,, 16
Cork—Converting Stores into Stables, Lower George-street		James F. M'Mullen, M.S.A., Architect, 30, South Mall, Cork	,, 16
Tynemouth—Market Shed, Fish Quay	Corporation	John F. Smilie, Borough Surveyor, Tynemouth	,, 17
Croydon—Store and Workshop Buildings, Factory-lane	Town Council	E. Mawdesley, Town Clerk, Town Hall, Croydon	,, 17
Bury—Works in Butcher-lane and Chapel-street	Kay and Wilkinson	D. Hardman, Architect, Silver-street, Bury	,, 17
Cross Keys—Four Cottages	Great Western Railway Co.	G. K. Mills, Secretary, Paddington Station, London	,, 17
Ipswich—Classroom, California School	School Board	J. Hepburn Hume, Clerk, Tower House, Tower-street, Ipswich	,, 17
Castle Hill—Seven Coal Offices	Great Western Railway Co.	G. K. Mills, Secretary, Paddington Station, London	,, 17
Highfield, Herts—Two Pairs Semi-detached Villas		F. G. Barnes, Glebe Cottages, Hatfield	,, 18
Patricroft—Workhouse Infirmary	Barton-upon-Irwell Guardians	J. W. Whitworth, Clerk, Union Offices, Patricroft	,, 18
Hatfield—Two Pairs of Semi-Detached Villas		F. G. Barnes, Glebe Cottages, Hatfield	,, 18
Broughton Moor—Cottage	William Mossop	Bowman Eilbeck, Broughton, Cumberland	,, 18
Wakefield—Workshops and Office, King-street	Corporation	Richard Porter, City Surveyor, Town Hall, Wakefield	,, 18
Leeds—Two Villas at Gledhow Park		W. H. and A. Sugden, Architects, Keighley	,, 19
Oakham—Provender Stores	Midland Railway Co.	James Williams, Secretary, Derby	,, 19
Marsden—Five Shops and Houses, Ready Carr-lane		John Kirk and Sons, Architect, Huddersfield	,, 19
Bristol—Clerk's Offices, St. Peter's Hospital	Guardians	J. J. Simpson, Clerk, St. Peter's Hospital, Bristol	,, 19
Lancaster—South Wing to Royal Albert Asylum		Austin and Paley, Architects, Castle Hill, Lancaster	,, 19
Banstead—Drill-Hall and Gymnasium at School	Managers	Cecil Sharp, Architect, 59, Fenchurch-street, E.C.	,, 20
Rathcoole—Repairs to Residence	Celbridge Union Guardians	J. McDonnell, Architect, 33, Kildare-street, Dublin	,, 20
Kinloss—Cottage		Charles C. Doig, Architect, Elgin	,, 20
Berwick—Terrace of Houses	R. J. Atkinson	Parade View, Berwick	,, 21
Annan—Slaughter-House	Burgh Commissioners	Murray Little, Clerk, Town Hall, Annan	,, 21
Kingswood—Two Shops, Moravian-road		Henry M. Bennett, Architect, 36, Corn-street, Bristol	,, 21
Wakefield—Boiler-House and Engine-Room at Asylum	Committee	J. Vickers Edwards, County Surveyor, Wakefield	,, 21
Earlestown—Mortuary	Newton-in-Makerfield U.D.C.	W. W. Shirley, Clerk, Town Hall, Earlestown	,, 21
Money Meary, Draperstown—New Church	Rev. P. Grant, P.P.	E. J. Toye, Architect, Londonderry	,, 21
Leeds—Shoe Factory in Kirkstall-road		Percy Robinson, Architect, 72, Albion-street, Leeds	,, 23
East Ham—Board Offices and Pupil Teachers' Centre	School Board	W. J. Brett, Clerk, 1, Lichfield-terrace, Upton Park	,, 23
Leeds—Five-Story Warehouse, Grace-street	Bainbridge and Co.	Thomas Winn, Architect, 92, Albion-street, Leeds	,, 23
Hastings—Additions, Silverhill School	School Board	H. Tendall, Clerk, 4, Bank-buildings, Hastings	,, 23
Leeds—Ten Small Houses, Derwent-avenue		City Engineer's Office, Municipal Buildings, Leeds	,, 23
Wakefield—Sewage Well and Engine-House, Calder Vale	Corporation	R. Porter, C.E., City Engineer, Town Hall, Wakefield	,, 23
Uxbridge—Foreman's House at Sewage Works	Urban District Council	William L. Eves, Surveyor, 54, High-street, Uxbridge	,, 23
Leeds—Alteration of Blue Bell Hotel	F. A. Cliff	Thomas Winn, Architect, 92, Albion-street, Leeds	,, 23
Huddersfield—Brick Culvert (1,593 lin. yards)	Corporation	Town Clerk, Town Hall, Huddersfield	,, 24
Ilford—Cemetery Works	City of London Burial Board	H. Montague Bates, Clerk, Guildhall, E.C.	,, 24
Bandon—Additions to Presentation Convent		M. A. Hennessy, Architect, 74, South Mall, Cork	,, 24
Humberstone—Superstructure of New Buildings at Asylum	Committee of Visitors	George T. Hine, F.R.I.B.A., 35, Parliament-st., Westminster, S.W.	,, 24
Farnham—Infirmary at Workhouse	Guardians	Ernest Crundwell, Clerk, South-street, Farnham	,, 25
Huddersfield—Surgery in Brunswick-street		John Kirk and Sons, Architects, Huddersfield	,, 25
Ugborough—Enlargement of Infant School	School Board	Edward Windeatt, Clerk, 19, High-street, Totnes	,, 26
Darwen—Electricity Supply Works and Refuse Destructor	Corporation	Town Clerk, Darwen, Lancs	,, 26
Felling—Twelve Cottages, Coldwell-lane	Windy Nook Co-operative Society	H. Miller, A.M.I.C.E., Wesley-terrace, Felling	,, 27
Hawes—Residence		J. P. Kay, Architect, 34, Prudential-buildings, Leeds	,, 27
Talkin—Reading-Room		H. Scorer, Naworth Estate Office, Brampton	,, 28
Leeds—Seven Houses and Shops, Kirkstall-road, and Six Houses, Greenhow View	Benjamin Greaves	Thomas Winn, Architect, 92, Albion-street, Leeds	,, 30
Warrington—Green-House at Cemetery	Cemetery Committee	Thomas Longdin, Borough Surveyor, Town Hall, Warrington	,, 31
Alverstoke—Enlargement of Board-Room at Workhouse	Guardians	H. F. A. Smith, Architect, Star Chambers, Gosport	June 1
Guayaquil—Custom House	Government of Ecuador	Chief Ecuadorian Consulate, Liverpool	Aug. 31
Belem—Cattle Pens, Abattoir, and Two Markets	Municipal Authority	The Brazilian Legation, London	Oct. 24
Heywood—Tower at Phœnix Brewery, Green-lane		C. H. Openshaw, Architect, Derby Chambers, Fleet-st., Bury, Lancs	—
Ilkeston—House and Offices, Lord Haddon-road	Thos. White	W. Dymock Pratt, Architect, Cauldon-pl., Long-row, Nottingham	—
Haverthwaite—Parish Hall		Settle and Farmer, Architects, Ulverston	—
Harrogate—Stable	J. Barber, J. P.	H. E. and A. Bown, Architects, Harrogate	—
Govilon—Additions to Dwelling House, Routhouse Farm		E. A. Johnson, M.S.A., Architect, Abergavenny	—
Stevington—Infants' School	School Board	Usher and Anthony, Architects, 9, St. Paul's-square, Bedford	—
Harrogate—Additions to the West End Tavern, Otley-road		H. E. and A. Bown, Architects, Harrogate	—
Briercliffe—Re-erection of Craven Heifer Inn	Grimshaw, Ltd., Keirby Brewery	Charles Parsons, Architect, 9, Grimshaw-street, Burnley	—
Sherburn—Five Houses		P. Robinson, Architect, 72, Albion-street, Leeds	—
Derby—Premises, East-street	Midland Drapery Co.	Coulthurst and Booty, 4, Albert-street, Derby	—
Bramley—Eight Houses, Bell-lane		Fredk. W. Rhodes, Architect, Upper Wortley, Leeds	—
Corbridge-on-Tyne—Additions to Howden Dene	Joseph H. Straker	Joseph Oswald, F.R.I.B.A., Architect, 33, Mosley-street, Newcastle	—
Abergavenny—Eight Cottages, Laundry-place, Merthyr-road		E. A. Johnson, M.S.A., Architect, Abergavenny	—
Belfast—Four Semi-Detached Villas at Myrtlefield	F. W. Henby	W. J. Moore, Architect, Whitehall Buildings, Ann-street, Belfast	—
Bournemouth West—Nave and Aisles, Church of St. Ambrose		Boreham and Morton, Quantity Surveyors, Sunderland	—
Ipswich—New Lodge, Christchurch Park	Corporation	J. Shewell Corder, Architect, Wimborne House, Ipswich	—

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2263.
FRIDAY, MAY 20, 1898.

HURRY IN BUILDING.

THE natural process by which we prepare and assimilate the food necessary for our bodies may usefully suggest similar preparatory processes of building in what we may term "digesting" a design. As a matter of fact, the architect has very little time given him for preparing his materials. The client wants to build at once, as the season is advancing, or the business and trade must be carried on at a given time when customers return home. The consequence of this is, the architect has little time to collect his materials or digest them before building commences. The contract must be prepared immediately, and, therefore, the plans and specifications of the building have to be made forthwith. This haste in building is injurious in several ways. Let us briefly see what it means with regard to construction. A building, say, of a large commercial character has to be erected, in which all the latest improvements, such as fireproof floors, lifts, concrete in various forms, terracotta, faïence, &c., have to be introduced. To obtain in due course and order the supply of any of these materials or manufactured goods, they ought to be put in hand without delay. The architect has to first make his plans and submit them to his clients; he must then decide at once, before he can write his specifications, and give orders to the contractor or manufacturer to proceed with the work. The dimensions and sections of iron beams and floors, the large drawings for the terracotta work or the supply of stonework, ought to be immediately decided, arranged, or prepared, so that no delay in delivery of goods should occur. But is it possible for the architect to prepare his contract drawings, obtain tenders from quantities, and give instructions in so short a time? The essential orders which ought to be put in hand at once are delayed till the contractor commences his work, and then all is hurried. The architect cannot prepare his iron or terracotta himself at a moment's notice: he has to make calculations of weight and strength, to draw his sections, to make his large drawings for the manufacturer of terracotta. The only practical alternative is to leave all these matters to the contractor or manufacturer, and we know the result. Stock patterns and designs are employed—there is nothing special: all very disheartening to the architect, for his work is practically handed over to men whose interest is to economise—we will not say to shirk duty.

The personal attention of the architect to the selection of materials and modes of construction is very much less given now than formerly. The large contract competition between manufacturing firms has lessened materially his personal examination of details. Take, for example, those of ironwork and fireproof construction. The testing of iron and stone and concrete are matters in which he is little concerned. If he specifies that his columns or girders are to be able to bear safely a load of so many tons, or his cement is to resist a tensile force of 355lb. per square inch, that his concrete is to be mixed with 2 or 3 of sand and other materials, it is probable that he never has the opportunity of really witnessing the tests, or assuring himself of the results: they are left either to the clerk of works, if there is one, or, in most cases, the contractor undertakes the duty. And we know the consequences. Are not the disastrous failures of buildings, the sudden collapses of which we have had so many of late, owing to hurried and unexamined work?

But there is another kind of supervision in addition to that in selection and testing of materials which are supplied to the building. We mean the supervision of structures—the execution of the work on the building. We fear a good deal of this is neglected unless a clerk of works is employed, or perhaps the architect makes his visit at some time when the work has been completed or covered up. Perhaps piers of brickwork to carry a girder for a front are completed, and the iron girder is fixed. The architect has not seen the kind of bond used, the filling in of the core with inferior bricks, the foundation or the bearings; or it may be, as in the case of the unfortunate mansions at Westminster, a concrete floor or roof has been begun and finished, and the centring is "struck" before any inspection has been made as to the composition or quality, or setting of the concrete. Considerable progress may be made in a building in the course of a week or two, terracotta piers may be erected without the cavities being filled with concrete, and the weight thrown on the chambered blocks may cause fracture; iron columns may be put up and covered up with stone or granite casings before the architect sees them. If the contractor was bound under penalty to give notice to the architect whenever such work is in progress, or before it is completed, a great many building failures would be averted.

Hurry in building is the cause also of many disappointments in architectural design. It means haste in preparing working drawings, ill-studied details, bad proportions in some cases; there is no time for the elaboration of details, and they are left to take their chance. The contractor is thankful of course, as a rule, for he can give his own instructions, and between his not too critical eye, and the apathy of his workmen, the small eighth of-an inch scale drawing is interpreted to mean quite another thing than was intended. Imagine, if we can, what it means in the execution of a dormer, a gable, a cupola, a window, or some special feature of the design. The most artistic looking sketch or suggestion in the elevation may turn out, when too late, a veritable piece of ordinary "jerry" or Royal Engineers' building; what was intended to be chamfered or moulded is left plain, stone is taken for wood in mullions, "matched" deal boarding for structural timber or stone. In short, the ideas and aspirations of the architect in his design may be so completely disillusioned that he shrinks with horror from a building of much promise that has turned out so little to be proud of.

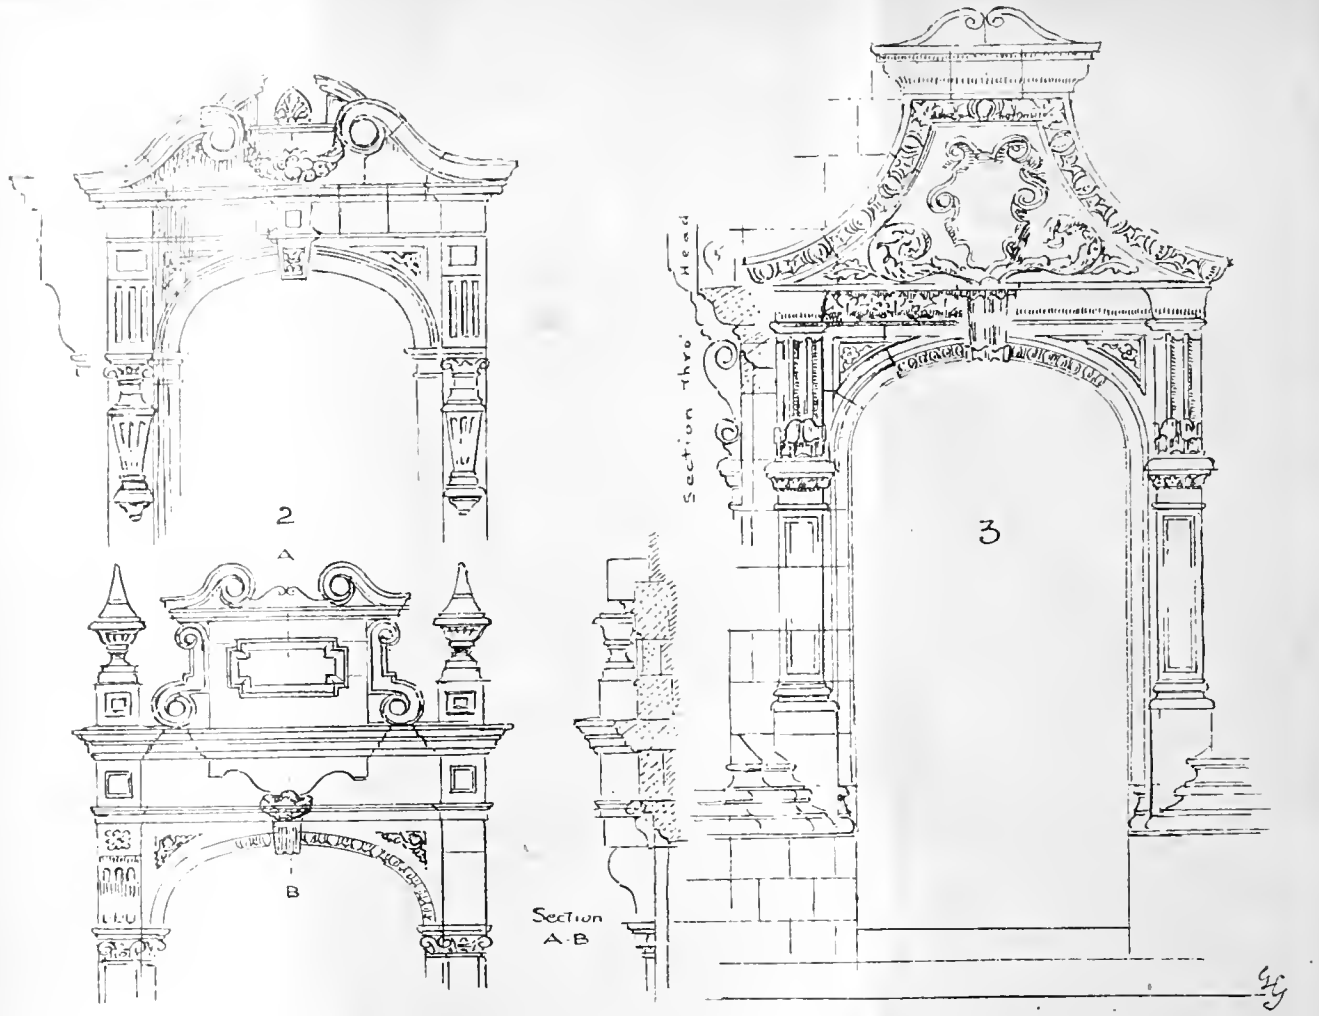
PICTURES AT THE ROYAL ACADEMY.

[FOURTH NOTICE.]

TWO very pleasing works in Gallery VIII. conceived in a decorative spirit are worth notice here before we pass on. One is Florence Small's picture, "A Dirge" (618), five young girls walking in procession singing a plaintive song. Their shadowed heads against the light background lends a poetical charm to the work. No. 629, "The Song of Ages," by Ethel Wright, is another charming composition—a group of sweet-faced maidens; the centre one, clad in embroidered cloak, is singing as she holds an illuminated scroll in her hands. At her side a maiden holds a lily, and the background is made up of white blossom of lilies. There is much delicacy of colour and refined devotional grace in the work. Above it Sigizmund Goetze's "Eloquent Silence," a long panel subject, with a recumbent figure of a man representing Death, with winged figures over the body, is bold and decorative, and is intended for the chancel of St. Botolph's Church, Aldersgate. William Stott's embodiment of Keats's "Ode to Autumn" is a poetical conception of autumn—a beautiful woman reclining in rich purple-coloured drapery amidst corn and other ripe fruit and grain. After this digression we resume the order of galleries.

The Ninth Gallery contains a few pictures of merit. Smaller in size, the work in this gallery is not less important. Carl Schloesser has a carefully painted piece of *genre*, "An Old Master" (666), a young lady standing by the side of an elderly professor—a very sympathetic rendering. As a marvel of finish, reflection on surfaces, and technical detail, Jessica Hayllar's work is always sure of a welcome. In this work, "A Perfect Angel" (683), the painter shows in the foreground a child with white wings, presumably the origin of the title; but the merit of the picture is in the drawing and perspective of the interior. The adjoining apartment is rendered with all the consummate art and subtle finish of this lady painter. The glazed prints or engravings hung on the wall, the reflected light, the piano, and accessories are executed with a remarkable technical finish and minuteness. Albert Goodwin's (690) "Haven under the Hill"; Bertram Priestman's "Grazing"; Andrew C. Gow's picture, "The Signal" (700); John Brett's delightfully-painted coast piece in North Cornwall, showing reefs of rocks at low water (715); Charles Kerr's "Ste. Jeanne d'Arc"; Dudley Hardy's subject, "The Widow"; Florence Small's charming study of a head on pale gold ground (755); and the dextrous figure-study, "The Relic," by Howard Pullar, are works we can only glance at. J. MacWhirter has a placid view of the "Lake of Geneva from Chexbres" (753), painted in his inimitable manner. There is also a characteristic portrait-study of Sir Edward Burne-Jones, Bart., in his studio-dress at work on a piece of wall decoration, by Philip Burne-Jones (790), and some works by Mark Senior (793), Walter Sickert (801), A. M. Rossi (839), Alfred Waterhouse's little landscape "Ashhampstead Common" (866), Flora M. Reid (860), Lexden L. Pocock (842), &c.

Herbert J. Draper's picture, "The Lament for Icarus" (903), is a masterly composition, almost Leightonesque in its modelling and method, full of harmonious colour. The sea nymphs are ministering to the drowned Icarus, the myth of which is that he took a winged flight from Crete to escape the anger of Minos; but the sun melted the wax which cemented his wings, and he fell into the sea and was drowned. The hapless youth is shown with these wings in the midst of the nymphs, who pity and support him. One of the important subject-pictures, painted with his usual scholarly and refined manner, is E. Blair Leighton's "A King and a Beggar Maid." The painter shows a handsome young king, clothed in the richest embroidered garments, offering his crown at the feet of a beautiful girl, who is standing before a canopied and richly-carpeted throne. In the distance are seen the attendants of the king. The subject is not so interesting as one or two other well-known subjects of this careful painter of historical episode; but the accessories, technical qualities, and colour are faultless, if too conventional. "Sisters" (916), by A. Chevalier Tayler, is in this master's best style. The scene laid before us is an elegantly furnished drawing-room filled with choice flowering shrubs, arum lilies and blossom. At a Louis Seize table, a young lady, pensive-looking and full of remembrances, sits watching her younger sister, who is in white dress and is receiving the attentions of a young man. The line of the poet, "A sorrow's crown of sorrow is remembering happier things" explains the painter's meaning. The drawing and arrangement of the figures are graceful and the

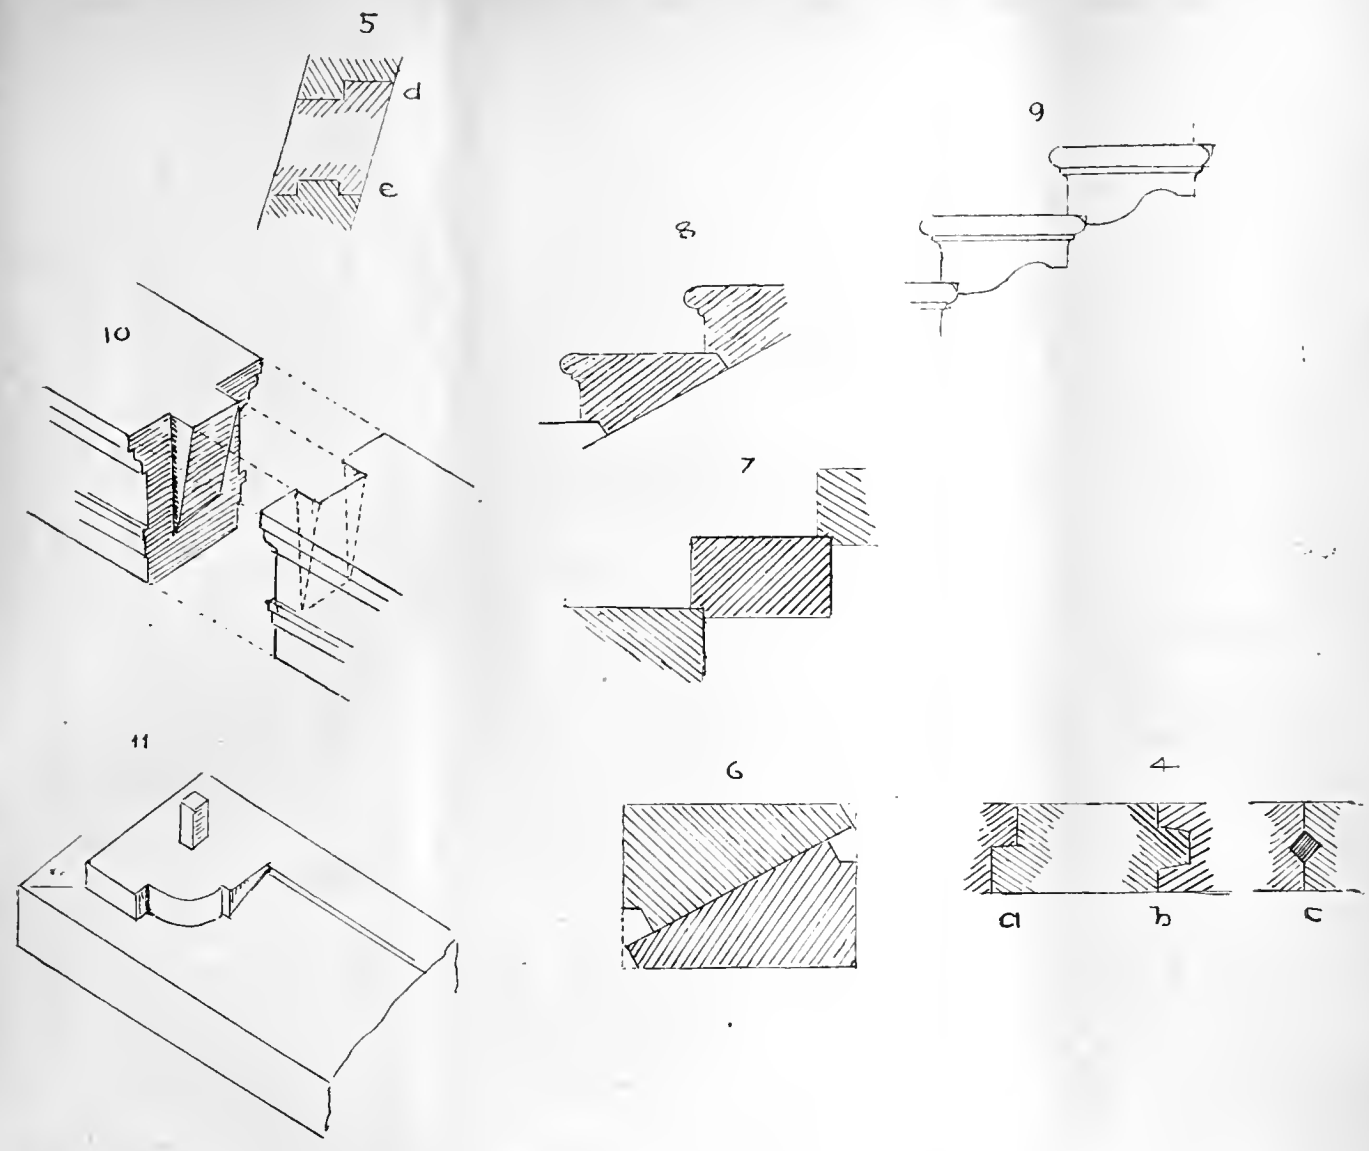


colour pleasing; and the painter has given us something more than a commonplace work of *genre*. Rowland Holyoake's "Fish-Washing on the Faröe Islands" (925), a number of fisherwomen washing the flat-fish, is admirable in colour and natural, one of the best studies of the kind.

A luminous and decorative subject is Charles F. M. Cleverly's "The Angel of the Grail" (918), with which we may compare "The Vision of the Sangreal," by Joseph W. Forster, in the same gallery (927), painted with a truly religious feeling. Then we have an imaginative symbolical subject by Albert Goodwin, entitled "Under the Roof of the World," a sublime medley of lofty mountains and peaks and edifices—a sort of dreamland or Arabian Nights vision painted with some power. H. H. La Thangue, whose work we have noticed in other galleries, has here another large realistic work, "A Sussex Cider Press," a man and woman turning the handle of a press, the gleam of warm sunset lighting up the toilers and the rich liquor which falls into the pail. There is light and shade, breadth and strong colour in this picture in country life. The man and woman are exerting their whole strength on the lever as the turbid stream issues forth. But why the great scale? The ruddy sunlight and the drawing of the figures are worthy of this new Associate's work; perhaps this is his best contribution.

Alfred East's large landscape, "Opulent Autumn" (930), is a grand study of evening sunlight as it bathes with its warm light the trees and river. The painter generally makes his lights subordinate in quantity to his shadows. We have here an autumn landscape in which the foliage is lighted on its near side, the shadows being comparatively few. Illumined foliage against a dark background is rare with painters, and when it is attempted the effect is often lost. Mr. East has preserved the breadth of his sunlight. In quite another tone is Yeend King's fine view of "Blackmore Vale" (898)—distant green meadows and trees and wooded banks sloping down to a glistening river which runs at the foot of the hill. The handling of foliage is delicate, and true to nature. The landscape of B. W. Leader in the next gallery, called "Surrey Sheep Pastures," is another of the beautiful series of landscapes which the new Royal Academician has given us this year. It has all the careful modelling and finished beauty of his other work. We see a real English or Surrey rough common or heath, in which a piece of placid water or pond occurs in the foreground. There is no golden sunset or tranquil evening effect; it is a sturdy and thorough English scene of a wild tract of country in hues dear to the admirer of our wild heaths. The ruts of a cart-road round the pond are filled with water which reflect the sky. Beyond, low distant hills bound the horizon. Thomas Somerscale's seascape, "A Coming Squall" (959), a deep blue sea with crested waves and a sailing ship reefing her sails, is a clever piece of sea-painting and reflection; and Harry Van der Weyden's "Passing Clouds" (966), a shelving beach of sand over which waves are breaking and spreading in limpid layers over the sand, is worth notice among many indifferent works. There is breadth, freshness, and atmosphere in J. Aumonier's picture, "A Wide Pasture" (960). One of the few pictures of merit is Claude Hayes' "Out in the Cold" (971), three old horses seeking shelter from the cold frosty air, near the fence of an outhouse by the wayside, on a cold, dreary winter night, the road covered with snow. There is a sense of forlornness and hard life in these three neglected horses, left after their labour, that appeals to the sympathy of the observer. The painter has awakened a chord of feeling. The conspicuous canvas of Eugène Burnand, "Group of Lansquenets—Swiss Soldiers of the 14th Century," has little of interest except as a *tour de force* of colour. The figures are in buff and red uniforms in a wide landscape.

"As Tall as Mother," by James Hayllar, is a domestic study. It represents a neat cottage interior lighted by a casement window. An aged pair—grandfather and mother—are at a small table, on the other side of which a young daughter stands, measuring herself against her mother, back to back. The soft evening light is cast upon the group. It is needless to say the work is executed with patient attention to details; that the expression and character of the grandparents and the younger members of the family are painted with great care. Hilda Montalda has a pleasing study, "On the Venetian Lagoons," full of sunlight, the dark sail against the luminous sky and the boat and its three occupants skilfully painted on the gleaming water. Frank Bramley's large picture of "A Dalesman's Clipping"—a Westmoreland scene of sheep-shearing—is bold and vigorously painted. We do not see much to remark in John H. F. Bacon's large interior subject. "The Ring" is rather a commonplace subject: a graceful young lady in a long white robe, or bride-elect, is standing looking at a ring near the window in an evening light, while the father and mother, seated by the fireside near a table lighted by a couple of lamps, are watching her with parental solicitude. The figures are gracefully drawn, and the waning, half-artificial light skilfully shown. "The Haven," by J. Langton Barnard (1002), is a pleasant restful coast view, with a gleam of sun on the steep white cliffs which rise up from the beach. Near it, J. Walter West's "Married for Love"—a young couple in a chaise descending a steep, hilly road—is painted in a rather flat style.



The sudden descent—does it presage misfortune in their married life? David Murray's large landscape, "Flowers of the Field," a field covered with scarlet poppies, is rich in colour and broadly treated. There are many other oil paintings of equal merit; but we have only attempted to notice leading pictures. The Water Colour and Black and White Room we must reserve for another article.

MODEL SPECIFICATIONS.—XIII.

MASON.

THE mason's work ought to receive particular attention. Every labour or detail that is not shown in the drawings ought to be described, as, for example, the description of each kind of stone, its quality, the quarry or any particular bed, how the stone is to be set, with what mortar, what joints are to be used, whether it is to be "tabled" or "joggled," or dowelled or cramped, how it is to be finished or dressed—whether pointed, hammer-dressed, axed, rubbed, dragged or scabbled? These terms ought to be properly applied, and each class of stone has its own modes of dressing. Thus grey granite, like many of the hard Cornish varieties of stone, is worked by splitting with wedges, and then scabbled by a hammer with a cutting face, then picked with a pointed hammer to give it a face. Picked work is better finished than scabbled work with a hammer. Portland or York stone is "rubbed," to form a fine face, with sand or gritstone; softer stones, like Bath, are "dragged." This labour is performed with the aid of a saw-like tool or comb which is traversed over the stone in all directions to remove the saw and chisel marks, and produce a smooth surface. In tooled work the chisel-marks cross the width of stone. A great deal of the best Mediæval work is finished with the chisel, or random tooled, or boasted by the chisel in the harder varieties. Many stones defy small-tooth-comb work or dragging. In old buildings the moulded work often shows that the masons followed the lines of mouldings, or chiselled them as a wood-carver would—never across. Mr. Neale describes the stonework at St. Alban's Abbey as finished by the axe by the Normans, chiselled during the Transition Period, "bolster-tooled" during the Early English, claw-tooled during the Decorated, in which last-named period the mouldings were scraped. Generally for hard stone finish the labour may be described as "boasted," or tooling at an angle, or "tooled," and for soft stones "dragged" or "combed." There are also "pointed" work for bed and side joints to produce approximately true surfaces, executed by a pointed tool or punch, and often used for quoins and plinths to produce a rough face with a chisel draught round the edges; vermiculated work used in quoins; "broached" done by a chisel or punch, "droved," &c., all of which terms should be carefully applied. We shall give examples of these. As to the qualities of stone we refer the reader to the several textbooks, chiefly "Notes on Building Materials." In specifying Portland stone care must be taken to name the particular bed. The most valuable are Whitbed and Basebed, as they are even in texture and durable, but for hardness and durability Whitbed is preferred, as the Roach kinds are full of shells. Perhaps even greater care is necessary in specifying Bath stone, as many of the kinds in the market weather badly in towns and seaside places. For ashlar work and carving, Box Ground, Corsham, and Combe Down varieties are used; the yellow Mansfield, a magnesian limestone, is also even-grained, suitable for carving. Other useful limestones are the Ancaster, Ham Hill, and Bolsover. Stone should also be specified to lie in its natural or quarry bed. The average beds or depths of stones should also be specified, and the kind of mortar and pointing.

In ashlar facing, the stones will vary in size from 12in. in height and 8in. or 9in. in thickness, and of lengths from 18in. to 30in. When the ashlar is of the same thickness, the backs of the stones are often inclined to the face, to give a bond or lap; but this plan, as it leaves vacuities, is objectionable. In some parts of the country where stone is cheap, a rubble backing is used; but unless the rubble is composed of large stones and few mortar joints, the wall is liable to bulge outwards, owing to the settlement or shrinkage of the backing. In Scotland and the North, we find this rubble backing; but great care is used to prevent settlement by careful bonding or "through"-stones, and the ashlar facings are excellent in quality. These bond or "through"-stones ought to be put in alternately, the "through"-stone of every succeeding course being placed between the two below. In London and the South, brick backing is generally used; but the same care as to mortar joints and bond are

necessary to be observed. As to how many courses of bricks the stone courses are to be cut, opinions differ. Sometimes six courses of brickwork is specified; in all cases the ashlar should be equal to a given number of brick courses, so that the bond may be made easy, and separation of the face and backing prevented. With rubble backing it is necessary to avoid any great difference of height between the ashlar and rubble. Thick and numerous rubble joints are sure to lead to bulging and separation of the face, even if "headers" or "through"-stones are used. The ashlar should have level beds, and the vertical joints should be carefully dressed true and square for some distance from the face at least; but the tail ends of the ashlar may be irregular, and sufficient headers used to bond well with the rubble. The ashlar should have a depth of bed equal at least to its height, so that a course of stones 12in. high should go through the wall that distance; but this rule is not often observed, and facings of 4in. or 6in. thick are often used. A wall of this kind is weak and apt to bulge. Walls of this composite kind should be thicker than those built of brick or squared stone throughout.

There are many joints used in masonry. We illustrate a few of them. Fig. 4 shows three methods of joining stone used in landings, &c. The second, *b*, is a joggle-joint, already explained, and which is often used in terracotta. The tongue is cut slightly tapering; it fits into a corresponding groove worked on the other edge, and is run in with cement. It forms a strong joint for landings. A rebated joint, *a*, is also frequently used for copings and landings, and is used as a bed-joint in stone spires (see Fig. 5). Another common mode of jointing is shown at *c*. Two grooves are cut on the opposite edges of the stone, and the cavities are run with lead or cement. Slate dowels are sometimes inserted, run with cement. In Fig. 5 we give two similar kinds of joint, as at *a* and *b*, used for the stones of spires or cupolas. The first is a rebated or stepped joint, and the second a joggled or tabled joint. In cutting stone steps, it is usual to cut two steps out of one stone (see Fig. 6), a plan which saves material and insures accuracy. Figs. 7, 8, 9, and 10 illustrate the jointing of plain and spandrel stone steps. The sketches 1, 2, 3 show three other examples of decorative terracotta door-heads. The last represents one of the doorways in the Birmingham Law Courts. For ordinary buildings the clauses may run as follows:—

1. *Generally.*—The whole of the stone to be of the best quality of its respective kind, and be approved by the architect, free from vents, sand-holes, and other defects, and to be laid on its natural bed. The Portland stone to be "Whit-bed" of the Portland quarries. Or, if Bath, to be from the Box Ground, Corn Grit, or other approved quarries. Or—

The stone for external purposes to be of the best quality Portland (or of a superior description of "Whit-bed" stone from ——— quarry), free from veins, vents, shakes, and other defects, laid on its natural bed in fine mortar, finished with a "rubbed" face, and cleaned down at completion and left perfect. Or—

The stone to be of the best Bath stone from the Bath Stone Firms, Ltd., or from Box Ground, or Combe Down quarries, laid on its natural bed, and cleaned off. The plinths, bases of columns, sills, to be of the former (or to be from the Darley Dale and District Stone Co., or W. H. and J. Slater's quarries, Derby), and to be bedded and jointed in fine mortar, and finished with a dragged face.

Every stone to hold its full length and height square to the back.

The following are samples of clauses for plain ashlar work:—

2. *Ashlar.*—The external walls or front of building to be faced with Portland (or Corsehill stone) ashlaring, in courses 12in. high, 6in. (or 9in.) on bed, finished with a fine rubbed face, laid in lime mortar, bonded to brickwork every 3ft. (or 5ft. apart) on each course; the bonding stones to be at least 2ft. superficial in face, and to go through the wall. The joints to be not more than $\frac{1}{10}$in. (or $\frac{1}{8}$in.) thick, and bedded $\frac{3}{4}$in. from face in lime putty. Or—

The ashlaring to be in courses of varying height to suit the brick backing, the stretchers to be 4in. (or 6in.) deep, and the headers 9in., one header to every stretcher, and all the joints to overlap. The faces to be rubbed, and the ashlar to be laid in best lime and sharp sand mortar, and to be well grouted at every course. If cramped, gunmetal cramps to be used, run with lead. Or—

Face the external or front wall with Bath stone coursed ashlar from Corsham Down (or Combe Down quarries) in courses 12in. high, and averaging 6in. (or 9in. on bed), finished with a finely-dragged face, with a "through"-stone every yard superficial, or every 3ft. apart in each course. The joints to be not more than $\frac{1}{8}$in. thick, and bedded $\frac{3}{4}$in. from face in lime putty, neatly pointed and cleaned down at completion. Or—

The walls (or front) to be faced with Bath stone in random courses varying in height from 4in. to 14in., and from 4in. to 8in. on bed, in lime mortar, bonded every yard superficial with a stone 2ft. superficial right through the wall. The ashlar to have finely-dragged face. Or—

The ashlar work to be of the best Portland, laid in courses of 15in. high and 12in. in thickness, with beds and joints, hammer-dressed, and squared to accurate planes with one header to every stretcher.

No pinning, wedging, or filling-in will be allowed. The whole to be set in the best lime and clean sand putty, and neatly pointed as the work proceeds. The joints not to exceed $\frac{1}{8}$in. thick.

3. *Labours, &c.*—Perform all mitres, stopped ends, splays, rebates, grooves, chases, sunk, weathered, and throated work, and provide and fix the necessary copper or gunmetal cramps and dowels. No iron cramps or dowels to be used.

Mr. Leaning gives the following useful clause for quarry-worked stone:—

4. *Quarry-Worked Stone.*—"The quality of stone shall be equal to a sample deposited with the architect. The stones shall be fitted together ready for setting, and shall include all necessary joggles and holes for dowels. The stone shall be marked with numbers for identification, shall be accompanied by a key-plan, and shall be packed and delivered at the works at convenient times: all the stone required below level of ground-floor (here fix date), all the stone required between ground and first floor before ———, &c. (If the contract is made with stone merchant, add)—The stone merchant shall be responsible for and make good any damage in transit."

5.—*Plinth.*—The plinth stones of Portland "whit-bed" to bed the whole thickness of wall, 18in. (or 2ft. high), and 9in. on bed, with bonder stones every 5ft. apart, and to project 3in. (or more) from face of wall (see detail). Or—

Put all round the building a Portland stone rubbed plinth 2ft. high and 8in. bed, plugged with lead. Or—

Put round building an Aberdeen granite plinth 2ft. (or 2ft. 6in.) high the whole thickness of wall, with chamfered or ogee base-moulding, projecting 3in. from face of wall, tooled or hammer-dressed, and plugged with lead.

6. *Quoins.*—The quoins to angles of building or front to be alternately 15in. and 9in. on face, and 12in. (or 15in.) high, with moulded or chamfered edges (see detail). Or—

The quoins to be plain raised blocks, with square channel joints, worked below the top bed. (In Gothic work the quoins are of random sizes and heights, and these several kinds should be specified, and the dimensions given).

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fourteenth ordinary meeting for the present session of the Institute was held on Monday evening. In the absence of the President, Professor Aitchison, R.A., due to a severe attack of gout, Mr. H. Louis Florence, vice-president, took the chair. There was a large attendance of members and visitors, tho latter including Mr. Jan Stwyt, of Amsterdam, who was cordially welcomed by the chairman. Among the list read of nominations for membership, the name of Sir E. J. Poynter, P.R.A., proposed for election as an Hon. Associate, evoked a round of applause.

THE LIBRARIES OF THE MIDDLE AGES.

A paper on this subject was read by Mr. T. G. Jackson, R.A. The lecture was illustrated by examples of actual Mediæval ironwork and volumes and numerous lantern-views, giving exterior and interior views and details of various buildings described. In his opening remarks, the author contrasted the modern free library, equipped for the convenience of readers, with the libraries of the Early Middle Ages, pointing out that in Early Mediæval days, with books so rare and precious that the greatest care was necessary in their storage, the only large collections must have been those in the cloisters of the religious houses or collegiate churches. The earliest went back to the time of St. Benedict, in the 6th century; though there was one at Jerusalem in the 3rd century, and the church at Hippo inherited the books of St. Augustine, in the days when the great Roman libraries were still in existence. It was on the model of the old classical libraries that those of the churches and convents were framed. Of the two kinds of private libraries among the Romans—the simple and the luxurious, which were both described—the simpler plan was adopted by the churches and convents as more fitly serving their needs, the books, for the most part, being kept in chests or locked up in presses. As the collections increased, the books were divided into two classes: one being kept as a reference library, and placed in presses in the cloister where students could come and consult them, and the other consisting of volumes which were lent out to the monks to read. In this connection the lecturer quoted a curious rule made by Archbishop Lanfranc in 1080 for the English Benedictines, who were allowed to borrow and exchange one volume per annum. As collections increased, accommodation had to be made for them. At Christ Church, Canterbury, in the 14th century, the books, which had increased to 698, were dispersed in cases throughout the convent wherever space could be found. The inconvenience of this to students requiring to refer from volume to volume led to the provision of a room devoted to books, and with conveniences for studying them. Between 1414 and 1443 a library was built over the Prior's Chapel at Canterbury by Archbishop Chichele, and another at Durham, over the old sacristy, by Prior Assington; in the abbeys of Citeaux and Clairvaux similar provision was made over the scriptorium between 1480 and 1503; at Saint-Victor, at Paris, between 1501 and 1508; and at Saint-Germain-des-Prés, about 1513, over the south cloister. Buildings specially to hold their libraries, and to afford easy mode of consulting their contents, were first erected by the universities and colleges. The

OLDEST STRUCTURE OF THE KIND IN ENGLAND,

perhaps in Europe, is the old library of the University of Oxford, which still retains many features of its original form. This structure, rarely seen by visitors, and even unknown to the majority of Oxford men, is a two-storied building situate on the north side of the choir of St. Mary's Church, adjoining the tower at one end, and separated from the body of the church by a narrow courtyard. Having glanced at the way books were kept, used, and lent at Oxford prior to the erection of this building, the most interesting edifice in the university, the lecturer gave a sketch of its foundation by Thomas de Cobham, Bishop of Worcester, about 1320, and some incidents in its early history, following with a description of the interior, furniture, and general arrangements. Long desks were placed at regular intervals at right angles to the walls on which the volumes lay on their sides. A bench was fixed in front for the reader, and a window came between each pair of desks to light that pew or cell. Every volume had a metal slip riveted to the front edge of the board forming one cover, to which was attached a light iron chain of the requisite length, having at the other end a ring. This ring ran up an iron rod which was carried along the top of the desk, and was secured at the end by a hasp and padlock to prevent the ring being drawn off. The foundation of Bishop Cobham's library was succeeded shortly afterwards by that of the

LIBRARY OF DURHAM COLLEGE, OXFORD,

by Richard de Bury, Bishop of Durham (1335-45), a bibliomaniac, traveller and scholar, and withal a humorous writer. The books bequeathed by De Bury to the college were kept for many years in chests under the custody of scholars deputed for the purpose. At the beginning of the 15th century a library was built, and regularly furnished with book-cases or settles inclosing pews or studies between them, where the books were chained. When Durham College came to

an end at the Dissolution, its old buildings were utilised by its successor, the present Trinity, and the old Library of Durham College still serves as the Library of Trinity College. William of Wykeham's New College at Oxford set the fashion for all future collegiate buildings at either University in provision being made for every department, and thenceforward every college had its library as an essential part of its plan. Though books were few, the rooms devoted to them had to be very large, the chaining of the books to the desks making it possible to have only very few on each desk. Soon, as books increased, shelves were formed behind the desks, tier by tier, until at last, in the 17th or 18th century, they reached the ceiling. The appearance of the fittings before that time can be well seen in the old library of Merton College, Oxford. Of chained libraries, which the lecturer treated at some length, there are at least three extant in England, that belonging to Hereford Cathedral being the most ancient and perfect. Old chains, hasps, and staples belonging to Hereford—specimens of the actual fittings of a

MEDIÆVAL CHAINED LIBRARY,

were exhibited by Mr. Jackson, and the method of fixation explained. All Saints' Church, Hereford, and Wimborne Minster also possess chained libraries, the former founded at so late a date as 1715. But the finest in the world is that of San Lorenzo, Florence, the great hall of which was designed by Michel Angelo in 1524, to contain the collection formed by several generations of the Medici. The lecturer then touched on the difficulties of consulting books in the old chained libraries. Shelves for the ever-increasing number of books had been provided, but desk accommodation remained as before. One student occupied on a volume prevented three or four others getting access to the books. This led to the library-rooms being enlarged. Interesting reference was made by the lecturer to Duke Humphrey's connection with Oxford, and to his splendid benefaction of over 600 books to its library in the earlier half of the fifteenth century. The new acquisitions made more commodious quarters imperative, and in 1444 the University resolved to build an upper story to the new Divinity School, which, begun in 1426, was being slowly carried towards completion. The change was at length made in 1480, when the University Library was removed from the old solar or upper chamber at St. Mary's to the new solar over the Divinity School. The lecturer then glanced at the subsequent fortunes of the Library, which was despoiled of the most valued of its treasures by the Commissioners of Edward VI., and munificently enriched, altered, and enlarged by its second founder, Sir Thomas Bodley, at the end of the 16th century, since whose day the venerable central room has remained practically unaltered—the most attractive spot to the student to be found anywhere. Chains were bought for the Bodleian Library as late as 1751; it was not till 1757 that this method of securing the books was abolished. Other libraries described more or less fully were that of St. John's College, Cambridge; the new library finished by Sir Christopher Wren in 1695, which forms the western side of Nevill's Court at Trinity College, Cambridge—a stately building, both within and without, a triumph of architecture, which would suffice by itself to establish Wren's reputation as an artist; and the fine building of the Radcliffe Library, completed by James Gibbs in 1747. In conclusion, Mr. Jackson showed views of a library of his own planning at Uppingham School, in which he had tried to combine the two arrangements of cases against the walls and cases breaking out from them.

Mr. J. W. Willis Clark, M.A., in opening the discussion, said it was to the rules of the Benedictine order that we were indebted for our modern public free libraries. A library did not, it was true, form any part of the original plan of a monastery; but it was found as books increased in numbers that they could not all be kept in the armoire in the cloister, and a special room was accordingly set apart for them. This was the history of the libraries at Durham, at Citeaux, and elsewhere, and thus the monastic collections of books were prototypes of our leading libraries. The monastic buildings were always long narrow rooms, with windows equally spaced in the walls, and between these windows, as Mr. Jackson had shown, the books were arranged. Although the original collectors of books had all been dispersed from the catalogues and descriptions which had come down to us from those at Clairvaux and elsewhere, we could make out to a certain extent what the bookcases were like, and knew that in many cases there were two shelves placed back to back, the set of four forming a "bank," and that desks were provided for readers. He had never yet been able to discover any remaining examples of a book-press or desk, although he had travelled all over the greater part of Europe searching for them, and he feared it was almost impossible to hope to find one preserved. There were plenty of traces of the great care taken by the monks of their manuscripts; indeed, the writings generally ended with an injunction to take care of them or a curse would be pronounced. It was evident that the monks did not mind lending their treasures provided proper pledges were given that they would be returned in good condition, and it was this custom which provided us with the first public libraries. At Assissi the monastery had a distinct lending library of no fewer than three hundred volumes. During the French Revolution the inhabitants of the towns recognised the value of their great libraries and took care of them. We could find out with tolerable exactness how our Mediæval libraries were fitted up by studying the University records and remains, especially those of Oxford, which seat of learning was always richer than its sister at Cambridge, for it would be incredible that the monasteries should not have copied the university fittings as they did their statutes. It was clear that the modern bookcase was evolved from the monastic one. It should be remembered that Sir Christopher Wren first provided and fitted up a library at Lincoln Cathedral, where he arranged the bookcases against the wall and not at right angles to it. Wren probably derived his idea from the famous library founded by Cardinal Mazarin in Paris in the building now replaced by the Palais de Institut on the left bank of the Seine, for we knew Wren studied in this library a good deal. Mazario, in turn, was indebted to the library of the King of Spain at the Escurial; the latter famous Royal library, in truth, made a great stir, and its arrangement was widely copied. At Lincoln, there were four splendid double-desks, with great poppy-head ends, belonging to Wren's library in one of the cloisters. There was a very similar library at Wells Cathedral over part of the cloisters, which was refitted by Dean Bathurst of Oxford; it had been said to be a late survival of a chained library; but there was no trace of chaining on any fitting or book, nor were there any payments in the records for chaining.

Mr. H. W. Brewer said he came across the will of John Carpenter, the founder of the City of London School, who left an exceedingly good library for his times. He bequeathed the bulk of the books to Sir Richard Whittington, and stipulated that they should be chained, but so kept as to be accessible to all poor scholars of the city of London who wished to consult them. He further bequeathed to his relative, John Carpenter (afterwards Bishop of Exeter), "that book of architecture given to me by William Clee," who had been controller and master of works to Henry V. and Henry VI., and who built the fine hall or palace at Eltham, and carried out various works at the Tower of London and the Sheen Palace. This William Clee, the architectural author, had stipulated, in a curious letter still in existence, and addressed to the Privy Council of Henry VI., that £1,000 should be provided for him at Eltham, remarking that for building the kitchen at the Tower of London he did not receive so much as forty pence. It would be interesting to know what became of these books of John Carpenter, and he for one should be glad to see some of them find their way into the Institute library.

Mr. H. H. Statham proposed a vote of thanks to Mr. Jackson, remarking that it had been one of the most delightful papers they had had for a long time, and one which traced the history and development of libraries in their practical arrangement. The exhibition that evening of the actual chains and fittings from Hereford Cathedral give an air of realism to the lecture, which brought them into touch with Mediæval readers.

Professor G. Baldwin Baldwin, of Edinburgh University, seconded the vote of thanks, remarking on the exceptional interest of the paper, which, he said, was quite in accordance with the best traditions of the Institute. They owed a great debt to the monastic library, for by its agency not only the sacred, but also the profane treasures of literature had been preserved to us, since we find by its catalogue that the library of the monastery of St. Gall contained profane as well as sacred books. A plan of a monastery made in the early part of the ninth century showed a building used as a scriptorium below and a library above, a window being arranged between every pair of desks.

Mr. E. W. Hudson observed that an important library had not been mentioned—that which was founded in Paris by Saint Louis on his return from the East, was attached to the north side of La Sainte Chapelle, and was designed by the same architect, Pierre de Montreuil. He should like to ask if anything was known of its form and arrangement; it seemed to have had an apsidal east end, and to have been three stories in height, the basement being used as a sacristy, the middle floor as a chapel, and the upper room as a storehouse for books. The well-known library at the Conservatoire des Arts et Metiers was an apartment designed by the same architect, but was the refectory of the Benedictine monastery of St. Martin des Champs; the magnificent hall utterly refuted the libel that buildings in the Gothic style were necessarily defectively lighted.

Mr. W. H. St. John Hope observed that if architects and students would keep their eyes open when visiting Benedictine and Cistercian buildings, they would find in many cases abundant traces of the provision for reading and lending books, often in quiet recesses in the east walls of the cloisters. In some cases there were two such libraries, one a small one for novices, and a larger one, but still only 5ft. or 6ft. square, for brethren. There was such a library at Kirkstall, another at Worcester, and a similar one formerly existed at Meux Abbey, now entirely destroyed, of which the inventory was extant. At Furness a large cupboard existed in precisely the same position as at Kirkstall, and at Castle Acre and at Fountains there were traces of an upper story approached by a wide and ample staircase. We obtained glimpses of these libraries from inventories such as at Titchfield, Hants, and he had a list drawn up by a monk at Canterbury, showing the books which needed chaining and those which needed repairs, and from this Mr. Willis Clark was able to reconstruct the library and its books.

Mr. Willis Clark added that an ancient library had lately been destroyed in Paris to make way for the Ecole Polytechnique. Near the well-known Bibliothèque de St. Geneviève, in Paris, there was till recently an old library, cruciform on plan, which had been turned into a dormitory for boys. He feared that all the conventual libraries of Paris had now disappeared.

The vote of thanks having been passed by acclamation, Mr. Jackson briefly replied, remarking that catalogues of old libraries always possessed a great interest. There was one of Oriel College, Oxford, which Dibden described as a roll; but it still existed as a bound book, and in it, owing possibly to the frequent loss of illuminated title pages, all the volumes were referred to by the first word on the second page. [Mr. Willis Clark: That is the uniform custom.] As an architect, he was naturally jealous of the reputation for originality of Wren, and he could not allow that Wren was indebted either to Cardinal Mazarin or the architect of the Escurial for his treatment of Trinity College, Cambridge. The lower part of the wall had to be left unpierced by the architectural requirements, and it doubtless occurred to Wren that it would be a good opportunity to line the blank wall up to the window level with bookcases.

THE SURVEYORS' INSTITUTION.

At the ordinary general meeting of the above society, held on Monday evening last, a paper was read by Mr. Herbert Trustram Eve, on the subject of compensation values, as between incoming and outgoing tenants of agricultural holdings, for unexhausted improvements. The subject is one which bears but little on the branch of the surveyor's profession, with which our readers are chiefly connected; but the paper contained an interesting series of tables which, when embodied in the *Transactions* of the Surveyors' Institution, cannot fail to be a valuable guide to those who have to do with the valuations of agricultural property, which under some recent Acts may include buildings. The author avowedly approached the subject from the point of view of a surveyor, and not

from that of an agricultural chemist, and based his arguments mainly on a recent article by Sir J. B. Lawes and Sir J. H. Gilbert. He gave the usual methods of ascertaining compensation, founded on the cost of the food consumed upon the farm, and presumably remunerative to the incoming tenant in the shape of manurial value, and advocated a system by which these values should be founded on the varying prices of the three principal cereal crops, as was done in the calculation of the value of the tithe-rent charge under the Commutation Act of 1836. This was a practical basis which could be understood by a farmer, who could not be expected to follow the ever-varying market values of chemicals, such as ammonia, phosphoric acid, and potash, which formed the basis on which the chemical valuation must be made. A combination of the two methods of calculating the value of additions to the fertility of a farm, for which the incoming tenant could reasonably expect to be made to pay, and for which the outgoing tenant might well claim compensation, was advocated by the author. Many instances were given of differences in the value of feeding stuffs, varying with the quality of the land, the sort of stock fed, the number of years of "continuous good farming," and other conditions, and, on the whole, the paper seemed to be one which would be most useful for reference to the land-agent surveyors.

A discussion followed, in which Mr. F. J. Smith, Mr. G. D. E. Wigley, Mr. E. A. Rawlence, Mr. F. J. Brown, Mr. T. A. Dickson, Professor E. Kinch, and Mr. J. Looker took part, and the further consideration of Mr. Eve's paper was adjourned to the next session of the institution.

"BUILDING NEWS" DESIGNING CLUB.

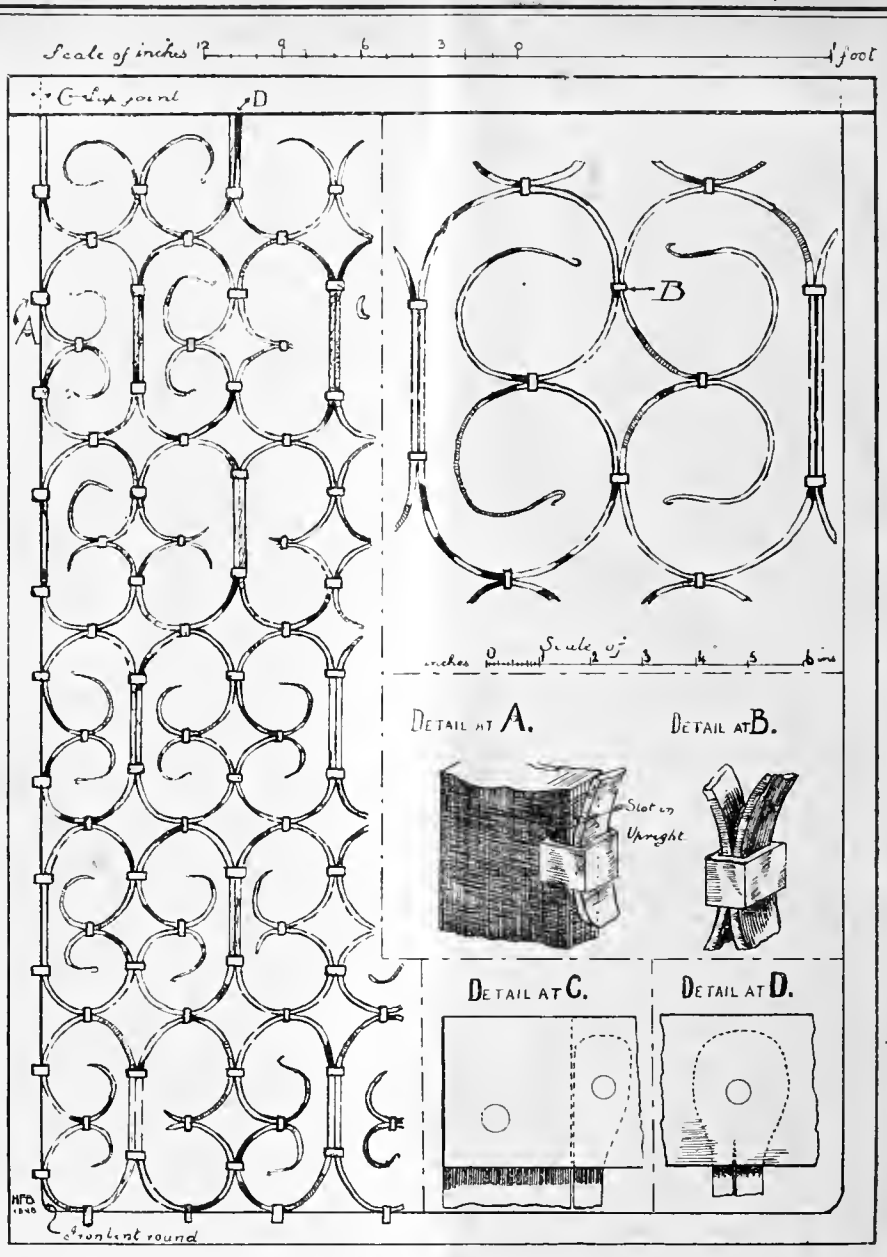
A HILL-SIDE BUNGALOW.

A RESIDENCE such as the following particulars provide for presents a decidedly attractive subject for the display of taste and ingenuity: the restrictions are few, and the chances for artistic originality are unfettered, provided all attempt at a monumental style of building is avoided, and the suitability of simplicity is acknowledged. How far the competitors have succeeded may be judged by the plans which we herewith publish, and in considering these designs it is desirable that the conditions issued for the guidance of the competitors should be kept in view:—

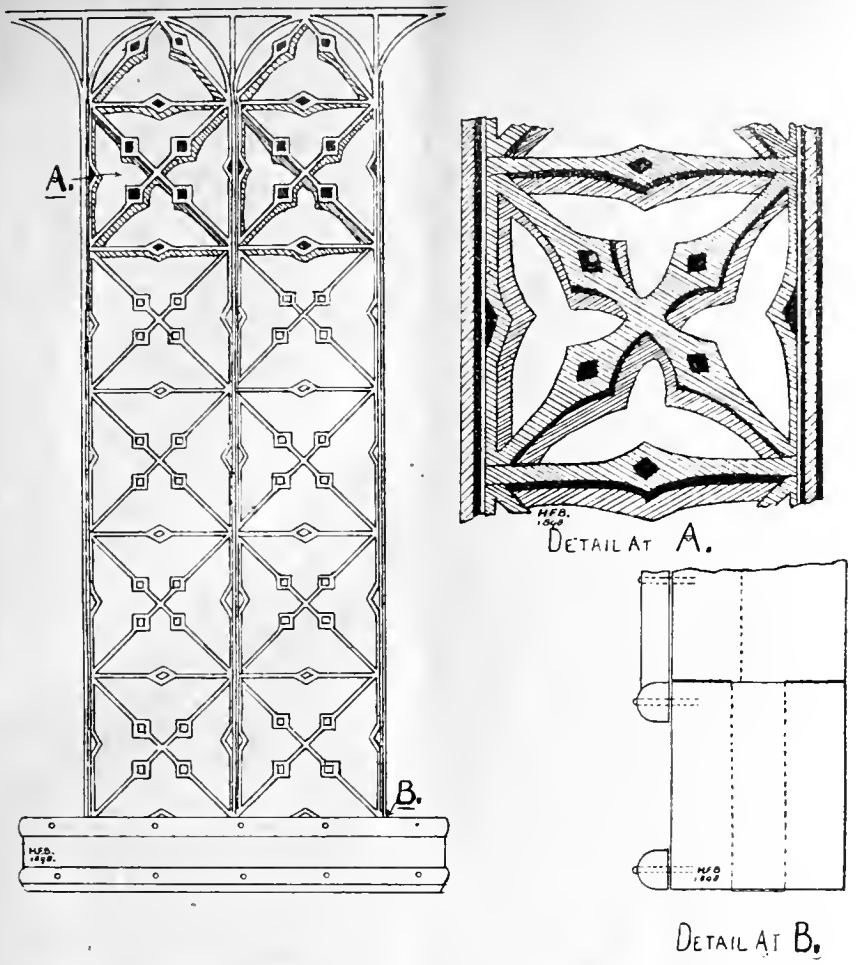
"A Bungalow for a Gentleman. The site for this small residence is on the side of a well-wooded hill a few miles from London, and the building is intended for summer occupation. The incline from east to west is 1ft. in 10ft., and the prospect, of course, is over the valley below. The approach is from the north. The base of the building is to be in red brick. The whole of the accommodation is to be on the ground floor, excepting a belvedere smoking-room, which is to be located over the central hall, out of which the reception and best bedrooms are to be approached. This hall is not to be treated as a sitting-room. The building must be compactly contrived in a simple and suitable way, remembering that a bungalow is not a baronial hall. The living-room is to be 24ft. long by about 18ft. wide. The drawing-room 16ft. by 13ft., or of that area. A billiard-room for a full-sized table. Four best bedrooms, and two more for female servants. A man's room is to be provided, and to be suitably isolated. A bathroom, lavatory and cloakroom, &c., and a box-room to be provided, and space for bicycles, golfing-irons, &c., is to be accommodated. There should be a small cellar, and the fall of the ground may suggest a half-basement; but the scheme is left to the competitors. Along the garden side of the house on the west front a terrace 12ft. wide is to be planned. The kitchen and offices to be appropriate for such a dwelling. Materials, brick and rough-cast. Tiled roofs. Scale, 8ft. to the inch. Style, suitability. Plans, two elevations, section, and view. If really necessary to work the drawings nicely into one sheet, the scale of plans may be 16ft. to the inch."

The designs chosen for the three first places are "Centaur," "Pantile," and "Hotspur," in this order of merit. The first design, essentially a bungalow, has an air of compactness about it, making for facility of simple roofing, and the belvedere balcony flat is a distinct advantage. The skylight trunk for the hall and belvedere stairway is a contrivance possibly necessitated by the central-hall arrangement, which we are aware we asked for. There are objections, of course, to skylights of this kind, and "Centaur" has more than one of them, still, beyond a passing comment noting the contrivance, it appears hardly incumbent to say more on the point. One advantage of "Centaur's" plan is the manner in which the bedrooms and the servants' department are divided off from the living-rooms, and these latter are convenient and well placed. The plans show how the arrangement is managed. Of the exterior there is not much to say. The effect would have been improved if rather more had been made of the upper part of the bay to the dining-room, and the main entrance would have been all the better for a little more distinction. "Pantile" makes his bungalow on the "verandah" side too much like a village school, and the so-called "verandah" is really only a terrace. The plan is rather good, and is fairly well lighted. We do not quite like the dining-room service coming immediately past the front door, and an external door to the bicycle-house would have been an improvement. The drawing-room is not happily managed. The arched window to the dining room seems more suitable for a billiard-room, whereas the long low window to the billiard-room without the top-light would be inadequate. "Hotspur," the third design, is not economical, and his plan is scarcely a bungalow with its vestibule, lobbies, and corridors. Externally, the building is overweighted by the wasteful roof, though there is a degree of cleverness about the proposal which we have acknowledged. The w.c., provided in conjunction with the bedrooms, should be entirely isolated from the billiard-room. In several details the plan is open to improvement. "Cædmon" has an ingenious plan, with the central hall placed diagonally in respect to the reception-rooms, the bedrooms forming a wing to the right of the entrance, and the kitchen and servants' room running to the left. Had the author worked out his scheme more carefully, and with a little more taste, he would have been awarded a higher place, for the general idea of the plan is a good one. Unfortunately, the passages are dark, and the design fails in detail, while in general effect the building is not a success.

"M'Gilligan" strives to be original and impart a freshness to his building. A symmetrical contrivance of circular bays to the dining-room and billiard-room on either side of the drawing-room on the garden front has seemingly governed the general arrangement of his scheme much too seriously, the smoking-room belvedere rising in between. The design is too cut-up, and although "M'Gilligan" has drawn it out carefully enough, his plan required a little more thought. For example, the verandah door from the dining-room looks directly into the best bedroom window. The hall would be very dark, and the wide passage opening out of it is very wasteful. "Petticoats" comes next with a better plan than elevation. The circular turrets would have been better omitted. The loss of space in passageways is a serious matter. There was no occasion to give the man's room a separate bath-room, w.c., and larder, and it is not a nice plan to locate the maidservants' bedrooms in the basement. "Umbopa" is not a good planner, dovetailing a bedroom in between the billiard-room and



IRON GRILLE IN ST. ANSELM'S CHAPEL, CANTERBURY CATHEDRAL.



IRON GRILLE IN HENRY V. CHANTRY, WESTMINSTER ABBEY.

the drawing-room and locating another bed-chamber close to the front door. We have little to say in praise of this design, which in many respects is childish, but externally it exhibits some taste. The author would do well to cultivate this and learn to make a plan. "Zeo" is too dashing by half. His façade might be mistaken for a convalescent hospital, and his plan is made to fit the elevations regardless of convenience and comfort. The servants' bedrooms adjoin the billiard-room door, and close at hand is the bath-room, the chief bedchambers opening into the central hall. "Zeo" cannot expect to succeed if he mixes up his plan in this way. His chief idea seems to have been concentrated on the production of a very black-and-white perspective. For that much we place him here. "Microbe" sends a curious-looking building, mainly in timber, oddly schemed. The billiard-room is in the basement, and is very badly lighted. The kitchen and bedroom departments have the merit of being shut off from the rest of the house. A strange central tower serves as a belvedere. "Gib" is far neater, and in some ways far more successful. His plan is rather a good one; but in type the building is not a good one with all these internal walls and steps intended to accommodate the various levels. The belvedere is positively ugly, and the w.c. outside the door leading from the hall to the billiard-room is not nice. "Don't Know" is improving. He blots and spoils his work without much reason. In the plans sent for this bungalow he has more closely followed the scheme which we proposed than some more capable designers, and as we have spoken on previous occasions of his work somewhat sharply, we may, with good grace, commend his endeavour to do better. He has much room left to continue this development. "Angler" has sent no view. His design might look well. It is very simple, and in plan is L-shaped. The contrivance has its advantages; but the merits are mixed, and so are the sexes, for the man's room is close to the chambers for the maidservants—an arrangement which we specially provided against. "Giaour" makes a belvedere just like a photographer's glass room. The brick arcade along the garden side would be very out of scale and most expensive. His plan is compact rather, but strangely intermingled. Thus the washhouse is reached from a passage opening directly out of the hall. The kitchen is in the basement, and it is situate a considerable way from the dining-room. "Swan" has three corridors running side by side in the middle of his dwelling—an ungainly arrangement—with the idea of separating the parts of the house. A more curious scheme we have never seen. "Swan" should not repeat it. "B. C. P." does not give his design a chance, crowding up his drawings so. His plan is a clever one, and the elevations show no little ability. This house of his is not a bungalow in its external appearance, and it is drawn indifferently. "Rita" makes a timbered magpie house in his design, and locates his kitchen as far away as possible in his rambling plan from the dining-room, thereby increasing the difficulty of service with two series of steps in between the two apartments. Otherwise the plan is not a bad one, though the staircase leading to the smoking-room is needlessly important, with a big well to light the hall. "Derige" makes a village-school sort of building with a tower, for his bungalow, and roughcasts his walls with red-brick dressings—evincing taste it is true; but he rather misdirects his energy. The corridors and hall would be exceedingly dark, and so would the ingle-nook in the drawing-room. The perspective is drawn in a ghost-like way, without any structural lines. "Luna" has a strange composition in black and white timber, based on an oddly-shaped plan. The billiard-room has an apsidal end. The perspective strangely distorts the proportions of the scheme, and looks like a fragment from a willow-patterned plate. "Chess" concludes the series of designs by submitting a very unfinished scheme, the best part of which is the plan. The elevations are drawn in thin outline.

The Indian Government have sanctioned a loan of two lakhs of rupees to the Lahore Municipal Committee during 1898-99, and Mr. B. Parkes, executive engineer on special duty, has been engaged for some time on the plans and estimates for the new drainage and tramway schemes and the extension of the water supply.

IRONWORK AT SOUTH KENSINGTON MUSEUM.—II.

By G. A. T. Middleton.

II.—ENGLISH: IRON GRILLE IN ST. ANSELM'S CHAPEL, CANTERBURY.

This, like much of the English work in the Museum, is a reproduction, the original, dated 1333 A.D., being part of an existing grille in Canterbury Cathedral. It is typical of much contemporary work both in England and on the Continent, made of flat bar-iron in C curves, thinned out and twisted back at the terminals, and with strap and rivet connections, all entirely without foliage or stamped enrichment.

III.—ENGLISH: COPY OF GRILLE, HENRY V. CHANTRY, WESTMINSTER ABBEY.

Like the grille last illustrated, this is a copy, and is as typical of unenriched 15th as that of 14th-century work. It seems to have been made out of sheet metal, stamped and filed, a thicker sheet being superimposed over a thinner, giving somewhat the effect of moulded tracery, a method of working iron more common in Flanders than in England, and there applied mostly to small pieces of door and casket furniture.

HEATING OF SWIMMING-BATHS.

We so often receive inquiries as to the best mode of heating swimming-baths that we think architects will be glad to note the results obtained by Messrs. Messenger and Company, Limited's, improved system. The following report was made by Mr. Wm. Lord, superintendent of the public baths under the Corporation of the City of Coventry, April 28, 1898:—"I forward you inclosed the results of two tests of your heating apparatus as fixed to our three swimming-baths. No. 1 is taken with only 39,370 gallons of water in the bath, and this is raised to 76° before filling up. Test No. 2 is taken with 78,000 gallons of water in the bath. You will see by this that the steam jet is capable of raising 98,437 gallons of water 17° in 9½ hours with one boiler at work. Yesterday I filled the ladies' swimming-bath. We started the jet at seven o'clock, stopped one hour for breakfast, and raised the water from 52° to 76° by five o'clock—that is to say, 98,000 gallons of water were raised in temperature 24° in nine hours. This was with both boilers at about 40lb. pressure, and not condensing anything like as much steam as our steam spray used to do. Furthermore, a perfect circulation is obtained, as will be seen by the statistics I send you, which are taken all over the bath, both top and bottom. Since the apparatus was put in I have had no complaints about the differences in the temperature of the water. We were very busy on Saturday with slipper baths, and your apparatus and hot-tanks were put to a considerable test. I am very pleased to inform you that we made 686 slipper baths without having to call upon the old Calorifier for assistance. Your apparatus is a perfect success, and may be seen at work, if required, as a recommendation for your system."

BOOKS RECEIVED.

The Municipal and Sanitary Engineer's Handbook, by H. Percy Boulnois, M.Inst.C.E., City Engineer, Liverpool, &c. (London: E. and F. N. Spon, Ltd., Strand).—The third edition of this very useful handbook is before us, and has been revised and brought up to date. The legal references have been revised by Mr. J. B. Reignier Conder, the author of "Law Notes on the Surveyor." The contents and arrangement of the book appear to follow the lines of the first edition, and the Public Health Act (1875) and other Acts have been summarised. Chapters I. II. and III. treat on the office and law of the town surveyor, his appointment and qualifications, voluntary pass examinations, his duties, committee work, &c. Traffic, maintenance of streets, requirements of roadway, macadam roadways, road metal, rolling pitched pavements of stone, wood paving, asphalte roadways, curbing and channelling, lighting streets, &c., occupy several chapters. New streets and buildings, sewerage, sewage disposal, public conveniences, lighting, house drainage, pleasure grounds, artisans' dwellings, abattoirs, markets, cemeteries, contracts, &c., are also treated in detail. The handbook is especially valuable to all surveyors and students, and useful data and statistics are summarised. There is a good index.

—*Complete Perspective Course*, by J. HUMPHREY SPANTON, Gold Medallist of Royal Academy of Arts, &c. (London: Macmillan and Co., Ltd.), comprises the elementary and advanced stages of perspective, the projection of shadow and reflections, &c., and the practical application of perspective, and is intended for candidates for the examination of the Science and Art Department, South Kensington, &c. The author has dealt with the subject in a thoroughly complete manner. The problem exercises are admirably suited for the requirements of the examinations referred to, and every case is considered. We should have liked to have seen more practical applications of the problems; the chapter on perspective for architects and engineers at the end of the volume is inadequate to meet their requirements, and we think too much space has been given up to what we may term the academical problems and examples. The diagrams are clear and well engraved: but the objects or examples chosen are confined too much to the conventional school of art models instead of to architectural and practical examples. Such solids as pedestals, columns, bases, towers and spires, cupolas, arcades and interiors, and furniture would have furnished excellent examples of application. The remarks on photographic perspective are useful, and serve to show how an exaggerated perspective of a photograph may be corrected in making a drawing from it.—*Industrial Electricity* (translated and adapted from the French of HENRY DE GRAFFIGNY, and edited by A. G. ELLIOTT, C.Sc. (London: Whittaker and Co., White Hart-street, Paternoster-square), is one of the first of the proposed volumes of Whittaker's "Electro-Mechanical" series. This volume explains in non-mathematical language the many useful applications of electricity. The French original has been extensively sold. The book is intended as an introduction to the series, and each chapter explains briefly and popularly a distinct branch of practical electricity. The other volumes will enter more into detail.—*A Guide to the City Guildhall* (Simpkin, Marshall, Hamilton, Kent, and Co.) Mr. John J. Baddeley, Chairman of the City Lands Committee, has written an excellent guide to the Guildhall, containing a brief but picturesquely-treated historical sketch of the Corporation, and an account of the work carried on by the Court of Common Council. The compilation is profusely illustrated from photographs, and, better still, has on the back page a plan of the labyrinth of buildings—library, art gallery, police and mayor's courts, council chamber, committee rooms, and offices—surrounding the Guildhall. The little book is published in paper covers at 6d. net.

THE COLLAPSE OF THE ROOF OF ABBEY MANSIONS, WESTMINSTER.

AS we briefly mentioned last week, Mr. Troutbeck, assisted by Mr. John Slater as assessor, resumed on Thursday, the 12th inst., the inquest on the seven men killed by the fall of the south section of Abbey Mansions, Victoria and Orchard streets, Westminster. The accident took place on April 21, and in our issue of the following day a double-page illustration of the building was given. James Andrews, the general foreman of the works, who was under examination when the Court adjourned on the previous day, was further questioned by the Coroner with reference to the construction of the pier. He said the footings for the pier were seven courses of brickwork in extent, and 4ft. 1½in. wide at the bottom. According to the terms of the Building Act, footings should be twice the thickness of the wall. He believed the footings were put in for a thicker wall. Mr. W. R. Rickard, the principal contractor, recalled, produced an agreement entered into between himself and Mrs. Leeds, of West Norwood, on November 12 last, under which Mrs. Leeds purchased the freehold and indemnified the witness "from any further personal cost in respect of the completion of the building." Mr. Young, solicitor to Mrs. Leeds, said the short effect of the document was that Mrs. Leeds bought for £1,000 all Rickard's interest in the north and south blocks, and subsequently to that she became the freeholder. The document which had been put in was intended to appoint Rickard as her contractor. Mr. Avory said the document must be read with the building agreement of June 23, 1896, which was in possession of the mortgagee's solicitor. Mr. Young said that by that agreement it was Rickard's venture, and by the subsequent contract he parted with his interest to Mrs. Leeds for £1,000. The witness Rickard said that since Nov. 12, 1897, he had acted as contractor for Mrs. Leeds to erect the building. Certain materials intended for the building were consigned to Mrs. Leeds because that lady's credit was better than his, and in some cases he was authorised to pledge Mrs. Leeds's credit. The cost of the bricks which were condemned was £2 2s. per 1,000 alongside, which was a good price. They were condemned by Mr. Pawley, the architect, at another job. Mr. Pawley told witness that those bricks were rather soft, and ought not to be used for the bottom part of the building. The best of the bricks might have been used for the inside walls. Mr. Avery: When Mr. Pawley condemned these bricks at the other job, did you not lead him to understand that they would be ground up for mortar?—Quite so, or most of them. I do not think they were all bad. Mr. Avory: But all those he condemned you gave him to understand would be ground up for mortar?—Yes. The witness, in reply to further questions, said Mrs. Leeds was the widow of a builder, by whom witness had for many years been employed as building contractor. Mr. Pawley acted merely as architect, and witness paid his fees. Mr. C. W. Courtenay, the contractor for the stonework, gave evidence of supplying stone templates, five of which were of a larger size than the others. Mr. Tom Drew-Bear, engineer, of Queen Victoria-street, said his firm, Drew-Bear, Perks, and Co., supplied some of the girders for the building. He prepared a scheme for the ironwork construction, but it was not carried out, and the girders were supplied according to order. In the plan no provision was made for stanchions. Mr. Samuel Murrell, engineer, Victoria-street, S.W., said he was the contractor for the cast-iron cornice, and he was asked by Mr. Simpson, on behalf of Mrs. Leeds, to concrete the roof, which he had already made. After doing that he started the concreting. The centring and concreting were to be paid for at the rate of 3s. per yard. He did not see any specification as to how the concrete was to be mixed, and he had no instructions. He provided the coke breeze, but the cement and the lifting were found for him. The work of concreting the roof was commenced on March 25. On Wednesday, April 13, the roof had been concreted, with the exception of a portion round the skylight. Later on, there was some discussion with reference to an alteration of the skylight, and eventually some of the concrete was cut away by the order of Andrews, the foreman. By April 16 the whole of the concreting had been finished. None of his men did anything on the roof up till the dinner-hour on the day of the accident. Witness lunched with Mr. Simpson, the assistant architect, on that day, and Mr. Simpson's last words were: "Don't, on any account, let any of your men strike that centring." Witness thereupon told his foreman, the deceased man Parker, through the telephone, not to touch the centring, but to get on with the sixth-floor joists. A little later he heard of the calamity, and on going to the building he found that the centring had been struck. With regard to the alleged improper mixing of the concrete, that material would speak for itself. The cement was given to him by Simpson, and it caused no loss to him no matter how much was used. Assuming that the building collapsed owing to the removal of the centring the concrete would fall in pieces of 3ft. 6in. wide. He could give no reason for the joists falling. His belief was that the accident was caused by someone hoisting a weight by means of a winch and a "snatch" fixed around the pier, so causing the pier to "shoot out." By Mr. Kent: It was dangerous to strike the centring at the time it was struck. John Hammond, a labourer who was at work on the roof at the time of the accident, said he and five other men were instructed by the deceased man Parker to strike the centring. The concrete was very hard, and to test it witness "bounced" a crowbar on it. It sounded like a drum. He was certain that the concrete did not go first. The whole thing collapsed without the slightest warning. He should say the concrete was thoroughly set and fit for striking. He could not say whether there was any hoisting going on at the time. He did not notice any vibration. He saw nothing to account for the collapse. He had known concrete to set well and the centring to be fit for striking in eight days. The portion of the concrete which collapsed had been up a much longer time. At the opening of Monday's proceedings Mr. Horace Avery, counsel for Mr. C. J. C. Pawley, the architect, made a statement with reference to Mr. Pawley's position so far as the property was concerned. The governors of the Grey Coat Hospital were the freeholders, and Mrs. Leeds acquired a building agreement from them with the option of purchasing the land. Mrs. Leeds acquired the freehold, and the deed included a declaration of trust in favour of Mr. Pawley, who was a *cestuique trust*. Then a building agreement was granted to Mr. Rickard, and he subsequently sold it back to Mrs. Leeds for a sum of £1,000. Mrs. Leeds was, in fact, only Mr. Pawley's trustee. It was in the legal position of beneficial owner that he agreed with H.M. Commissioners of Works to grant them a lease of these two blocks when they were completed. Mr. Kent: After November 12 Rickard was working under the direction of Pawley at prime cost. John Peckham, a carpenter in the employment of Messrs. Jas. Smith and Son, of Norwood Junction, the contractors for the joinery work, said he was on the roof of the building at the time of the accident, working at the skylight, which had a deal frame and oak sashes. There were three poles from 4in. to 5in. in diameter properly lashed across the opening, forming a jib. A few minutes before the accident he noticed that there was a great strain on the jib and the block was "squeaking." Something was evidently being raised, but he did not know what. He noticed the breeze concrete cracking. There were two or three distinct cracks parallel with the front wall. He warned his mate that the roof was collapsing, and they both ran to the parapet and jumped on. When they looked round they found that the concrete, iron girders, and everything else had disappeared. He agreed with all that the witness Hammond had stated, except that he was of opinion the concrete round the north skylight was moist. By Mr. Avory: In his opinion the striking of the centring had something to do with the falling of the roof. The concrete appeared to be hard in places, but he considered that it had not been laid long enough for the centring to be struck. By Mr. Ellis Griffith: He had all that day known that the concrete was soft at the spot he had indicated. Thomas Copping, carpenter, who was also at work on the roof at the time of the accident, gave corroborative evidence. When warned by the last witness that the roof was falling, he hurried away to the parapet, and on his way he felt the roof rising slightly. The moment he got on the parapet the whole roof collapsed. The concrete around the frame of the north light was rather soft. The workmen were hoisting by the jib on the centre light right up to the time of the accident. He should say that the scaffold poles forming the jib would carry about a ton. By Mr. Avery: Mr. Murrell did not suggest to him that the hoisting caused the collapse. By Mr. Gardiner: It occurred to him that the striking of the centring was improper, but he did not tell the foreman so. Leonard Skinner, a labourer employed by Banks's Fireproof Syndicate, Ltd., said he never found any of the binding girders tied with ropes. The girders were all fixed and bolted together in the ordinary and proper way. The lacing joists did not bolt. Charles Smith, a labourer in the employment of Mr. Murrell, the roof contractor, said he was one of the men injured in the accident. He was working at the time on a scaffold immediately under the roof, and was drawing the bolts, when suddenly, without warning, the entire roof collapsed. He could not account for the collapse. The concrete appeared to be all right. The boards came clean away. Thomas Stewart, a foreman plumber, said he was employed on the building. On the day of the accident he was on the roof of the south block. He heard a cracking sound like the crushing of a matchbox, and he scrambled to a scaffold. The roof collapsed altogether. The witness, in reply to the coroner, said there were no scaffold poles across the centre skylight for hoisting purposes. The coroner pointed out that that was a distinct contradiction of what other witnesses had sworn to. The witness adhered to his statement, adding that the jib referred to was erected after the collapse. Before the accident the opening of the centre skylight was occupied by the scaffold on which the deceased man Bray was working. There must have been a snatch block, but he did not see it. If there was a jib formed of scaffold poles it must have been below the scaffold under the roof. Henry Alfred Penfold, a scaffolder, said

he was on the sixth floor striking the scaffolding when he saw the hoist go to the front, and everything fell from the roof on to the sixth floor, and thence to the basement. He believed that the poles forming the jib were erected by the contractors for the stonework. At the adjournment the coroner released Mr. Young from further attendance on behalf of Mrs. Leeds.

On Tuesday, William Aspinall, a stonemason in the employment of the Victoria Stone Company, said that at the time of the accident he was on the staircase between the sixth and seventh floors, and the first thing he noticed was the pier falling over towards him. He had no doubt whatever that the pier collapsed first and that the roof followed it. He and his mates hoisted material with the aid of a snatch block attached to a scaffold pole passed through one of the back windows. It was in no way connected with the brick pier, so that any strain which was caused would not affect the pier. The weights raised varied from 2cwt. to 4cwt. William Aspinall, sen., father of the last witness, gave corroborative evidence. Immediately afterwards it collapsed with a crash, and the roof fell in. Frederick George Gander, a scaffolder, employed on the sixth floor of the building at the time of the accident, said he noticed dust flying up above the pier, and immediately afterwards the pier buckled up about the level of the sixth floor. He came to the conclusion that the buckling up was the result of too great a weight being placed on the top of it. The pier stood without support, except that there were iron joists in it, and there was nothing in the middle to steady it. Charles Albert Gander, a labourer, brother of the last witness, corroborated. Edward John Thorp, a bricklayer, said he had a contract with Mr. Rickard for labour only on the brickwork at £4 a rod without scaffolding, and £6 a rod with. He did the whole of the brickwork of the south block. He received instructions from Rickard's general foreman, Andrews, at whose office he saw the plans. The footings were put in for a 2ft. 8in. wall; but the wall was reduced from off the top of the footings to 18in. The pier was built up to the level of the fifth floor five bricks by two-and-a-half bricks thick. From the fifth floor to the roof he reduced the dimensions to 3ft. 9in. by 1ft. 10in. He altered it after a conversation with Andrews, who agreed with him that the pier would be stronger built that way. Three girders ran from each floor to the pier. There were six large templates in the pier, and hard stock bricks and cement were used in its construction—not mortar, as was stated by Collins. He did not know where the bricks came from; but no soft bricks were used in the construction of the pier. It was not true that part of the pier was erected on a template. He attributed the collapse to the fact that the concrete was not properly set, so that when the centring was removed a sheet of concrete between the lacing joists, about 23ft. in length, caved in against the top of the pier, which was the weakest point, and pushed the pier over. By Mr. Avory: On April 18 the concrete generally was soft; he broke it with his fingers. He saw the concrete half an hour before the accident, and he did not think it was in a fit state for the centring to be struck. Concrete of that thickness should be laid at least 21 days to be thoroughly reliable. It was untrue that soft bricks, unfit for use, were used inside the building. He never saw a job better supplied with bricks. By Mr. Ellis Griffith: There might have been 10,000 or 12,000 bricks used. His opinion was asked on each barge load. He complained about the quality of the bricks, and was always told not to use any which he considered unfit for use. By Mr. Kent: All the brickwork in the pier was absolutely sound and good. Harry Sage, foreman scaffolder, described the accident.

On Wednesday Peter White, a man in the employment of the brick contractor, described the collapse of the roof, which he attributed to the centring being struck too soon. He did not agree with previous witnesses that the whole mass came down together. The concrete roof broke in the middle of the lacing joists and left the girders about 10ft. from the pier. He afterwards examined the concrete and found some of it was hard and some very soft. Henry James Homer, another of Mr. Thorp's employés, said the pier was constructed of hard stock bricks and cement. They sometimes made up to the binding girders with cement instead of using a small template. They used some soft bricks in the wall, and Mr. Thorp stopped them at it. He saw nothing but cement used. By Mr. Thomson: He had been at work a fortnight when he and his mates were instructed by Mr. Thorp not to use soft bricks. Not more than 1,000 soft bricks were used in the construction of the wall. He was positive there were not three templates on each floor, as Andrews, the general foreman, had stated, nor were the templates made level with pieces of slate. Elwin George Thorp, son of the brick sub-contractor, said his father informed him just before the crash that Murrell's men were striking the centring too soon. By Mr. Avory: The pier came down in pieces from 3ft. to 4ft. square. The coroner remarked that that showed pretty conclusively what was the character of the brickwork. James Morris, sub-contractor for paint work, spoke to seeing the roof crash through the various floors, the girders in their descent tearing away the brickwork. Thomas Roberts, the foreman carpenter in charge of the joinery work for Messrs. James Smith and Son, the sub-contractors, said the collapse of the building happened in 12 seconds. Mr. Edward Dru Drury, the district surveyor, said he received notice of the proposed erection of Abbey Mansions in March, 1896. He considered the plans and wrote the result of his inspection on August 21. A question had arisen as to whether the building was to be used for domestic purposes, which would have necessitated the reservation of an open space in the rear. That accounted for the delay. He wrote to Mr. Pawley, the architect, pointing out the requirements of the Building Act. It was finally settled by the Building Act Committee of the London County Council. Amended plans were afterwards shown to him by Andrews, and witness found they complied with the terms of the Act. He saw no detail plans. He had no powers with regard to the brick pier. If he considered a pier to be dangerous he could only report it to the London County Council after it was built. He would have control only over cross, external, or party walls. The Building Act said nothing about brick piers. He last visited the building on March 16, when he found that it exceeded the limit allowed by the Act in the height of the front wall in Orchard-street. He called Mr. Rickard's attention to the irregularity, and Rickard wrote on March 25 informing witness that the building was vested in her Majesty's Government, and was therefore, under section 202, exempted from the provisions of the London Building Act. Witness had no control over girders unless they carried a wall. Girders leading to a pier would have nothing to do with him. If a story was constructed in a roof with the floor more than 60ft. above the street it must be built entirely of fireproof materials. The roof of this building did not come particularly under his notice. The brickwork was very good, and the pier was made of stock bricks and cement. It was quite impossible for 1,000 soft bricks to have been used without witness or his assistant seeing them. Section 146 of the Act defined his duties. He could not call attention to a dangerous building until it was erected. After the collapse he procured a sample of the concrete, and found that it was wet, but he did not think that it had been badly mixed. The moisture would add materially to its weight. He saw no concrete that could be crumbled with the hand. If the girders had remained steady and in the place, he did not think the concrete would have fallen. He was of opinion that the pier was carrying two tons more than a safe load, which he calculated would be about 45 tons. The draft lease to which the witness had referred was put in. The coroner said it included an agreement entered into on November 19, 1897, between Mr. Pawley, "hereinafter called the landlord," on the one side, and her Majesty's Commissioners of Works on the other, whereby Mr. Pawley agreed to let the south block of Abbey Mansions on a lease for 21 years from December 25, 1897, "or so soon thereafter as the building shall, in the opinion of the surveyor of her Majesty's Office of Works, be fit for occupation." Mr. Avory said the building was made higher to suit the Government. The coroner expressed the opinion that, as the building had not been finished, it had never been in the occupation of the Government, and therefore was not exempt from the terms of the Building Act. Mr. Fraser said that Mr. Drury could not seek to enforce the Act without coming into collision with H.M. Commissioners of Works. The Coroner said it was a very nice point. Mr. Drury, whom he did not blame, evidently thought the building was exempt, and ceased his supervision of the building after a certain date. Mr. Drury said he had two theories as to the cause of the disaster. The first was that the centring was struck too soon, and that the concrete fell in consequence and levered the pier over; but that theory had been demolished since he had been in Court. He was of opinion that the pier broke because it was not thick enough. The inquiry was adjourned until to-day (Friday).

CHIPS.

The reconstructed Jamaica Bridge at Glasgow will be completed early in 1899. It will be of granite in seven spans, three of the arches being of Cornish granite, and the other four of material from Aberdeen and Fifeshire. The contract is being carried out by Messrs. Morrison and Mason, of Glasgow.

A synagogue is in course of erection from plans by Mr. William Whiddington, of Queen-street, Cheapside, in Fieldgate-street, Whitechapel.

A new board school, Classic in style and three stories in height, is being built in Albion and Hanover streets, Aberdeen. Mr. Arthur Clyne, of Union-street, Aberdeen, is the architect. Accommodation will be provided for 1,000 children.

The scheme for the erection of a Protestant Cathedral for Belfast has advanced a further stage, as to the small nucleus of a building fund a sum of £7,000 appears likely to accrue under the will of the widow of the eighth Earl of Shaftesbury, who died a fortnight ago. By her will, the Countess of Shaftesbury has bequeathed to her trustees the sum of £7,000 free of duty, upon trust, that if at the date of her death, or within five years thereafter, a Protestant cathedral should be erected, or in course of erection in Belfast, to apply the same and any accumulations of income resulting therefrom in or towards the cost of such erection.

It is officially announced that the Queen has appointed the Earl of Iddesleigh, Sir Richard Thorne Thorne, Major General Constantine P. Carey, Mr. Charles P. Cotton, Professor Michael Foster, Colonel Thomas W. Harding, Mr. Thomas W. Killick, Professor W. Ramsay, and Dr. James B. Russell to be a commission to inquire into and report upon the treatment and disposal of sewage. Mr. F. J. Willis is appointed secretary to the commission.

The Scarborough Corporation have resolved to acquire additional property, to the amount of £6,000, for the purposes of the Harcourt-place improvement. This includes Granby House and adjoining property, and the corporation are entering into negotiations for further purchases.

The organ in St. Barnabas' Church, Tunbridge Wells, is about to be enlarged, and placed in a raised position in the organ chamber, at a cost of about £700. The work will be carried out by Messrs. Lewis and Co., of Brixton, who built the instrument.

At Tersnure a new Roman Catholic Church, dedicated to St. Joseph, is in course of erection from designs by Mr. W. H. Byrne, of Suffolk-street, Dublin. The building is Romanesque in style. It consists of nave 46ft. by 30ft., with north and south aisles 14ft. wide, chancel and sanctuary 70ft. in length and 30ft. wide, side chapels and transepts, and a tower and spire rising to a height of 160ft. The architects are Messrs. Michael Meade and Sons, of Great Brunswick-street, Dublin.

The Local Government Board have sanctioned a loan to the Tring Urban District Council of £5,000 for sewerage and sewage-disposal works.

A two manual organ, partly built by the late Mr. Joseph Hopkinson, of Birstall, and completed by Mr. Andrews, of Bradford, has been erected in the Congregational Chapel, Drighlington, at a cost of about £235.

At Middleton Parish Church, Lancashire, of which the late Bishop Durnford was the rector from 1835 up to 1870, when he was called to preside over the Episcopal See of Chichester, the parishioners have, in memory of him, carried out the restoration of the Langley screen (of the Rector's Chapel) and the Rood screen, while in continuation of these a new screen has been erected across the Assheton Chapel in order to commemorate the record reign. The total cost of the work is about £800. Special commemoration services were held last week.

The cemetery committee of the Islington Vestry has accepted the tender of Messrs. Gough and Co., builders, Hendon, for the erection of the chapel for the Nonconformist portion of the cemetery for £3,054.

The restoration of the tower of St. Leonard's Church, Milton, has just been completed. The work has cost £1,400, of which Earl Fitzwilliam, who is lay rector, has contributed £600, besides inserting, at his sole cost, a chiming clock, worth an additional £500, in memory of her Majesty's Jubilee.

OBITUARY.

A PAINFULLY sudden death occurred in Birmingham on Monday morning. Mr. JOHN BLAND, who had for years been in practice at 14, Temple-street, as an architect, being suddenly taken ill in his office, where he died. Mr. Bland, who is said to have been unwell on Sunday, had for some years enjoyed a very extensive practice, and under his direction most of the large carpet factories in Kidderminster, as well as several churches and schools about the Midlands, were erected.

Mr. CHARLES COCHRANE, of the Woodside Ironworks, Stourbridge, and of Middlesbrough, died on Wednesday in last week at his residence, Green Royde, Pedmore, near Stourbridge. He was the eldest son of the late Mr. A. B. Cochrane, of the Woodside Ironworks, who did so much to advance the prestige of the South Staffordshire iron industry. It was from the Woodside Works that came the ironwork of the great Exhibition of 1851, which was re-utilised in the Crystal Palace. Westminster Bridge Cannon-street Railway Station, Charing Cross Railway Station, and Charing Cross Bridge are also among well-known engineering works of the firm, and the Clifton Suspension Bridge is one which Messrs. Cochrane and Co. removed from Hungerford Market, Charing Cross, and re-erected after strengthening it. The Woodside Works, which had been built by Messrs. Cochrane and Bramah in 1841, became exclusively Mr. A. B. Cochrane's in 1853, when Mr. Bramah retired. Mr. A. B. Cochrane died in 1863. The Woodside Works had since belonged to the late Mr. Charles Cochrane and his brother, Mr. J. B. Cochrane; but, besides this, they were greatly interested in the works of Messrs. Cochrane and Co. in Middlesbrough, which was managed by Mr. Charles Cochrane. He had served as Mayor of Dudley, and was on the rolls of Dudley, Worcestershire, and Staffordshire justices. In politics Mr. Cochrane was an ardent Liberal, and he threw himself *con amore* into the election contests at Dudley. He had been one of the mainstays of the Dudley Geological and Scientific Society, to which he recently presented his private collection of fossils.

At a meeting of Volunteers, held at Huddersfield on Monday, it was decided to take steps for the erection of Volunteer headquarters and drill-hall. Subscriptions exceeding £1,990 were announced in the room.

Operations have been commenced this week in the demolition of the Bedford Hall, near Clapham-road railway station, preparatory to the erection of a station on the site in connection with the extension of the City and South London (Electric) Railway from Stockwell to Clapham Common. This will be an intermediate station, and premises at the corner of the High-street and Acre-lane have been acquired and cleared for the building at that point of a terminus.

An extension of some importance is about to be made to the parish church of St. John, Hammersmith, which was erected from the designs of Mr. Wm. Butterfield some years since. The architect now employed is Mr. J. F. Bentley, who is building the Roman Catholic Cathedral at Westminster. The addition to St. John's comprises a morning chapel. The new organ, of which the same architect designed the case, has lately been finished.

The European Commission of the Danube have unanimously decided to commence the execution of a cutting five miles long, 400ft. wide, and 20ft. deep, which, together with former cuttings, will convert the Sulina branch of the river five years hence into an almost straight waterway, 35 miles in length, extending from the port of Sulina to the Tultcha branch of the main river. On the 8th inst. King Charles conferred the Grand Cordon of the Crown of Roumania on Sir Charles Hartley, who has been the engineer-in-chief and consulting engineer of the Commission from its creation till the present time. Since 1872 a member of the Institution of Civil Engineers, Mr. C. Kuhl, has been resident engineer.

The will of the late James O'Byrne, architect, of Liverpool and Birkdale, who died in January last, has been proved in Liverpool. The gross value of the estate has been sworn at £107,335 14s. 3d., and legacies are left to executors, relatives, friends, and servants to the amount of £8,400. Books, curios, plate, articles of vertu, and furniture, of the value of £20,000, the deceased bequeathed to the Roman Catholic Seminary at Upholland, near Wigan, of which building he was the architect. All the real estate, which is valued at £60,000, has been left to Bishop Whiteside, of Liverpool, absolutely. The collection of coins and medals and rare old china is said to be unique in this country.

COMPETITIONS.

BERWICK-ON-TWEED.—An open competition has been held for a new police-court and lock-up to be erected by the Berwick Corporation in Church-street. Thirty-seven designs were sent in, and, after being submitted to the assessor, Mr. J. Crosier, county architect for Durham, have been exhibited in the Rector's Room at the Corporation Academy. Mr. Crosier's report stated that five drawings had been selected by him, as under:—No. 14, estimated cost, £4,945: No. 34, £4,987; No. 35, £3,453; No. 9, £4,900: No. 27, £5,000. These were found when the envelopes were opened to be the numbers of the following architects:—1, R. Burns Dick, 55, Northumberland-street, Newcastle-on-Tyne; 2, Charles Frederick Short, 98, Blenheim-crescent, London, W.; 3, Stephen Piper, 52, Westgate-road, Newcastle-on-Tyne; 4, Fetch and Triggs, 20, John-street, Adelphi, London, W.; 5, Charles T. Marshall, 4, Northumberland-street, Newcastle-on-Tyne. The buildings will consist on the ground floor of a police-station with seven cells and a house for resident constable; and, on the upper floor, of police-court, with magistrates', witness's, and other rooms. The limit of cost is about £5,000.

ROMFORD.—The urban district council of Romford, having decided to erect public swimming-baths in Mawney's-road, Romford, invited designs from architects for the same, and have selected for execution the design submitted by Messrs. Harrington and Ley, of 108, Fenchurch-street, E.C.

WOLVERHAMPTON.—The documents with regard to the competition for designs and plans for the new workhouse at New Cross, Wednesfield, have been issued by the workhouse committee of the Wolverhampton Board of Guardians. It has been decided not to have an open competition for the appointment of an architect, but that the competition shall be limited to three architects, to be selected by the guardians, who are recommended to choose Messrs. Mangnall and Littlewoods, of Manchester, Mr. W. Doubleday, of Birmingham, and Messrs. Marshall and Turner, of Nottingham, to compete, on the terms that the author or authors of the designs and plans selected by the guardians have the appointment of architect at the usual fee of 5 per cent. upon the outlay authorised by the guardians, to include all fees and extras, and that each of the other two competing architects be paid a sum of £100 for their fees and expenses. The accommodation required at the workhouse will include a test-house, with wards for sixty able-bodied men, together with labour-yard and shed for stone-breaking; wards for 350 men, not sick or insane, but partially able-bodied and old, to include a separate day-room, with separate sleeping cubicles in it, partitioned off about 7ft. high, for fifty deserving men; workshops for woodchopping, tailor, shoemaker, carpenter, blacksmith, tinner, matmaking, and oakum-pickers; sheds for carpet-cleaners and for storing wood and oakum—these to be connected with the above wards and the labour yard. Wards for 80 able-bodied women, also for 130 women not sick or insane, but partially able-bodied and old, with separate day-room and sleeping cubicles for 30 deserving women, similar to old men's; separate day-room, with separate cubicles, for 20 married couples, and a separate sewing-room. Infirmary wards for 160 males, 120 females, &c.; and infectious and contagious wards for 20 males and 20 females, with accommodation for two nurses attached; insane wards for 60 males and 60 females, and wards for 30 male and 30 female epileptics. Casual wards for 50 males, on the separate-cell system, and one general room, to provide for an excessive number of males; and for 20 females, consisting of one general ward and six separate cells; lodge and separate entrance for casuals, with rooms for tramp master and his wife: storerooms, kitchen: dining-hall to serve as chapel; laundry, mortuary, disinfecting-room; rooms for officers: offices, nurses' home, master's house; boardroom for guardians' meetings, committee rooms, waiting, bath, and other rooms, &c. The designs are to be delivered by the 1st July next.

At a meeting of the Smethwick Technical Education Board, held on Monday evening, it was decided to invite six local architects to prepare plans for a technical school, and to offer two premiums. It is proposed to build schools in Crockett's-lane at a suggested expenditure of about £5,000.

Engineering Notes.

HASTINGS.—The report of Sir Douglas Fox, who made an examination of the work at Hastings Harbour, has just been issued to members of the town council. He considers the site well selected, but is of opinion that the foundations are of insufficient depth to be left unprotected on the seaward side. Commenting upon this, Mr. A. E. Carey, the engineer-in-chief, says that in his judgment the weight on the foundations is perfectly safe and proper. The local defects discovered, he adds, were not serious, and the contractors were responsible for their repair. Sir Douglas Fox's report proceeds to refer to the danger of scour, and suggests modifications as regards the foundations of the parapet. Other suggestions advised an improved method of continuing the arm and an increase in the thickness of the parapet. Sir Douglas was of opinion that the revised estimate of £226,532 would cover the cost of the works. Mr. Carey thinks that Sir Douglas Fox's schemes for the prevention of scour and with regard to the thickness of the parapet are impracticable, and that the design of the breakwater has been justified by the results.

THE NEW BRIDGE AT NIAGARA.—The second great steel arch bridge which is being built across the gorge at Niagara Falls to take the place of the last of the suspension bridges is to be the largest of its kind in the world. The main arch was completed on April 18. The new bridge is to stand on the site of the upper suspension bridge close to the Falls, and will practically connect the two great free parks at Niagara, the New York State reservation on the one side, and Queen Victoria Niagara Falls Park on the other. The length of the main span is 868ft., and of the flanking spans, the one on the New York State side to be 190ft. long, and the one on the Canadian side to be 210ft. long, making a total length of 1,268ft., which is the length of the bridge it is to supplant. The arch is to be a single deck structure, and its floor will have a width of 49ft. Of this 23ft. in the centre will be given up to a double track for an electric road service across the gorge. On each side of the track there will be carriageways 8ft. wide, and beyond them still there will be footpaths for pedestrians slightly elevated above the roadways. In all, 4,000,000lb. of steel will be used in its construction. It is expected that the structure will be finished by early summer. The arch will be the fourth bridge erected on this site, the first having been thrown open to the public in 1869. It was a wooden bridge, 10ft. wide, and in 1887-88 it was rebuilt in steel and given a width of 17ft. This bridge was destroyed by a hurricane in January, 1889. It was at once rebuilt, and it is this bridge that is now to give way to the new one. When the arch has been completed, the suspension bridge that it supersedes is to be transferred piece by piece seven miles down the river to the site of the old suspension bridge connecting Lewiston, N.Y., and Queenston, Ont., and there rebuilt to take the place of the bridge destroyed by a wind storm in 1864. The chief engineer in charge of the whole work is Mr. L. L. Buck.

CHIPS.

The Admiralty has sanctioned an expenditure of about £15,000, to extend a building slip at Devonport Dockyard.

The Midland Railway Company's bold scheme for a new Lancashire harbour at Heysham is making good progress. The tender of Messrs. Price and Wills, of Westminster, has been accepted at £480,000 for the construction of two breakwaters a mile and a mile and a half in length respectively, and a pier 2,000ft. in length. The harbour will have a water area of 46 acres.

A Greater Malvern has just been created, the amalgamation of the local authorities representing Great Malvern, Little Malvern, Malvern Link, and Malvern Wells having been completed after much negotiation. Henceforth the Malverns, which now have a population of 16,000, an area of 4,300 acres, and a rateable value of £102,000, will be ruled by an urban district council.

The Brighton Recreation Grounds Committee have received a letter from Mr. T. Howard offering to present the corporation with the toll-houses of the old Chain Pier for erection in one of the public pleasure grounds of the borough. It was resolved that the offer be accepted, and that the toll-houses be utilised as park constables' shelters.

Building Intelligence.

Birmingham.—The Norwich Union Fire and Life Assurance Societies have formally entered into possession of the building at the corner of Congreve-street and Edmund-street, which was erected for the Birmingham Liberal Club, and which will now serve as the company's head office for the Midlands. The red-brick and terra-cotta structure cost, with the site, something like £70,000, and was erected in 1884. Shortly after the "split," the building was sold, and the club took up much humbler quarters. The price realised was less than half the original cost. A short time ago the Norwich Office purchased the building for £40,000, and placed it in the hands of the original architects, Messrs. Cossins, Peacock, and Bewley, and the original builders, Messrs. W. and J. Webb, for adaptation to commercial purposes. The ground floor contains the public department of the office. A new Gothic doorway, with stone mouldings in the style of the other arched work of the exterior, has been constructed in Congreve-street. The Fire Department on the left of this entrance, and with a frontage to Edmund-street, has been formed out of the old reading-room of the club, the inner partition wall having been arcaded, and a counter placed along the line of arches. The Life Department occupies what was formerly the entrance-hall and lounge. The office furniture (by Chamberlain, King, and Jones) is of oak, of a design to harmonise with the architecture. The large dining-room has been divided by oak-and-glass screens; but the height of these has been restricted so as to sacrifice as little as possible of the effect of the fine proportions of the room and of the ceiling and other decorative features. Strong-rooms and store-rooms have been constructed in the basement, and the upper rooms have been fitted up as offices.

Bristol.—The Fairfield-road Higher Grade Board School and School of Science is in course of erection. The range of buildings has been erected on a three-cornered site on the sloping side of a hill, the mixed school, science school, and infants' school being grouped in triangle fashion, so as to leave a small playground in the centre and larger playgrounds in two of the angles of the land. The external masonry is of Pennant laid in erratic courses, and relieved by red-brick window and door openings, and terra-cotta decorations. The mixed school has a central hall, 62ft. by 30ft., on the ground floor, and a similar apartment on the floor above, the upper room being loftier, and having an open timber roof. Round these rooms are grouped 10 class-rooms, each 25ft. square, and there are also teachers' rooms, store-room, dining-room, and cloak-rooms. The science school contains a chemical laboratory, a physical laboratory, apparatus-room, lecture-room, drawing-room, &c. The drop in the ground enabled a workshop, 44ft. by 21ft. 6in., to be placed beneath the science floor, and also a cookery-room. The infants' school has a central hall 50ft. by 24ft., with four classrooms and a teachers' room opening from it. The floors throughout are laid with wooden blocks, and firegrates are used in addition to the hot-water pipes. The schools and corridors have a high dado of brown glazed bricks, and above the walls are plastered. The architect is Mr. W. L. Bernard, F.R.I.B.A., and the contractor is Mr. John Perkins, of Redland. The school, which is intended to accommodate 1,054 pupils, will cost £18,142 in addition to £5,110 given for the site.

Bury, Lancs.—The building of new stables for the co-operative society in Knowsley-street, Bury, Lancs, has been recently commenced. The designs, which have been prepared by Mr. T. Nuttall, architect, Market-street, Bury, show that the new buildings are in the Renaissance style of the period of William III. The dressings of the front of the building are in stone from the Morley quarries, Leeds, the main body of the wall being of Ruabon 2in. bricks. The stables are fitted up with Musgrave's (Belfast and Manchester) stable fittings, accommodation being provided for 20 horses, besides sick-room accommodation. The woodwork of the interior is of pitch-pine. The stables are lighted from the top with Heyward Brothers and Eckstein's patent lights. The floor of the stable and the covered way is laid on a bed of concrete, the flooring being of patent grooved brick. The buildings are heated on the hot-water low-pressure system. The contract has been let to Messrs. Thompson and Brierley for between £3,000 and £4,000, and the ventilating and heating arrangements and the electric light fittings are being carried out by Messrs. J. H. Pickup and Co.

Canterbury.—The latest work accomplished in the restoration of the cathedral is the decoration of the screen at the back of the altar, dividing the choir from the Trinity Chapel. Hitherto this has consisted of plain stone and glass, relieved by no ornamentation whatever. The seven centre panels, forming the reredos, are now illustrated with angels, each carrying emblems of the passion. The predominant colours in the stone canopy are gold and red. The whole of the work has been carried out under the superintendence of Mr. Fisher, on behalf of the firm of Messrs. A. O. Hemmings and Co., St. Margaret's-street, London, W.

East Sussex Asylum.—At the last meeting of the East Sussex County Council, the report was received from the visiting committee for providing a new asylum, asking the council to authorise them to purchase the greater part of the Hellingly Park Farm and part of the Park Wood, containing altogether about 400 acres, as a site for the proposed new asylum, for the sum of £16,000, the timber and underwood and tenant right to be paid for by valuation. The committee also asked the council for a grant of £103 10s. 11d. expenses incurred, with a further sum of £1,000 to meet current expenses. In a further report the committee stated that they had appointed Mr. George T. Hine, of 35, Parliament-street, S.W., to be their architect. The committee had succeeded in finding an abundant supply of water on the proposed site at Hellingly at a depth of 176ft. from the surface, which had risen to the bottom of the shaft a height of more than 100ft., but they had not had time to obtain an analysis. The committee had decided to call the new asylum the Amberstone Asylum, if built on the proposed site at Hellingly. The report was adopted with the exception of the last paragraph. Considerable opposition was offered to the proposal to entitle the building Amberstone Asylum, and by 24 votes to 17 it was decided to call it simply the "East Sussex Asylum."

Hull.—The foundation-stone of a new Congregational Church in Prince's-avenue was laid on the 5th inst. The church will be cruciform on plan, having a nave 82ft. long and 28ft. wide, with north and south transepts 18ft. 6in. and 15ft. 6in. in depth respectively, and 23ft. 6in. in width; there are north and south aisles 8ft. 6in. in width separated from the nave by an arcade, having polished granite shafts, with moulded stone bases and caps, the arches being in moulded bricks. The transepts are lighted with mullioned windows, having cusped heads and moulded transoms, the aisle windows being similar, but without transoms. There is a clerestory with mullioned and traceried windows on either side of the nave. The church will seat 585 persons on the ground floor, and 68 in the gallery. The choir is provided for behind the pulpit, and in the rear of the church are the minister's vestry, church parlour, stores, kitchen, and lavatories. The buildings are designed in the Late Gothic style. At the north-west angle of the nave is a tower square at its base, but working out into an octagon, the upper stage of which is pierced by eight gabled openings, surmounted by a moulded and carved tabling, from which rises a stone spire. The west front is flanked by octagonal terminations. The principal frontages are faced with red stock bricks, the dressing to the doors and windows being in Ancaster stone. The roof of the church is in Memel fir, open-timbered up to the level of the collar beam, having mullioned and cusped spandrels, and the ceiling is of a pentagonal form. The whole of the internal walls will be plastered, the arches being in moulded red bricks. The seats throughout are open benches, having sloping backs and seats, and solid cut ends. The choir-stalls have panelled and chamfered open framing in front, with moulded capping and cornice. The pulpit and the whole of the seating will be in pitch-pine varnished. Adjoining the church, and communicating therewith, are the school premises, consisting of a large room 50ft. by 28ft., two classrooms, and an infants' classroom 22ft. by 17ft. The cost of the work is about £4,800. The architect is Mr. W. H. Bingley, Custom House Buildings, Whitefriargate, Hull.

King's Heath.—The opening services of the new Baptist church at King's Heath took place last week. It is built partly on the site of the old chapel. It is 72ft. long by 43ft. wide, has transepts and a large chancel, and will accommodate about 500 persons. The materials used are Leicestershire bricks, with Hollington stone for the dressings and the mullions of the windows. Internally the church has an open timber roof of pitch pine, springing from stone moulded corbels, constructed with bold arched ribs. The floor is on an inclined plane, and the seating is so arranged between the nave piers that every member of the congregation can have an unobstructed view of the minister. Vestries are provided for the minister, deacons, and the choir, and there is also a ladies' room. The church is heated by hot-water pipes, and is ventilated on the automatic principle of Tobin flues in the walls, and exhaust roof ventilators. At the rear is the school erected some time ago. The work has been carried out by Messrs. James Moffat and Sons, of South-road, Camp Hill, from the designs and under the superintendence of the architect, Mr. A. Harrison, of Queen Chambers, Colmore Row, Birmingham. The cost has been £7,000.

Lynton.—The foundation-stones of a town-hall, which Sir George Newnes is presenting to the inhabitants of Lynton and Lynmouth, were laid last week. The hall will occupy a site abutting on Lee-road, with Hollerday, the residence of Sir George Newnes, overlooking it from the high ground above. The hall was designed by Messrs. Reed and Macdonald, of London. The style is Early Elizabethan. It is built of local shambleway stone, with Ham Hill stone dressings. It has a half-timbered front with stone mullioned windows, and red tiled roof. A sundial is to be placed in the main gable over the porch entrance. There will be a library and recreation-rooms, with separate entrances, council-room, surveyor's office, clerk's ditto, and entrance-hall. The main staircase, which will be panelled with oak, has its first flight 12ft. wide, afterwards dividing into two sections, and leading to the main hall on the first floor, which will be oak-panelled also. The main hall, 72ft. by 34ft., will seat 435 persons, and will have an open-timbered roof, with platform arranged for concerts and theatricals, and specially-constructed floor on springs for balls, &c. It is provided with six exits from the main hall, so as to be emptied in three minutes in case of fire.

Manchester. — The new Christie Library which is being added to Owens College is approaching completion. It is being built from designs by the college architects, Messrs. Alfred Waterhouse and Son, Mr. H. Vickers, of Nottingham, being the builder. It is situate to the east of the present college buildings, adjoining Burlington-street, and in close proximity to the Whitworth Hall, also now in course of erection. In style it conforms to the lines followed by the architect in his earlier instalments of the college, although in this case Derbyshire stone is used for facings. The building, measuring 100ft. long by 46ft. wide, is 46ft. high to parapet, and to the ridge of roof 73ft. Space is thus found for three stories. The ground floor, intersected by corridors, is partitioned into seven rooms, all (corridors as well as rooms) to be lined with books. A staircase leads to the first floor, the whole of which is occupied by one apartment, 97ft. by 40ft., and over 20ft. in height, divided down its length by a double range of stone columns into three aisles. Two bays at the north end, set aside to contain the library of the donor, will be cut off from the rest of the room by an oak screen. Including this section, there are in all seven bays, each of which is lighted by windows in pairs 13ft. high, and divided by detached shafts of Derbyshire stone. The plaster ceiling is treated in alternate bays with geometric patterns, the remainder being left plain. The second floor, although entirely in the roof and intended for storage purposes, has a height from floor to apex of 31ft. From end to end runs a central passage 10ft. wide and 22ft. high to the crown of the timber arches of the principals. The room is divided into bays corresponding to those below, and is lighted by two-light dormer windows, piercing the three gables on each side of the room, and, further, by wooden dormers. At each end of the room is placed a window group of five lights. On the north and south elevations is a large blank wall space flanking the three-light windows of the lower floors, decorated only by the arms of the college and those of the donor of the building in panels. At the corners octagonal projections contain the staircases con-

ducting to the light galleries which give access to the higher ranges of the library shelves. The library will be connected with the Whitworth Hall by a corridor conducting to the ground floor, while on the other side a graceful arch supporting a bridge corridor will connect it with the main buildings of the college. The building is heated by hot air introduced in the sills of the windows, and the fittings will be of oak. We illustrated the library in our issue of May 8, 1896.

NUNEATON.—The Birmingham and Midland Counties' Bank, in the Market-place, Nuneaton, was opened last week for business. Messrs. Wood and Kendrick, of West Bromwich, are the architects, and Mr. Councillor Thomas Smith, of Nuneaton, is the contractor. The treatment is Renaissance, a feature of the work being the terra-cotta adornments. The fittings are of mahogany, and have been executed by Messrs. Bennett Bros., Birmingham, the floor of marble mosaic, and the exterior materials used are Heather bricks and buff terracotta. The banking-room is entered at the corner; the room is 42ft. by 36ft. The bank, in addition to fireplaces, will be heated by hot-water radiators. The manager's house has a private entrance from Coventry-street, and has three reception-rooms, six bedrooms, and the kitchen and other accommodation.

TAUNTON.—New almshouses have just been built in St. James'-street, in the place of old and dilapidated almshouses on the opposite side of the street. The architect is Mr. J. H. Spencer, of Hammet-street, Taunton, and the contractor Mr. T. H. Moggridge, of Queen-street, Taunton. They are two stories high, and are built of red Bridgwater brick, with some Bath stone dressings, the roofs being covered with dun colour tiles. Accommodation is provided for six married or twelve single persons, as the case may be, a living-room, bedroom, and scullery being provided for each couple. There are three porches, arranged so that each porch serves as the approach for two sets of rooms. The living-rooms and the bedrooms above are 12ft. by 10ft. in size. The total cost has been about £1,200.

A public hall is about to be built at Newark-on-Trent at a cost of £3,000, from plans by Messrs. Sheppard and Harrison, of that town.

A private meeting of the quarry owners of North Wales has been held at Chester to consider what action should be taken in regard to insurance in view of the Employers' Liability Act, which comes into operation at the end of June. Mr. Nicholson, of Porth-y-Waen Quarries, near Oswestry, was voted to the chair, and the owners present represented wages amounting to £40,000 per annum. The policy was discussed of united action in regard to insurances, but eventually the meeting was adjourned for further inquiries to be made.

The committee for raising a memorial to the late Duchess of Teck have accepted the offer of an anonymous donor to erect and furnish a home of rest for poor working women of London, on the south coast, where, during the year (allowing each occupant a fortnight at a time) some 130 women can be received. With a view to economical management it is intended that the building shall be erected immediately adjoining the Victoria Convalescent Home for Women at Bognor, on a site and in a building provided by the same munificent donor. £11,000 (of which £9,000 has already been subscribed) will be needed for permanent endowment and maintenance.

The London and South-Western Railway Co. are about to carry out an extensive scheme of widening between Vauxhall and Clapham Junction. The narrow and low bridges over the Falcon-road, Latchmere-road, New-road, Stewart's-road, and Queen's-road are being replaced by new girder bridges 40ft. in width, and two additional lines of railway will be provided. Messrs. Perry and Co., of Tredegar Works, Bow, are carrying out the foundations and brickwork, and the girder work for bridges is by the Patent Shaft and Axletree Co., of Wednesbury.

A bank with offices above is about to be built in Dewsbury from plans by Mr. John Lane Fox, architect, of that town. It will occupy the corner of Northgate and New Bridge-street, with doors at the junction of the two thoroughfares, the frontage to the first being 36ft., and to the second 67ft. The height to cornices will be 47ft., and from thence rise lofty roofs with windowed gables. The elevation of the first floor will be of grey polished granite, and that above ashlar from the Holmfirth quarries, relieved with granite bands. The roofs will be covered with green Westmoreland slates, and have a ridge of red tiles. A room for the manager is provided *en suite*, with a strong-room, and there are ten offices on the floor above.

PROFESSIONAL AND TRADE SOCIETIES.

THE AUCTIONEERS' INSTITUTE.—The annual general meeting of the members of the Auctioneers' Institute of the United Kingdom was held at the institute, 57 and 58, Chancery-lane, on Friday afternoon, Mr. J. F. Field, the president, in the chair. In moving the adoption of the report, the president said the past year had been an eminently satisfactory one for the institute. The new members elected numbered 130, and at the end of the year there were 861 members. The income for the year was £1,627, and the expenditure £1,287, and there was a balance to the credit of revenue of £875. The increasing number of entries for the examinations of the institute and the excellence of the work done was very gratifying. The renewed agitation for the amendment of the law of distress had occupied the attention of the council, who received a deputation of bailiffs on the matter. They were now awaiting the representations of those particularly interested in the subject to enable them to arrive at some decision as to what reforms were needed. He expressed the hope that in the near future the institute would be under the protection of a Royal Charter and would be housed in more suitable premises. The report was adopted.—In the evening the 12th annual dinner of the institute was held at the Hotel Cecil. The chair was again taken by the president. After the loyal and patriotic toasts, Mr. Alderman Buckell (Oxford) proposed "The Imperial Parliament," and Mr. Rentoul and Mr. D'Arcy Wyvill responded. The toast of "The Legal Profession," proposed by Mr. D. T. Alexander, was acknowledged by Sir H. B. Poland and Mr. W. A. Blaxland. Sir Walter Wilkin proposed "The Auctioneers' Institute of the United Kingdom," and the president, in reply, remarked that the object of the institute was to raise the status of the profession by the elimination from it of unworthy members. Other toasts followed.

BURY BUILDING TRADES' FEDERATION.—The sixth annual meeting of this federation was held at the Stanley Arms, Bury, Lancs, on Wednesday in last week, the chair being occupied by the President, Mr. E. Wild, of the Joiners' Society. The report of the past year's work and the balance sheet were read and adopted. On the motion of Mr. D. Riley, seconded by Mr. J. Rollinson, Mr. Stanley Hall (plumbers) was elected president, Mr. Walter Park (plumbers) was elected as vice-president, Mr. Walter Harper (stonemasons) was re-elected as secretary, and Mr. J. Rollinson (painters) was re-elected as treasurer. It was decided, after discussion, that the meetings be held quarterly instead of monthly, as at present, the secretary to call special meetings between the quarterly meetings if necessity arose.

LIVERPOOL ARCHITECTURAL SOCIETY.—The annual meeting of this society was held on Monday evening in the new offices of the Law Library, Cook-street, Mr. W. E. Willink (president) in the chair. The annual report, read by Professor F. M. Simpson (honorary secretary), stated that the present membership was 131, compared with 121 last year. The council was pleased to state that the increase in the number of members attending the meetings referred to in last year's report had been fully maintained, and it was hoped that more of the younger members might be induced to read papers and join in the discussions. The report, as well as the financial statement, read by Mr. Dod, were passed. There is a balance in hand of £25 in favour of the society's funds, and of £42 in regard to the library account. The following officers were then re elected:—President, Mr. W. E. Willink, M.A.; vice-presidents, Mr. W. Owen and Mr. J. Woolfall; joint secretaries, Professor F. M. Simpson and Mr. Arnold Thornely; honorary treasurer, Mr. James Dod; and honorary librarian, Mr. J. W. Blakey. The new council consisted of the following:—Fellows, Messrs. C. J. Anderson, H. L. Beckwith, J. W. Blakey, T. E. Eccles, Henry Hartley, William Owen, J. Woolfall; associates, Messrs. F. E. P. Edwards and E. P. Hinde.

NATIONAL ASSOCIATION OF SLATE MERCHANTS AND SLATERS.—The half-yearly conference of this association was held last week at Furness Abbey Hotel. The President (Mr. W. R. Thompson, Dewsbury), in his presidential address, referred to the efforts made by a sub-committee to bring about an arrangement between the large quarry owners in Wales and elsewhere to the mutual advantage of all. Foreign competition was now keenly felt by the trade, and last year the importation of slates from America alone was shown to have been of the value of £200,000. The annual report showed that the membership now stood at 423. Various papers were read. It was determined that the next conference should be held at Bradford.

CHIPS.

New schools are being erected at Cefn Coed, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

The Union Infirmary, Glossop, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues and Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

New offices for the stipendiary magistrate in Moorland-road, Burslem, were formally opened on Monday by the Earl of Dartmouth, lord lieutenant of the county. They have been built from the plans of the late Mr. E. Penn, at a cost of £1,200, exclusive of land and fittings, the contractor being Mr. J. J. Longden.

A report has been made to the Brighton Works Committee from the borough engineer, recommending that the Madeira-road be widened at the narrowest part by the building of a new concrete wall to the south from Camelford-street groyne to the Chain Pier toll-house. Also, that the new timber breastwork, now stopped at Rock-place groyne, be continued westward to meet the new wall. The cost is estimated at £1,750. The committee consider the work necessary.

Princess Christian formally opened the new residence for the clerical and lay workers of the Eton College Mission in Marlborough-road, Hackney Wick. The new building is an imposing edifice in red brick, built at a cost of £4,500, and contains accommodation for nine residents.

A fire broke out on Wednesday at the Union Works, Church-street, Deptford, belonging to Messrs. H. E. Holloway, builders. The fire, which started in a structure two floors high full of combustible material, spread rapidly to the four large buildings used as workshops, engine and boiler-houses, stores, &c. Another fire occurred on Wednesday at 1, Pitt-street, Bethnal-green, E., upon the premises of Mr. A. Copas, builder, and the shop and its contents were almost entirely destroyed.

The Queen has intimated to the East Cowes District Council her willingness to open the new road which has been constructed by her Majesty between the town and Whippingham.

The tramway committee of Glasgow Corporation agreed on Tuesday to increase the salary of Mr. Clark, the engineer, by £50 per annum, and that of Mr. Young, the manager, by £256 per annum, making the salary of the latter £1,500 a year.

At a meeting of the museum and school of art committee of Birmingham corporation, held on Monday, Mr. W. H. Bidlake, M.A., A.R.I.B.A., Waterloo-row, Birmingham, special lecturer on architectural history and architectural design at the Central School of Art, was appointed architect of the new branch school of art in Moseley-road.

The new chapel built in connection with Mill Hill School, from designs by Mr. Basil Champneys, will be formally opened on the 22nd of next month.

Poppyhead stalls for clergy and choir and a bishop's throne have just been placed in the small and ancient cathedral of Clonfert. The work is all in carved oak, and has been executed by Messrs. Sharp and Emery, of Great Brunswick-street, Dublin, from designs by Mr. J. J. Fuller, F.S.A., of that city.

The annual payment of £100 to the British School of Archæology at Athens was voted on Tuesday by Oxford Congregation for another three years.

The City and Brixton Railway Bill, which has already been sanctioned by the House of Commons, has been referred to the Unopposed Bill Committee of the House of Lords, owing to the withdrawal of the threatened opposition. By this Bill a new company will be incorporated, with a share and loan capital of £1,600,000, for the purpose of constructing an electric railway from Brixton-hill to a junction with the City and South London Railway at a point under the High-street, Borough.

The corporation of Liverpool have at the present time under consideration the expenditure of about £40,000 on the building of three distinct fire stations, in addition to its central establishment; this is arranged on the most modern lines, and it possesses a chemical fire engine, the advantage of which is that in fires of small dimensions it is more effective than the ordinary water engine, while it serves to avoid the deluging of burning premises with water, which in many instances does more harm that the fire itself.

ST. PATRICK'S CHURCH AND PRESBYTERY, DUNDEE.—HIGHER GRADE SCHOOL, SCARBOROUGH. — PASSMORE EDWARDS HOLIDAY HOME FOR CHILDREN, CLACTON.—CAPITAL AND COUNTIES BANK, YEOVIL.—DESIGNS FOR HILLSIDE BUNGALOW.—MAISON DE RAPPORT, PARIS.

Our Illustrations.

ST. PATRICK'S CHURCH AND PRESBYTERY, DUNDEE.

The drawing which we give to-day is from the Royal Academy. The church is seated for 800, while the presbytery contains accommodation for three priests—viz., dining-room, three sitting-rooms, parlour, waiting-room, four bedrooms, and kitchen premises, &c. The buildings occupy a prominent site. Externally, the walls are finished in two shades of red stone, the hewn work being from Dumfriesshire, while the natural-faced squared rubble is from Berrymuirhead. The roof is covered with green slates, finished with a red tile ridge. Internally, the floors of the aisles, confessionals, baptistery, and mortuary chapels are tiled, while the sanctuary and space round altars is laid with parquet flooring. The total cost will be about £9,000. The architect is Mr. T. Martin Cappon, Dundee.

HIGHER GRADE SCHOOL, SCARBOROUGH.

The accompanying drawing is in this year's Royal Academy Exhibition. The design was selected in competition early last year. Thirty-six sets of designs were sent in, and the premiums were awarded by the assessor, Mr. E. R. Robson, as follows:—1st, Messrs. Hall, Cooper, and Davis, Scarborough, and 21, Old Queen-street, Westminster; 2nd, Messrs. Demaine and Brierly, York; 3rd, Messrs. Marshall and Dick, Newcastle. The building is constructed of red pressed bricks, with Whitby stone dressings, and roofed with red Ruabon tiles. The architects have endeavoured to combine good proportion in outline and detail with careful treatment in free Renaissance. There are two fronts, that facing Westwood-road on the north being somewhat severe, whilst the south front entirely differs, in the respect that the central block forms an excellent façade with a series of stone columns, heavy dentilled stone cornice, and large sculptured frieze, illustrating "Mathematics," "Letters," "Music," "Crafts," "Chemistry," "Art," &c. The whole of the sculpture has been done by Mr. Henry Fehr. The contractors for the work are as follows:—Brick and stonework, James Bates and Sons; carpenter and joiner, George Seales; plaster, Hugh Proctor; iron and smith's work, Harry Pickup; plumber, Tindall and Williams; painter, Thomas Fidler; tiler, Joseph Hardgraves; fireproof floors, Homan and Rogers, Manchester.

THE PASSMORE EDWARDS HOLIDAY HOME FOR CHILDREN, CLACTON-ON-SEA.

The site is a very fine one, fronting the Marine Parade, in area 1¾ acres. The building will accommodate nearly 100 children, and is planned so that the dining and play-rooms face the sea. The administrative portion is in one block, comprising kitchen, scullery, larder, &c. The matron's room is on one side of the main entrance, with library and elder girls' sitting-room, boot, and cloak-rooms adjacent. Separate entrances are provided for boys and girls, and staircases to their dormitories; but they use the living-rooms in common. All the dormitories face the sea, and are arranged for eight and ten children in a room. Bath-rooms are provided on each floor, and clothes locker. Provision is made for future extensions. All the w.c.'s are outside the building. Red bricks and tiles for roofs are to be used. The architect is Mr Charles Bell, F.R.I.B.A., 3, Salters' Hall-court, Cannon-street, E.C.; and Messrs. Hammond and Son, Romford, are the builders. The contract price is £6,596.

CAPITAL AND COUNTIES BANK, YEOVIL.

The erection of this building is now being proceeded with. The site is a peculiar one, and one of the most important in the town, at the junction of High-street and Princes-street. The building is of Ham stone, and consists of the bank itself on the ground-floor with strong-room in basement. The upper floors are devoted to a manager's residence. The desks, partitions, and fittings of the bank are of oak. Fireproof floors and partitions are to be used, and the bank is to be heated by hot water. Messrs. Bartlett and Son, of Yeovil, are the contractors. The architect is Mr. J. Nicholson Johnston, A.R.I.B.A.

"BUILDING NEWS" DESIGNING CLUB: A HILLSIDE BUNGALOW.

For description and awards see page 700.

MAISON DE RAPPORT, PARIS.

The plans which we give of the Maison de Rapport, No. 71, Boulevard Ornano, Paris, are from the designs of Mr. Charles Blanche, an architect who has had no inconsiderable experience in the erection of buildings of this class. In London, and in many of our larger cities, dwellings, or, as some prefer to call them, mansions in flats, are being erected in some districts on a very large scale. At Hampstead, for example, just now row upon row of residential flats are furnishing the speculating builder with much work, and many an opportunity for the display of ingenious planning, as well as vulgar architecture. A few architects have embarked in speculations of this class themselves, and syndicates are starting other similar undertakings. Shops on the ground-floor frequently have to be provided where there is a chance of good rentals being obtained, and, in most cases, the several floors are repeats of those below. The accompanying illustration has been chosen as an example of planning from Paris where, although in some not unimportant details the French builders differ from English ideas of comfort and sanitary contrivance, some extremely skilful arrangements are to be observed, for our Continental cousins have been for many years a long way in advance of British notions in the matter of residences contrived with a common staircase and common roof. The rather odd shape of the site which Mr. Charles Blanche has so ingeniously built upon, no doubt rendered the architect's task more difficult, while the nature of this building of smaller lodgings made it undesirable to provide the very usual carriage drive into the courtyard. There are, however, two passage-way entries with staircases adjoining, and beyond the court-yard other entrances and staircases are provided. These plans, which we reproduce, are in many ways instructive, and those of our readers who do not subscribe to the *Moniteur des Architects* will be glad to have a copy by them of these plans for reference. Externally, strict economy had to be observed, the bay oriels being the only features used to diversify the plainness of the façade. There are six floors above the ground-floor. The materials used are brick and stone.

A new county cricket-ground adjoining the West Park, Hull, was recently opened. The playing area is an almost complete circle, 170 yards in diameter, with a specially prepared portion 60 yards long by 30 yards wide, for wickets. This has been dug out 2ft., drained, arched, filled in with 18in. of fine loam soil upon 6in. of clinkers, and turfed with sods from the Argyle-street ground. The mean level of the ground is taken for setting out the wickets, and in carrying out the work over 1,500 loads of soil, &c., were carted in for levelling, and some 15,000ft. of drain-pipes were laid, all having an outfall into the manholes. Mr. Percy T. Runton was the architect.

ARCHÆOLOGICAL.

Southampton.—An important discovery has been made by Messrs. Cooksey and Glasspool at Southampton, in connection with the slum demolition. It is that of an ancient vault adjoining the western end of the Undercroft, in Simnel-street. The doorway, now bricked up, at the west end of the Undercroft, leads into the cellar of the adjoining house. The front cellar, opening on to Simnel-street, is of Norman work, and is constructed of stone, well squared and laid. To all appearance, the front was at one time quite open to the street, as the walls are bevelled or chamfered towards Simnel-street. This chamber was some 20ft. deep, the back part of it being of rougher work, but in the front is still to be seen what is described as a Norman cupboard of fine Caen stone, about 2ft. by 2ft. 6in. It is now filled up with rubble and broken lumps of plaster. At the back of this chamber are four corbel tables of Norman character, which carry the struts of the timber floor above. There is also a smaller corbel which carries nothing. The floor above is supported by huge timbers, one said to be of chestnut, and the other with more probability identified as of oak, which appears to be contemporary with the building itself. Some of these timbers having become dangerous, two brick stone piers have been erected, on which are laid transverse beams, which themselves bear evidence of having formed part of an ecclesiastical or important domestic building, the beams being finely moulded with a moulding of the later Early English character. At the rear of this chamber is an archway of Transitional Norman work with a plain chamfer and no capitals, forming a depressed two-centred arch, wide in proportion to its height, which leads into a long Norman barrel vault, some 30ft. by 10ft. At the spring of the arch, on both sides, for the entire length, is a wall-plate or strong course of Norman design. The masonry is rough, with the exception of the strong course. At the furthest end of the vault, the usual ventilating shaft has been plastered up at some period. The back wall is so roughly joined to the vaulting that it looks rather as if the vault had been longer, but had been walled up at some, now very distant, date.

CHIPS.

The urban district council of Cleethorpes have raised the salary of their surveyor, Mr. Egbert Rushton, to £210 per annum.

The magistrates of Arbroath have resolved to fix Saturday, 4th June, for the formal opening of the Free Public Library which has been gifted to the town by Mr. David Corsar, of The Elms.

The urban district council of Bognor have received the sanction of the Local Government Board to borrow the sum of £2,000 for the construction of a sea-wall and esplanade.

The urban district council of Wallasey have decided to purchase the Earlston estate at Liscard, containing a house and about 20 acres of land, from the trustees of the late Anthony Smith, for the sum of £20,000, for the purpose of extending the cemetery.

A monument has been erected in the Jesmond Old Cemetery to the memory of the late Mr. Wm. Laws, builder and contractor, of Heaton-on-Tyne. It stands 19ft. high, on a base of freestone, and is of Rutislaw grey granite, all polished. Upon three base steps stands the die containing the inscription, carrying in turn the cap, supported by four marble columns, the caps and base being granite. On each side are granite pedestals, on which stand the figures of Hope and sympathy, executed in Sicilian marble. Over the capital is a canopy of polished granite, which will cover a portrait bust of the late Mr. Laws, executed in statuary marble, the whole being finished with a draped urn. The memorial has been designed and executed by Mr. B. Donaldson, Red Barns, Newcastle.

The construction of the White Pass and Yukon Railway is being actively pushed on by a large staff of engineers and labourers. The line which is being built will cover the distance from Skagway Harbour to Lake Bennett, and thence to Fort Selkirk. The first section, from Skagway to Lake Bennett, will be open for traffic by September next.

The Convocation of Oxford have authorised the curators of the University chest to expend £7,500 in removing and reconstructing the iron laboratory at the University Museum, at present occupied by the Linacre Professor of Comparative Anatomy, and in erecting on its site a new laboratory and lecture-room for the joint use of the Sherardian Professor of Botany and the Linacre Professor of Comparative Anatomy.

MAISON DE RAPPORT, PARIS.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers so complete volume just ended should order at once, at many of them soon run out of print.

Received.—P. D. A.—I. N. and Co.—S. O.—H. A. G.—N. C.—S. N.—W. V. B.—N. D.

Correspondence.

A MATTER OF LIFE AND DEATH.

To the Editor of the Building News.

Sir,—The long list of iron-column buildings which have collapsed—not in a few hours, but actually in a few minutes—after they once caught fire, has now been added to by the swift destruction of Spurgeon's Tabernacle, at Newington. Six thousand people used to meet there week by week. Six thousand might have been there when it suddenly blazed up the other day, and a thousand or two, in all probability, would then have been roasted alive.

The London County Council, I believe, have the power of issuing, at any moment, regulations which would make it imperative to surround all metal columns in new public buildings of this class with a fireproof casing. Will they do it now, before the Tabernacle is rebuilt, or are they waiting to *see* a congregation burnt alive before they act?—I am, &c., F.R.I.B.A.

WESTMINSTER BUILDING DISASTER.

Sir,—As I find that some misconception has arisen, may I beg the favour of your insertion of a note in your next report of this case, to the effect that I am in no way concerned with the buildings in question.—I am, &c.,

John W. Simpson, A.R.I.B.A.

10, New Inn, Strand, London, W.C., May 18.

A CORRECTION.

Sir,—We beg to draw your attention to an error in your otherwise excellent report of the meeting of the Society of Architects on the 5th inst. As this is calculated to do us some harm, and lead to a misconception, we shall be glad if you will kindly correct it in your next issue. You report me as saying "that we had executed mosaic work in baths at 6d. per square yard." This, of course, is a mistake; it should be 6s. per yard.

Though the price of mosaic has been greatly reduced in recent years, we are very much afraid we shall never be able to do it so low in price as 6d. per yard.—I am, &c., L. Schlantheim.

CHIPS.

In the case of John Crow, of Wickham-road, Brockley, S.E., and Great Bridge, Staffordshire, brick manufacturer, the discharge from bankruptcy has been suspended for two years, ending April 10, 1900.

Sir J. E. Millais's great picture "The Order of Release," lately presented by Mr. Tate to the Gallery of British Art, is now added to the collection of Sir J. E. Millais's pictures in the room set apart for the "Tate Gift."

Some time ago it was decided at a public meeting in Edinburgh to commemorate the late Dean J. F. Montgomery by some permanent memorial. The committee have decided to place a recumbent effigy of the dean in marble in St. Mary's Cathedral. About three-quarters of the necessary sum, £1,000, has been subscribed.

Mr. Walter Armstrong, Director for Art, in the Science and Art Department, will definitely retire from the service in September next. The post, in relation to the art education of the country, is of the greatest importance, therefore in art circles the prospective vacancy is already exciting much interest, and several well-known names are mentioned in connection with it, prominently Mr. Alfred Gilbert, R.A., Mr. Herkomer, R.A., and Mr. Walter Crane.

The foundation-stone of the new Roman Catholic schools at Kendal in memory of the late rector, Dean Gibson, who was 47 years in charge of the mission, has been laid. They are estimated to cost £4,000. On the ground floor are a mixed schoolroom, infants' schoolroom, three classrooms, and the boys' covered playground. At the rear of the buildings are girls' and infants' covered playground, and a workshop for manual instruction.

In the case of John Harvey Coney, Coleman-street, E.C., trading with Charles Morris Cooke as builders, the discharge from bankruptcy has been suspended for two years, ending April 6, 1900.

The Ipswich Corporation have decided to erect a new central fire-brigade station in Bond-street, the old one in Waterworks-street being inadequate in size. Provision is made for the superintendent, deputy superintendent, and watchman to live on the premises, and there is also stabling for three horses, with engine-room, yard, and hose-drying tower. Mr. E. Buckham, M.Inst.C.E., the borough surveyor, prepared the plans, and the tender of Messrs. T. Parkington and Son, of Crown-street, Ipswich, has been accepted for carrying out the work at £3,850. The corporation have also adopted plans by Mr. Buckham for providing a 30in. storm-water overflow sewer into the river at an estimated cost of £4,000.

The work of enlarging the London and North-Western Railway station at Crewe, and providing a complete duplicate of lines through it, is being pushed on with the utmost speed. One thousand men are now at work in the excavations tunnelling, and this number will be greatly augmented as soon as there is additional room for them to work.

The Dean and Chapter of Lincoln have appointed Sir A. W. Blomfield, A.R.A., as architect to the cathedral in succession to the late Mr. John L. Pearson, R.A.

Mr. Arthur Wellesley Soames, M.A., the newly-elected member for South Norfolk, is an architect by profession, and is the youngest son of the late Mr. William Aldwin Soames, of Brighton, and was born on November 30, 1852. He matriculated at Trinity College, Cambridge, graduated in 1877, and proceeded M.A. in 1880. He married, in 1876, Eveline, the eldest daughter of the late Mr. T. Horsman Coles, of St. Helen's. He has twice—in 1892 and 1895—unsuccessfully contested Ipswich as a Liberal, and now enters Parliament for his first time.

A monument is about to be erected in Dundalk to the memory of the men who fought and died for Ireland in the insurrection of 1798. The design is by Mr. Herbert G. Barnes, sculptor, of Dublin, whose offer to execute the work for £2,500 has been accepted. The monument will be of Kilkenny limestone. It will stand about 23ft. high, the statue of a feminine figure holding a flag being 7ft. 6in. high. The base will be about 8ft. square.

Intercommunication.

QUESTIONS.

[11948.]—**Chimney.**—Will any kind reader with experience in building tall chimney-stacks kindly suggest the best method of handling and fixing heavy stone cornice and blocking at top, and oblige?—Stone.

[11949.]—**Perspective.**—Could any reader tell me the method of preparing perspective drawings of villas, public buildings, &c.? I have a knowledge of elementary perspective. Are there any books on the subject on any special instruments required?—Beginner.

[11950.]—**Water at West Norwood.**—Can any of your numerous readers tell me how far I shall have to drill down to find water at West Norwood? How can I tell if there is water below or not?—Daill.

[11951.]—**Artesian Well.**—I am desirous to sink an artesian well in a country district, clay soil, where the surface water supply is short in dry summers and of doubtful quality. There are only seven or eight houses. It is an elevated position. Do you know of any good work on the subject? I have looked up some encyclopædias, but cannot get enough information. Could any of your readers who have knowledge or experience give me any hints as to determining the best position likely to find, and the possible cost?—Vandyke.

[11952.]—**Measurement of Rough Elm.**—Will any of our readers give a correct rule for finding out the actual contents of a log of elm? Here is a rule, which is very old, by Dr. Hutton:—Multiply the square of one-fifth of the girth by twice the length, product equals the content. I have measured up some hundreds of logs after having been cut into plank and board, and although I have allowed for sawkerfs, and actually measured up the offal remaining, the cubical contents of the converted material plus sawdust, plus offal, does not agree with the so-called original contents.—Peggy.

[11953.]—**Tramcar Construction.**—Can anyone inform me as to the peculiar structure of the arch as seen in the roofs of tramcars and omnibuses, whereby it is so stiffened apparently without the use of tie-rods that it is independent of the lateral support usually accorded to arch-work?—the sides of such vehicles being evidently incapable of taking any side-thrust of practical value, and the weight of top of a fully-loaded tramcar must be considerable.—H. R. B.

[11954.]—**Water in Gaspipes.**—Can any reader tell me the best way to fix gaspipes and fittings, so that the water will not collect in the brackets and clog the burners? This occurs mainly where the pipes are most exposed to cold draughts. Would it be well to arrange the pipes to slope downwards towards the meter, as steam-pipes should slope downwards to boiler for return of water? Any hints would oblige.—Nottingham.

[11955.]—**Papier-Mache Bookshelves.**—In Mr. Burgoyne's recent work on "Library Architecture," the above is referred to, but no particulars given. As this is a subject of great importance to architects and librarians, I write in the hope that some of your readers are in a position to state the benefits to be derived from the use of papier-mâché shelves. What thickness is required to make a 30in. by 8in. papier-mâché shelf sufficiently strong for its purpose, and is it likely to warp or bend with long-continued pressure? Further, what would be the cost of such a shelf if an order was given for, say, 500 of like dimensions? Is papier-mâché cheaper than wood, or adapted in any way for library fittings?—Librarian.

REPLIES.

[11944.]—**Cambered Niches.**—Will "A. B." refer to my letter, p. 583, April 22, under heading "Ornamental Brickwork: Arches," for information as to works on the subject of his question?—Aacuitect.

[11946.]—**Hot-Water System.**—From an examination of "H. M. X.'s" system, I should say the circulation, if possible, would be very uncertain and partial. Such a lofty reservoir in connection with the boiler, or in continuation of it, would scarcely get hot, and two currents would be established on one side. A column of hot water would flow up, but be quickly cooled by the descending cold current of water. The large mass of water in the reservoir would be a long time getting warm.—G. H.

Mr. Passmore Edwards will open the new wing of the Pegwell Bay Convalescent Home at Ramsgate on Saturday, July 2.

A report has been issued by Mr. R. G. Nicol, C.E., harbour engineer, Aberdeen, in regard to the reconstruction of Regent Bridge in that town. The new bridge will be of the single-swing type, worked by hydraulic power, and will be sufficiently strong for the heaviest traction engine and cart traffic. The estimated cost is £49,740, of which £4,470 will be required for temporary works.

The ceremony of cutting the first sod in connection with the new drainage scheme to be carried out at Pokesdown, a suburb of Bournemouth, took place on Friday afternoon. The works are to cost about £20,000.

Mr. W. E. Duke died suddenly on a tramcar at Plymouth on Friday. He was chairman of the Lydford Parish Council, and a large employer of labour at the granite quarries near Princetown.

At a recent special meeting of the Morecambe District Council, Mr. Nicolls, C.E., presented plans and details of a sewerage scheme for the district. After some discussion it was resolved that the plans be approved, and that the council make the necessary application to the Local Government Board to sanction the borrowing of £60,000, the cost estimated by Mr. Nicolls.

LEGAL INTELLIGENCE.

WOOD v. MONK AND NEWELL.—On May 6, before Mr. Justice Wills and Mr. Justice Kennedy, sitting as a Divisional Court, in the Queen's Bench Division of the High Court, the case of Wood v. Monk and Newell came on for argument on appeal from the West Bromwich County-court, Staffordshire. Mr. Bankes said this was an appeal by the defendants. The plaintiffs, Messrs. Wood, are brickmakers at West Bromwich, and the defendants Liverpool contractors. The action was brought by plaintiffs to recover the balance of an account for bricks supplied. Defendants, however, put in a counter-claim for loss alleged to have been sustained by the defendants in consequence of the bricks supplied not being of the quality contracted for. The County-court judge held that the counter-claim could not be gone into, nor could the defendants raise any point about the quality of the bricks, because they had accepted them, and not rejected them. Defendants' witnesses were never heard at all on the point, and he never heard of a counter-claim being rejected on such a ground before. It was entirely wrong, he submitted, and the fact was the judge was misled by a somewhat specious case which was quoted to him, which had nothing whatever to do with the case. The blue bricks in question were to be used in some work defendants were doing for the London and North-Western Railway at Heckmondwike, in Yorkshire, and it was stipulated the bricks should be of a quality to satisfy the London and North-Western Railway. Mr. Disturnal argued that the judge was right; but Mr. Justice Wills said it was clear there must be a new trial, as the counter-claim had not been heard at all. Appeal was allowed for a new trial, with costs.

IN RE C. J. WESTWOOD. — An adjourned sitting or public examination was heard before Mr. Registrar Linklater on Tuesday, under a receiving order made against Charles John Westwood, described as a railway contractor, carrying on business at 11 and 12, Clement's-lane, Lombard-street, E.C., under the style of C. J. Westwood and Co. The statement of affairs showed gross liabilities £41,545, of which £13,359 were expected to rank for dividend, with assets £13,329. From 1888 to 1895 the debtor was in partnership with another person as railway and tramway contractors. At the latter date the firm was dissolved, and there were two important contracts then on hand, one being for the construction of a railway in the Transvaal, and the other for the construction of the Newport, Godshill, and St. Lawrance (Isle of Wight) Railway. The debtor's partner took over the first contract, and he took over the second. He also received acceptances amounting to £23,000 in consideration of relinquishing his interest in the Transvaal contract. He discounted the bills and used the proceeds in connection with the Isle of Wight Railway. The contract price was £160,000, payable in shares and debentures as the work progressed. At the date of the receiving order £81,200 shares and £25,900 debentures had been issued. In October last he was compelled to suspend operations, £19,000 further being then required to finish the construction of the line, but arrangements were in progress under which the work would probably be completed and the balance of the shares and debentures taken up. This would enable him to pay his debts in full. The examination was adjourned until July 12 next.

SEWERAGE DISPOSAL DIFFICULTIES AT MANCHESTER. — The Stipendiary Magistrate for the county of Lancashire (Mr. Yates, Q.C.) dismissed, on Friday, the application of the Manchester Corporation for a further extension of the time for constructing sewage works at Davyhulme. He held that the Corporation has at present no effective scheme for dealing with the sewage of the city and the prevention of the pollution of the Ship Canal. The bare facts, he said, were that the sewage of an ever-increasing population, now amounting to 600,000, was being turned into an almost stationary body of water unpurified; that this had been going on to a greater or lesser degree for at least five years; and that the Corporation were no nearer a final settlement of the question than they were in 1893. The Corporation have decided to appeal against this decision.

THE MEDICAL OFFICER OF HEALTH AND HIS ALLEGED INSANITARY HOUSE.—In the Queen's Bench Division of the High Court on Monday, before Mr. Justice Mathew and a special jury, the hearing was concluded of an action in which the trustees of the Sesame Club sought to recover from Dr. James Edmunds, medical officer of health for the parish of St. James's, Piccadilly, damages for fraudulent misrepresentations alleged to have been made by the defendant as to the sanitary condition of a house, No. 39, Dover-street, of which the defendant was the owner, and which the plaintiffs had taken on lease for the purposes of their club. For the plaintiffs it was contended that the defendant had alleged that the sanitary arrangements of the house were perfect, and could not be surpassed, while in fact the drainage was found to be so seriously defective that the whole of the old brick drains in the basement had to be taken up and replaced by new ones. Among the witnesses for plaintiff were Mr. Rogers Field, who said he found the house to be in a most unsanitary condition. The defendant denied that he had made the representations alleged, and that he had given plaintiffs and a Mr. Harvey, who was an architect and a member of the club, the fullest opportunity of examining the house for themselves. In summing up, Mr. Justice Mathews referred to the decision of the House of Lords in Peek v. Derry. The jury, after long deliberation, returned a verdict for the plaintiffs. The question of damages was reserved for further consideration.

DISPUTE AS TO BRICKMAKING ROYALTIES. — BRADSHAW v. BUCHANAN. — At the Liverpool Assizes, on May 11, before Mr. Justice Bruce, sitting without a jury, Richard Bradshaw, a practical brickmaker, of Liverpool, brought an action for royalties, and for damages for infringement of letters patent, against Buchanan and Sons, Caledonia Foundry, Bootle. The dispute had arisen with regard to royalties claimed by the plaintiff in respect of the "Little Wonder" brick-making machine, in connection with which he had taken out two patents. Defendants had made some of the machines on terms agreed upon between the parties, which included payment to the plaintiff of £50 royalty on each machine which was to be sold for £250. Since 1893 plaintiff contended that he had not been paid anything by the defendants, and had not been asked to pass any machines, although several were made. The defence was that at first the agreement between the parties was that defendants should receive £200 on each machine, and as they were sold for £250 the plaintiff received his £50 in every case. It was also agreed that plaintiff should obtain the orders for the machines, and superintend the fixing of them. In 1894 defendants lent plaintiff £20, and a new agreement was made whereby plaintiff agreed to receive only £20 for each machine for which he obtained orders, fixing the machines and paying the carriage on them; he consequently abandoned all right to commission. As a matter of fact he did not again, until April, 1897, ask for commission or royalties, and in the mean time defendants had been paying commission to other persons on orders, besides defraying the cost of carriage and fixing the machines. Mr. Justice Bruce, in giving judgment, said that it was extremely difficult to know what the arrangement was between the parties. He was obliged to be guided to some extent on the probabilities of the case. He considered that the £50 on the machines was to be paid in the nature of a royalty to the plaintiff by the defendants for the use of the former's patent, whether he obtained the order for the machines or not. His Lordship gave judgment for the plaintiff on the claim for £100 with costs, and for the defendants on the admitted counter-claim for money lent for £38 19s. 9d.

The remaining plain window in the baptistery of the parish church, Bury, Lancs, is about to be filled with stained. The artist is Mr. C. E. Kemp, of Nottingham-place, W.

The ceremony of cutting the first sod in connection with No. 1 contract of the Cardiff Railway, for the construction of the line from a junction with the Rhymney Railway, near Roath Park to Tongwynlais, took place last week. The contract has been let to Messrs. Monk and Newell, of Liverpool, and the work will be carried out under the superintendence of Mr. Allen, resident engineer. Sir Douglas Fox and Mr. R. White are the engineers for the line for the Cardiff Railway Company.

Fewer properties are in the auction market at the present time than was the case in May last year, and the returns from Tokenhouse-yard are consequently in arrear. The aggregate realisation last week was £186,056, as compared with £215,576 for the corresponding week in 1897. At the same time, the large amount of business done in the earlier months still places this year in advance of several recent ones. The chief feature of the week was a freehold estate of 50 acres at Streatham, with seven residences, the greater part of the land being available for building operations. Messrs. Farebrother, Ellis, and Co. were the auctioneers for this valuable lot, which was offered on Thursday, but had, however, to be withdrawn at £150,000.

A new railway from Oban along the west coast of Scotland to Ballachulish on Loch Leven is about to be constructed, the Callander and Oban Railway Company having let the contract to Mr. John Best, of Leith, for the railway, and to Messrs. Arrol Brothers for a large bridge on the railway. The line is 28 miles long, and the earthworks are not very heavy. The ruling gradient is one in 70, while much easier gradients predominate. Two narrow inlets of the sea have to be crossed, one by a cantilever bridge 735ft. in length, the other by two centre spans of 150ft. each, and two side spans of 60ft. each. The line is expected to be completed in three years, and Sir. J. Wolfe Barry, K.C.B., is the engineer.

WATER SUPPLY AND SANITARY MATTERS.

THE LONDON WATER SUPPLY.—At Monday's sitting of the Royal Commission, which is inquiring into this subject, evidence was given as to the water supply of Paris by M. Gaston Cadoux, Chef de Bureau at the Prefecture of the Seine. M. Cadoux was of opinion that the arrangement by which the ownership and management of the water supply had been transferred from a private company to the Municipality of Paris had been much to the advantage of the city. Sir A. R. Binnie, engineer-in-chief to the London County Council, was recalled, and gave evidence as to the probable increase in the discharge of sewage into the Thames at Barking and Crossness.—The House of Commons Committee which has been considering the Southwark and Vauxhall Water Company's Bill has found the preamble proved, but subject to the insertion of clauses providing that if the undertaking be purchased within ten years of the passing of the Bill by any public body no additional value shall be deemed to be given to the undertaking by powers conferred by the Bill other than actual expenditure, and also imposing certain restrictions on the quantity of water to be taken by the company from the Thames.

MORECAMBE SEWERAGE —At a special meeting of the Morecambe Urban District Council held on the 17th inst., the details of the sewerage scheme, including that of Bare, were approved, and it was unanimously resolved that application be at once made to the Local Government Board for sanction to borrow £60,000 to carry out the works. The engineer to the scheme is Mr. H. Bertram Nichols, C.E., of Grosvenor Chambers, Corporation-street, Birmingham.

THE WELSH WATER SCHEME FOR BIRMINGHAM. — Steady progress continues to be made with the Welsh water scheme. The completion of the Knighton tunnel was announced on Friday. Forming portions of the conduit from the Elan Valley to Birmingham will be two tunnels, about 8ft. in diameter. One of these, 4½ miles in length, and nearest to the Elan Valley, is the Dolau tunnel. The other is the Knighton tunnel, extending from the town of Knighton to the Lugg Valley, a distance of 2½ miles. Headings for this tunnel were commenced at either end, and at the time of the visit of the Birmingham City Council last spring, 1,700 yards had been driven from Knighton and 1,600 from the other end, leaving about 1,000 yards still to pierce. The two sets of excavators have now been able to join hands. The Dolau tunnel, owing to its greater length and the need for shafts to remove the excavated material, was commenced in two sections. The first half was completed a month ago, and, although the calculations and measurements had to be made upon the data afforded by a base line of only 16ft. at the bottom of a 300ft. shaft, they were so accurately worked out that the centre lines of the two headings met accurately as regards level, and with a horizontal divergence of no more than ½in.

CHIPS.

A cottage hospital—the gift of Mrs. Aitken—is approaching completion at Ramsbottom, Lancs. Mr. C. F. Haywood, of Accrington, is the architect, and the various trades are being carried out by local contractors.

The Lancashire County Council is taking steps with a view to the erection of a new sessions hall in the centre of Preston.

The subscribers to the technical school at Dewsbury have resolved to enlarge the hall at a cost of from £4,500 to £5,000, and have instructed Mr. J. Lane Fox, the architect, to prepare the necessary plans.

Foundation-stones of a new Wesleyan chapel were laid at Branck, Northamptonshire, last week. The building will be Gothic in style, will seat 200 persons, and will cost £560. Mr. William Hinson is the architect, and the contractors are Messrs. Hinson, of Stamford.

The buildings occupied by the Architectural and Eogineering Departments of the Massachusetts Institute of Technology, in Boston, took fire a fortnight since, from the overturning of a tinman's furnace on the roof, and the upper story of the building was destroyed. The valuable library of the Architectural Department, which is kept in the next lower story of the building, narrowly escaped destruction; but fifty students devoted themselves to its rescue, and all of the books and photographs were saved uninjured, though the casts were destroyed. The Engineering Library was saved in the same manner, with the valuable instruments belonging to the department.

A stained-glass window has been placed in the parish church of Larne. It is of two lights, the subjects being the Annunciation and the Nativity, and the artists are Messrs. Guthrie and Wells, of London and Glasgow.

PARLIAMENTARY NOTES.

New Science and Art Buildings.—Sir F. Powell asked the First Commissioner of Works whether, notwithstanding the first report of the Select Committee on the Museums of the Science and Art Department, 1897, plans were now being prepared for the concentration of the Science and Art Departments of the South Kensington Museum on the East side of Exhibition-road; and whether steps were also being taken for the renovation of the Geological Museum in Jermyn-street, though recommendations for its removal had been made by the Select Committee. Mr. Akers-Douglas: According to the announcement made to the House, plans for the proposed new Science and Art buildings are being prepared for the consideration of the inter-Departmental Committee now sitting and for the Government. I have already promised to make a statement to the House directly this Committee reports. In reply to the second question, as the stonework of the building referred to is in a dangerous condition, it is being repaired in accordance with the usual practice of this department.

STATUES, MEMORIALS, &c.

Windsor Castle.—The monument which has been erected by the Prince and Princess of Wales to the memory of the Duke of Clarence and Avondale, in the Albert Chapel at Windsor Castle, has just been completed. It was designed and executed by Mr. Alfred Gilbert, R.A. The sarcophagus of Mexican onyx, which stands in the middle of the chapel, has now been surmounted by a group of statuary wrought in bronze, aluminium, and marble. A recumbent statue representing the Duke of Clarence attired in the uniform of his regiment, the 10th Hussars, and lying in the folds of the Garter robe, reposes upon the gunmetal bier. The military embroidery upon the collar and the cuffs and the aiguillettes are gilded, and the head and hands are sculptured in white marble. In the Prince's right hand is a drawn sword, and round the blade is a spray of olive leaves, the end resting upon an open gilt-edged Bible. The left hand will clasp a crucifix. The lining of the robe is composed of aluminium, and an angelic figure, also cast in aluminium, and holding a gilt corona twined with light foliage, kneels at the head, and near the feet will presently be placed a figure representative of "Love Mourning." The body of the tomb is protected by a bronze railing. This is divided into twelve panels, which are adorned with gilt-winged angels supporting statuettes. Alternating with these, and affixed to the grille pillars, are the escutcheons of various Royal houses, and whose armorial bearings are enamelled in gold and colours upon silver shields, while beneath are representations of the Orders of Knighthood connected with them.

CHIPS.

The Bentham Trustees have presented a fine oil portrait of Robert Brown, the celebrated Scottish botanist, to the museum of the Royal Gardens at Kew.

Cardinal Vaughan laid the foundation-stone of a new Roman Catholic church in Romford-road, Ilford, on Saturday. The fabric has been dedicated to St. Peter and St. Paul.

The Episcopal cathedral in New York is going on slowly, and the trustees are beginning to consider what sort of stone to use for the exterior. The apse is already high above ground, in rough masonry, but will be faced, later, with the stone selected for the whole exterior. The doubt in the minds of the trustees is whether to choose granite or marble, some thinking that marble would be too conspicuous. The *American Architect* strongly advises the choice of one of the Massachusetts marbles, either that from Lee or Stockbridge, both of which have a creamy tint with blue veins.

Mr. Thomas Flood, of Sandy Hill, N.Y., died on April 26, aged 68 years. For 10 years he had been actively engaged as a contractor, and for a large portion of that time confined himself to canal work. His work is to be found on nearly every section of the Erie and Champlain canals. He, in company with Mr. J. H. Sherrill, built the State dam at Cohoes, N.Y.

The Queen has become the possessor of Mr. Holman Hunt's picture "The Beloved," which is at present in the New Gallery. It will be removed to Windsor at the end of June, when her Majesty returns from Balmoral. The Queen has also purchased the water-colour drawing "Portsmouth by the Sea," by William Callow, which is at present on view at the Royal Society of Painters in Water

chapel at Aldemin's Green,
b be rebuilt from plans by Mr.
hat city. It will be faced with
h stone dressings, and the floors
blocks. Accommodation will be
regation of 300 persons.

cr.

Our Office Table.

In the entrance-hall of the Scottish National Portrait Gallery at Edinburgh, there is, at the first floor level, between the antiquarian and art sides of the building, a large square ambulatory carried on pillars, which form a Gothic arcading. Above the spandrels of the arches is a frieze space, and this and the surfaces below it have just been decorated by Mr. W. Hole, R.S.A., the cost being borne by Mr. J. R. Findlay. The paintings, which have been done in spirit fresco on the plaster of the wall, take the form of a procession representative of Scottish history from the earliest to latest times. A special study for the work has been made of costume and armour; and from the time of the Stuarts the portraits are more or less studied from contemporary records. The artist opens the record by painting a female figure symbolical of Caledonia, arrayed in green and purple draperies and golden armour, seated in a megolithic temple, and draws aside a curtain unfolding the past and revealing the future, symbolised by the deep blue vault of heaven spangled with stars. The procession begins with a representation of a man of the Stone Age, driving before him a wolf in a forest. Next is a group representative of the Bronze and Iron Age, who are attired in woven garments, and who carry ornaments and weapons. A group symbolising the Roman occupation of Scotland follows, and the one representing the introduction of Christianity to the country, and after these follow Picts, Culdees, and Vikings. A series of warriors, kings, and queens, and in modern times distinguished men of science, arts, and letters complete the pageant, which includes over 150 figures. The length of each wall is 20ft., the height of the frieze is 4½ft., and the figures have been painted to a 4ft. scale. The scheme is carried out as a piece of flat decoration. The spandrel spaces have been filled in with conventional flower ornament, and over each of the twelve pillars is a shield, on which is emblazoned the arms of Scottish Royal burghs. A scheme has been further sanctioned for the decoration, also by Mr. Hole, of the walls of the ambulatory with a series of Scottish historical scenes.

The annual report of the council of the City and Guilds of London Institute has just been issued. The results of an inquiry made by order of the Treasury into fourteen English University colleges in receipt of Government aid was that the average percentage of expenditure on the teaching staff was 64·9 per cent., while the percentage under the same head at the institute's central technical college was 61·9, and at their technical college, Finsbury, 58·2. At thirteen colleges referred to each student paid on an average 49 per cent. of his annual cost, as compared with 51 per cent. at the central technical college and 34 per cent. at the Finsbury college. With regard to the central college, there had been a steady increase in the number of students seeking admission to the diploma courses of instruction, and 113 entered for the matriculation examination in September last, as against 100 in the previous year. Of the 229 students in regular attendance 96 were taking the engineering course, 78 the physical course, 25 the chemical course, and 31 special courses. The attendance at the Finsbury college also showed a steady increase. The development of the polytechnics round London had, however, affected the attendance of artisans at the trade classes, and steps were being taken to transfer these classes, with the exception of the cabinetmaking class, to an institution of a polytechnic character. The attendance and the high standard of work in the modelling, drawing and painting, and house decoration classes at the South London school had been well maintained, and the competitions for the studentships and medals had brought out some excellent studies. There had been a considerable development in the work of the technological examinations department. The total number of students in attendance at the 1,487 classes in technology only was 30,066, showing an increase of 3,457. The number in attendance at the registered classes for the current session was 34,227. The total expenditure of the institute during the past year amounted to £31,781, and the income was £33,694.

The Lower House of Convocation for Canterbury considered, on Friday, the report of the Committee of the Lower House on Ecclesiastical Dilapidations, and on the motion of the Archdeacon of Wells the following resolutions were agreed to:—(1) That after the experience of the general working of the Act since the year 1871, it is not desirable at present to call upon the Legislature to make any change in the present law. (2) That the attention of their lordships of the Upper House be drawn to the following points:—(*a*) To the fact that in some cases surveyors have been beneficially interested, directly or indirectly, in works executed, which is in contravention of section 11 of the Act. (*b*) To cases of wilful waste during the currency of the five years certificate, see section 47. (*c*) To the discretion which may be exercised before the order is made by the Bishop under section 34.

A correspondent writes that the War has had an unfortunate effect upon the operations of builders and contractors and other firms who are in the habit of using the larger lengths of pitch-pine in the building trade, or in pile-driving. The larger bulks of pitchpine come from the Mississippi and the Missouri, and owing to the War prices have advanced 6d. a foot—viz., from 1s. 8d. to 2s. 2d. It may be stated, however, that one good result of last year's Diamond Jubilee celebration was to increase the stock of this very useful timber in England, and most of the wood used for the erection of grand stands last June is now finding a ready market.

The prize-list for the Department of Architecture and Building Construction of the Glasgow and West of Scotland Technical College, of which branch Professor Charles Gourlay, A.R.I.B.A., is the principal, is as follows:—I.—Architecture.—Junior Class.—First Class Certificates:—1, Colin Sinclair (prize); 2, John M. Arthur (prize); 3, James S. Boyd; 4, John Smith; 5, Julius Bradley; 6, Malcolm Black. Second Class Certificates:—7, Charles P. Barrett; 8, James A. Laird; 9, James Reid; 10, David Martin; 11, Daniel M'Ewan. II.—Architectural Design.—Junior Class.—First Class Certificates:—1, James S. Boyd (prize); 2, John M. Arthur (prize); 3, James A. Laird (prize); 4, John Smith. Second Class Certificate:—5, James Reid. Senior Class in Architecture and Architectural Design.—First Class Certificate and Prize: James M. Alexander. Glasgow Institute of Architects' Prize (value £2 2s.) for best set of sketches and measured drawings (summer work): Charles P. Barrett. III.—Building Construction.—In the first course, 25 first class certificates and prizes were awarded in order of merit to:—John Galt, Donald Grant, William B. Aird, John B. K. M'Taggart, Thomas Ritchie, Andrew Holmes, William M'Kechnie, Robert D. Clyde, William T. Whiteford, James Renwick, James M'Leod, and David C. Young. There were also 27 second class certificates. In the second course, 24 first class certificates were awarded, prizes being granted to James A. Ferguson, William F. Findlay, Robert Park, John Dunn, Alexander Wagstaff, Duncan Grant, and Alexander Craig, and also 21 second class certificates. In the third course, prizes were gained by James Gilmore, Robert B. Donald, James H. Mellis, and James Flett and David Skinner.

A meeting of the Border builders was held in the Good Templar Hall, Galashiels, last week, to consider a proposal to form a company for the district to make provision for the increased responsibility of employers connected with the building trade by the Workmen's Compensation Act, which comes into operation on the 1st of July next. Mr. Adam Herbertson, Galashiels, presided, and explained that it was proposed to form a company with a capital of £1,000 in 1,000 shares of £1 each share, to carry with it a guarantee of £10, such guarantee to be called up, if necessary, for meeting claims for which the premium income and reserve and issued capital might be insufficient. It had been suggested that with a view to acquiring a substantial reserve fund a premium rate of 25s. per £100 in wages paid annual should be fixed at the outset, which, with experience, would be materially reduced. The maximum rate might be 25s., and the minimum rate 12s. 6d., and after payment of the higher premium for three years, firms which had had no accidents during that period might get off on payment of a reduced rate of 12s. 6d. He (Mr. Herbertson) had been in communication with Mr. Selkirk, secretary of the Ocean Accident and Guarantee Association, Limited, of London, who quoted rates for builders at 22s. 6d. per £100 of wages paid, and for some of the other branches of the trade the rates

were correspondingly low. That was for joiners. For saw millers the rates ranged from 25s. to 45s. If they were to avail themselves of these rates, however, they would require to form a branch of the Scottish Building Trades Federation, and he was opposed to having to do with more than one company; he, therefore, favoured the formation of a local company. Mr. Ruthven, plumber, Galashiels, said he heard that the Equitable Company had quoted the rate at 15s., and Bailie Lindsay, Galashiels, said he knew of another London company likely to fix the premium at 17s. He moved that a company be formed for the district, and that the question of rates and other details be left to a future meeting. Mr. Tweedie, plumber, Galashiels, seconded, and this was agreed to. The meeting seemed favourable to reducing the guarantee of £10 pertaining to each share to £5, being confident that this would be ample to meet the requirements of the district.

THE London County Council have adopted a recommendation of the Parks Committee to the effect that, as an experiment, and at a cost to the Technical Education Board, beds be planted in Battersea, Ravenscroft, and Victoria Parks with suitable specimen plants which could be utilised in the teaching of botany, and that a botanical guide be published. The object in view is to afford assistance to scholars at elementary and secondary schools in the study of practical botany. Presumably the same plan will be adopted as that at Kew—species of the different genera being arranged in beds.

FROM time to time, it has been proposed to protect buildings against fire from without by a water-curtain, to be made to fall all around the structure. This scheme is, says an American contemporary just to hand, being put in use at the Chicago Public Library. Mr. N. E. Weydert, supervising architect of the building, is father to the idea, and has received a hearty endorsement of it from Chief Swenie of the Chicago Fire Department. The arrangement is extremely simple. A 7in. steel water-main is being laid around the top of the building, upon the broad stone table formed by the top of the coping. This pipe will be connected to force-pumps in the basement of the building, and, through perforations properly arranged, will insure the introduction of a substantial sheet of water from cornice to pavement, around the whole or any imperilled portion of the building. The system of piping will be so arranged as to be operated in prescribed sections, and additional relays of smaller pipe will be placed in position above windows and doors, to complete the curtaining of those points, should the curtain, in the main, be broken by wind impingement against the building.

THE College of Architecture at Cornell University has followed the lead of Columbia and the University of Pennsylvania, in establishing an annual travelling fellowship in architecture of the value of two thousand dollars. The fellowship is restricted to graduates or special students, who have completed a two years' course, of the College of Architecture, and is to be awarded in competition. The holder is required to spend two years in advanced study, either at Cornell or in Europe, under the direction of the Faculty of the College. The same university also offers each year a graduate fellowship of the annual value of five hundred dollars. All graduates of schools of architecture of approved standing in the United States are eligible as candidates. The fellowship is awarded in June for the following year, and each candidate must submit drawings and other credentials, and file a formal application with the registrar of the university. Application forms may be obtained of Mr. D. F. Hoy, registrar, Ithaca, N.Y., and information relative to the fellowship is given by Professor A. B. Trowbridge, Ithaca, N.Y.

THE old-established firm of Messrs. J. Tyler and Sons is being converted into a limited company with a capital of £200,000, divided into 10,000 5 per cent. cumulative preference shares of £5 each, and 10,000 ordinary £5 shares. The vendors take 3,300 preference shares and 7,500 ordinary shares in part payment of the purchase money. The firm has been established over a century, it is undoubtedly the foremost sanitary business in the City of London, and its profits for the past 16 years abundantly warrant a good return to the investor. The subscription list opens on Tuesday next and closes on Thursday.

IN the course of the discussion after the reading of his paper on "Water-gas" at the Society of Arts, Prof. Vivian B. Lewes said that on the Continent the Dellwik process had the biggest future of any generator for making carburetted water-gas. There, water-gas as it is made in this country and in America, was practically an impossibility, because in Germany, France, and Belgium the price of oil, owing to duties and other factors, was so high that it was impossible to make carburetted water-gas to compete with coal-gas, by the improved Lowe process of breaking up the oil in superheated chambers so as to get oil-gas from it. What had to be done there was to make pure water-gas and carburet that by the products which the gas manager had at his disposal. Extended experiments made by Bunte and others showed that benzole was the most valuable enricher, and that was used by systems much akin to the Maxwell-Clerk type for enrichment on the Continent, and he heard that two of the biggest towns in Germany were adding to their gas supply in that way, large installations on the Dellwik principle being erected at Konigsberg and Posen. They made it by the Dellwik generator, in the proportion of about one-third of the consumption, and, having mixed it with the ordinary coal-gas, they passed the mixture through benzole enrichers, and it formed an excellent illuminating gas. Therein lay the difference between that which was possible in England and that which was possible where they do not get cheap oil. The Dellwik process was, therefore, of enormous value to them. Here it had very small value for such purposes; it would only have a future if our oil supply were interfered with.

CHIPS.

Mr. Wm. Oxtoby, at present chief surveyor of Poplar, has been elected surveyor and engineer of the parish of Camberwell. There were 55 applications. The successful candidate is 36 years of age. He was articled to Mr. J. Fox Sharp, borough engineer, Hull, from 1879 to 1883, and has since been borough surveyor of Beverley for two years, and of Ramsgate for three years, afterwards entering the service of the Poplar District Board of Works as chief surveyor.

A new church, seating some 600 people, and costing about £4,000, was dedicated on Tuesday by the Bishop of Winchester at Winton, a suburb of Bournemouth.

A considerable portion of the Congregational Chapel at Kingswood Hill, near Bristol, including the gallery, was destroyed by fire on Tuesday morning. The damage is estimated at over £1,000.

New oak seating has been placed in the body and south chapel of the fine Gothic church of St. Giles', Newcastle-under-Lyme, Staffs, at the cost of Mr. Edward Turner, who had previously given the oak pulpit and Communion rails, the clock in the tower, and had rehung the bells. The present gift was undertaken by him at a cost of £1,000, to commemorate the Queen's Diamond Jubilee. The work has been executed by Messrs. Jones and Willis, of Birmingham and London, from the designs of Mr. John Lewis, of Newcastle.

Mr. G. W. Willcocks, one of the inspectors of the Local Government Board, conducted an inquiry at Birmingham, on Tuesday, relative to an application by the corporation for power to borrow moneys amounting altogether to £38,010, for the purpose of carrying out various municipal works—£27,200 for street improvements, £4,610 for sewerage, £2,500 for the purchase of the leasehold interest in land for market purposes, £600 for payment to the Great Western Railway Company for the widening of Musgrave-road and Bacchus-road Bridges, £600 for the diversion and covering in of the Spark Brook, £500 for the provision of additional stabling at Harborne Wharf, and £2,000 for purposes in connection with the laying-out of Harborne Recreation Ground. There was no opposition to the various proposals.

At St. Joseph's Roman Catholic Church, Carrickmacross, a bell was formally blessed last week. It cost £200, and has been founded by Mr. Byrne, of Dublin.

On Friday Colonel Hepper, D.S.O., R.E., held a Local Government Board inquiry at the Davenport Arms, Calveley, with reference to an application of the Nantwich Rural District Council for sanction to borrow the sums of £1,700 and £1,550, for the purposes of carrying out works of water supply in the townships of Alpraham and Calveley.

At Dewsbury an arcade is about to be built extending from the Market-place to New Bridge-street. The buildings on either side will be of two stories, and at the entrances will be loftier premises. Messrs. Kale and Sons, of Dewsbury, are the architects.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Northern Architectural Association. Visits to Sandyford Board Schools and the Grand Theatre, Raby-street Board Schools and Presbyterian Church, Heaton. Leave Grey Monument by brake at 2.30 p.m.

MONDAY.—Society of Arts. "Electric Traction," Cantor Lecture No. 4. by Professor C. A. Carus Wilson, of McGill University, Montreal. 8 p.m.

Carpenters' Hall, London Wall, E.C. "Timber Roofs: Tie Beam and Hammer Beam," by John Slater, B.A., F.R.I.B.A. 7.30 p.m.

TUESDAY.—Society of Arts. "The Goldfields of British Columbia," by W. Hamilton Merritt. 4.30 p.m.

THURSDAY.—Architectural Association. Annual Dinner, Holborn Restaurant. 7 for 7.30 p.m.

Society of Architects. Special meetiog to coosider alteratioo of Article of Association 11A: Lecture on "Library Construction and Arrangement" (illustrated by lantern slides), by C. Davis, librarian of Wandsworth Free Library. St. James's Hall, Piccadilly. 8 p.m.

The Society of Architects.

Founded 1884. Incorporated 1893.

A GENERAL MEETING of the Society of Architects will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, May 26th, 1898, at Eight o'clock p.m., when Mr. C. DAVIES, Chief Librarian of Wandsworth Free Public Library, will read a Paper on the subject of "LIBRARY CONSTRUCTION AND ARRANGEMENT," which will be illustrated by the lantern.

ELLIS MARSLAND, Hon. Sec.
MONTAGU BALDWIN, M.A., Sec.

CHIPS.

Major-General H. Darley Crozier, R.E., Local Government Board Inspector, held an inquiry at Deal last week into the application of the town council for sanction to borrow £36,350 for proposed works of sewerage.

Messrs. Douglas Young and Co. have sold the building estate at Norbury, comprising 59 acres, at the sum of £17,000. This disposes of four out of the five estates offered by this firm in the sale which aroused so much public interest in July last. The remainder of the West Worthing Estate is announced for sale on June 3.

Mr. E. A. Sandford Fawcett, A.M.I.C.E., an inspector of the Local Government Board, held an inquiry on Tuesday relative to the application of the corporation of Rotherham for sanction to borrow £4,000 for purposes of public baths. Ten years ago public baths were erected and a loan was obtained amounting to £4,100. Of this, there is still owing £3,654. Practically ever since the opening ceremony took place serious leakages have occurred, owing to the foundations having given way, and in repairs and additions no less than £3,345 have since been spent on the undertaking. One of the swimming-baths has now been demolished, and, in order to get sound foundations for the new structure, steel tubes 4ft. in diameter filled with concrete have been bored down to a depth of over 20ft.

The foundation-stone of a Primitive Methodist Mission-chapel and school was laid in Midland-road, Peterborough, on the 12th inst. The building is being erected at a cost of £650, from plans by Messrs. Kerridge and Sons, of Wisbech, the contractors being Messrs. Watson and Lucas, of Dogsthorpe-road, Peterborough.

At Monday's meeting of the rural district council of Cuckfield, it was announced that sanction had been received from the Local Government Board to the following loans for the purposes of water supply—viz., Ardingly, £6,615; Balcombe, £10,891; Bolney, £5,163; Cuckfield Rural, £10,758; Lindfield, £17,209; Slaugham, £9,364; total, £60,000. Sanction for the loan for the purchase of the waterworks was also received.

The Bishop of Liverpool, on Saturday, opened the Clarke Memorial Schools, Southport, which have cost £6,600. The building occupies the site of the old schools, at the east end of the church, and its chief features are the large number of classrooms and a playground on the roof. By the removal of sliding and revolving partitions, a large hall can be formed on the first floor, capable of accommodating 800 persons.

Mr. D. W. Stevenson, R.S.A., of Edinburgh, has just modelled in the clay the colossal statue of Burns, for Leith. The figure, 9ft. in height, is firmly poised on the right foot, with the left slightly advanced. He wears the coat of the period, with open throat and ample collar and lapels; and his attire further consists of long waistcoat, knee-breeches, ribbed hose, shoes, and a plaid thrown over the left shoulder. The figure, which will be cast in bronze, will stand on pedestal 10ft. high.

Trade News.

WAGES MOVEMENTS.

The State of the Labour Market.—The monthly memorandum for April prepared by the Labour Department reports that the state of employment is generally good, except in industries affected by the stoppage in the South Wales coal trade. In the 116 trade unions making returns, with an aggregate membership of 466,405, 13,546 (or 2·9 per cent.) were reported as unemployed at the end of April, compared with 3·1 per cent. at the end of March, and with 2·5 per cent. in the 114 unions, with a membership of 455,157, from which returns were received for April, 1897. Employment in the building trades is brisk, the percentage of unemployed union members being 1·1, compared with 1·6 in March and 1·0 per cent. in April, 1897. The furnishing trades remain busy. The percentage of unemployed union members at the end of April was 1·2, compared with 1·3 in March and 0·5 in April last year. Changes in the rates of wages of about 132,400 workpeople were reported during April, of which number 131,500 received advances, and 900 sustained decreases. The increases were mainly in the mining (113,895) and building trade (14,797) industries. The net result was an increase estimated at about 3s. 2d. per head in the weekly wages of those affected. Forty-four fresh disputes began in April, 1898, involving 130,528 workpeople, and of these no fewer than twenty took place in the building trades.

Carpenters' and Joiners' Wages Increased.—The executive of the Amalgamated Society of Carpenters and Joiners, in their official monthly report, issued to the branches, which now number 738, state that lately a record of unprecedented successes in respect to the amicable and satisfactory settlement of the various trade movements has been established. The report further states that advances of wages have been conceded by employers as follows:—At Castleford, Coalville, Cromer, Colwyn Bay, Liverpool, Lynn, Lincoln, Mansfield, Preston, Rushden, Leeds, and Gravesend of ½d. per hour. At Birmingham an advance of ½d. per hour will come into effect next October. All overtime there, too, is to be paid for at the rate of time and a half. At Leicester a reduction of hours and increased payment for overtime, under the recommendation of the Board of Trade arbitrator, has been agreed upon; at Whitby an advance of 2s. weekly has been conceded. Alterations in hours have also been effected at Edinburgh, Leeds, Stockton, Carlisle, Maidstone, and Bournemouth.

Cheltenham.—Some time since a dispute arose in Cheltenham, between carpenters and their employers, as to the rate of wages to be paid, and the case was eventually submitted to arbitration. The men applied for an increase from 7d. to 7½d. per hour, on the grounds that stonemasons and plumbers received 7¾d. and 7½d. respectively, that wages had been raised in other towns, and that there was a considerable demand for labour just now in Cheltenham. Against this it is pointed out that the masons lose time in bad weather, that plumbing is unhealthy, that the rate of wages in Gloucester, Bath, Torquay, and other similar towns is 7d., while in winter months Cheltenham hours are shorter. The case was submitted to the Rev. G. L. Gardner, vicar of All Saint's, whose award was that for the present the increase ought not to be granted, and that the wages of the carpenters and joiners should remain at 7d. an hour.

Manchester.—The stonemasons have made a series of applications to their employers which include an alteration in the working hours and an addition to the rate of wages per hour. They also object to the employment of workmen on stone-dressing machines at the lower rate of wages than those paid to stonemasons, by whom the work was formerly done, and to the importation of worked or dressed stone into Manchester. A limitation of the number of apprentices is also proposed. The application will be resisted by the Employers' Federation, which includes a large number of contractors and builders in all the principal towns of Lancashire. A number of stonemasons, having previously sent in their notices, for operation in the event of a refusal by the employers to grant the alterations asked for, did not resume work on Monday.

Rochdale.—The strike of bricksetters' labourers in the Rochdale district has entirely collapsed; but there is no change in the situation as regards the strike of operative stonemasons.

Stockport.—Nearly all building work at Stockport is at a standstill, owing to a dispute between the master builders and the bricklayers. For this reason the erection of the corporation electric light-station works at Millgate is temporarily [illegible] building of the district council [illegible]e, a Stockport builder having [illegible]e question at issue is with the [illegible]s' Association, and has refer- [illegible]oints from which the meu are [illegible]time" to the buildings where they are employed. In Manchester the radius is two miles from the Exchange. The Stockport employers contend that under their propositions the radius would be not more than a mile and a mile and a half from the centre of the town, and and that a recent advance in the wages of the bricklayers was accompanied by a tacit understanding that the boundaries would be extended, in proof of which assertion it is pointed out that the joiners, masons, and painters have accepted the new boundaries. The old "walking places" have been observed for 25 years, and the bricklayers decline to accept any alteration in the most important routes north and south. An advertisement for men has failed to bring the employers the desired relief, owing to the briskness of the building trade in all surrounding districts.

Tyneside.—There is a general movement in the building trades on Tyneside for advances of wages. With regard to the joiners, mill sawyers, woodcutters, and machinists, application was made for the whole Tyne District, including Blyth and North and South Shields. The employers of Newcastle, Gateshead, and South Shields offered ½d. per hour advance, which was officially accepted on Friday. It is expected that Blyth and North Shields employers will come in line, and so avoid the threatened rupture.

Weston-super-Mare.—The master builders having withdrawn their demand with respect to the alteration of the working rules of the Amalgamated Society of Carpenters and Joiners, and having signed the rules as submitted, the men resumed work on Monday.

CHIPS.

Plans have been prepared for large additions to the Wilts County Council offices on the Parade at Trowbridge, involving an expenditure of about £6,000.

On Saturday the members of the Birmingham Clerks of Works and Builders' Foremen's Association were conducted over the new Hen and Chickens Hotel, New-street, in that city, by Mr. John Moffat, the builder.

Viscount Portman opened, on Friday, the Morley Hall and Gymnasium, George-street, Hanover-square. The hall, which cost £4,000, is the gift of Mr. Howard Morley and a memorial of Mr. Samuel Morley, and is an addition to the premises of the Young Women's Christian Association, purchased some time ago at a cost of £24,000.

The town council of Haddington decided, on Monday, to instruct Messrs. Belfrage and Carfrae, civil engineers, of Edinburgh, to prepare working drawings and specifications for a new bridge over the river at the end of Market-street.

Colonel Marsh, R.E., an inspector from the Local Government Board, held an inquiry at Southampton on Wednesday into an application for leave to borrow £28,428 for water supply, £500 shed accommodation at the corporation wharf, £380 for the purchase of the steam roller, £300 for filter-beds at the corporation baths, and £125 for street improvements.

A new suburban railway-station, to be known as St. Anne's Park, is to be opened at Brislington, Bristol, by the Great Western Railway Company on Monday next. The contractor was Mr. S. Robertson, of Bristol.

The Eastbourne light railway scheme, which was intended to have opened up the district between Eastbourne and Seaford, was rejected by the commissioners on Saturday.

It is proposed to restore the parish church of Dibden, Hants, from plans prepared by Mr. Percy G. Stone, F.R.I.B.A.

To celebrate the enlargement of the Lamberhurst Brewery to double its original capacity, a company were entertained to dinner on Tuesday week by the proprietors, Messrs. Smith, in the Brewery Hall. The enlarged building has been practically rebuilt and re-equipped. Mr. Louis Beale, of Tunbridge Wells, was the contractor, and the engineer was Mr. R. W. Andrews, of High Holborn.

FRIDAY, MAY 27, 1898.

NATURAL ART.

THE art of concealment makes a large demand on the architect of to day. The old and trite adage *Ars celare artem* has not yet been learned by those who deal in architectural style—they are for ever trying to show and display their art instead of concealing it. Only true art genius has ever been able to make art natural. Instead of concealing the methods and results of art, the modern professor is for ever trying to make the most of what he has learned. Instead of concealing art and treating his materials naturally, he just reverses the process—he exhibits the formula of his knowledge by disguising or counterfeiting his materials. Modern architecture is largely an art of semblances, of representing types and patterns, of appearing to be something that it is not. Evidences of the most expensive materials and elaborate workmanship are put forward for which there is not the slightest foundation.

Seeming that which is not is one of the commonest weaknesses of modern architectural work. At one period there was no difficulty in tracing to its origin the motive of any particular design—everything was plain and outspoken: the column expressed support, the arch economy of construction, and every little detail had a meaning at once direct and expressive. It is far from being the case now. Modern resources have opened to us numerous temptations in the way of materials and methods of construction at once tractable and dishonest. We are tempted to use even granite and marble, in a manner quite unreal and defiant of their very nature and properties, as mere slabs and veneers for casing our iron supports; artificial stone and concrete are turned into all kinds of semblances to stone construction. Many plastic substances are applied to represent almost anything: textiles, carving, metal and stone work, besides the legitimate uses to which they ought to be applied. The limitation of materials and all that the term implies is entirely ignored. Again, when we can rear gigantic façades of any style on plate-glass windows or fragile metal columns, it is not easy to see where we are to stop in this factitious and unreal progress. When a few pieces of iron or steel can be so arranged as to carry almost any weight, or erected as a skeleton structure that can be clothed with thin materials or slabs, the temptation is strong to employ the features and details of a masonry architecture, and thus we see in the streets of New York, Chicago, and other cities of the West lofty tenement houses posing as palaces or Italian campanili, designs suitable only for stone or marble—mere skin-deep representations of solid building. Can we be surprised if the same unreality has appeared on this side of the Atlantic? We are not speaking of those who are working on a higher plane, who have come to realise what art in building means, and how it should be applied to our every-day wants, but of the ordinary modern building and its pretence to architecture we see in our streets. We see this pretentiousness unblushingly manifested in large business premises, in our new hotels and restaurants, where everything assumes to be of the costliest and most sumptuous description, and where the appearance of labour is courted in every detail, from the counter or bar and its accessory furniture to the walls and ceilings. Nothing can be too elaborate or decorative for these buildings. A lavishness of display in carving, turning, fretwork, modelled ceilings, coloured glass, mirrors, polished metal, and painted enrichments meets us at every turn. But what is it all worth? The most superficial glance is enough to convince the expert eye of the fraud. If it is a piece of ornament on the top of a screen, or a buffet sideboard full of curves and scrolls, or bristling with finials, we perceive at once that it has all been done by the lathe or the fret-saw, or patterns are cut in half and reversed. The ostensible hand-carved work turns out to be only composition or embossed work stuck on to the surface of the wood, the profusely-carved stone capital is cast work put up in pieces, or, if really carved, it is a mere slab of stone fixed round the top of a cased stanchion. The fraud does not stop at the fittings: it extends to the architecture of the interior. The floor, walls, and ceiling proclaim the lie. They are all covered with something that represents a more costly material than wood or brick or plaster; but, not content with display of costly material, they are also treated in a manner no mason or carver of any repute would tolerate. And it is this fraud upon fraud, this redundant and profuse ornamentation, which shocks the feeling of propriety and common sense. Moderation seems to be impossible after certain limits are past; all is license of that baneful pernicious kind which ran riot during the excesses of the art of the French Rococo or Louis XIV. style, and which closed in the revolt that followed under the Empire. And is this not the end of all unrestraint, political as well as artistic? History repeats itself; the same lesson is enforced and has to be learned again every age. We have examples everywhere. We can appeal to any great period for evidence of naturalness.

Formulas, it has been justly said, are good to exhibit the knowledge of him who gives them; but they are useless to the practical worker who allows himself to be directed by his instinct or his experience. Forgetfulness of this fact has led to our present absurd position of adopting the formulas of systems of building which are now defunct. So it has been with those who have been reproducing Greek, Renaissance, and Gothic on all occasions in our time, without so much as once reverting to the principles the old builders were actuated by. Viollet le Duc, in his admirable article on Construction, in the *Dictionnaire Raisonné de l'Architecture Français*, makes many excellent remarks that may be usefully considered in this connection. Speaking of the spirit and principles which actuated the old Gothic builders and those modern followers of the art in his time who have gone so far astray as to make very ridiculous applications of Gothic, he invites us to consider the principles, instead of the traditions or formulas which underlie the Gothic. That great system, he observes, is the safest initiation into modern art, if we only work on the principles on which it was based. It had broken with antique traditions. It matters little, he says, whether a bell-tower be covered with ornaments which are not to the taste of such and such a school, if this bell-tower have a reason for its existence, if its function is necessary, if it permit us to take up less room on the public way. Beauty is not, in an art, wholly conventional and logical, linked for ever to one single form; it can always reside there when the form is but the expression of satisfied need, of judicious use of material. Because the multitude sees in Gothic architecture only its ornamentation, and because this ornamentation no longer belongs to our time—is this a proof that the construction of these edifices can no longer find an application? One might, he says, just as well maintain that a treatise on geometry is worth nothing because it is printed in Gothic characters, and that the students reading any theorem are learning mere folly, and are being misled; and he goes on to show that Gothic construction is not like the Classic, immutable and absolute, but is as free and inquiring as the modern spirit. The builders of those times were not baffled by routine, by exclusive dogmas, or systems. And so it may be now, if only we could learn to be more honest to ourselves and our requirements. We shall never do much till we have learnt to be natural with our materials. Technical education in building trades will never teach us by the employment of mere conventions. The teaching of youths to design palaces and cathedrals according to historic precedents or formulas is like teaching them to become poets by copying Chaucer's style; instructing a boy to make a cardboard model of Canterbury Cathedral or the Parthenon only makes him an adept as a mimic. The modern architect has much to fight against—machine tools, mechanical labour, past traditions in his profession—all influences which serve to perpetuate the cut-and-dried methods of art, and the loss of that directness of method which distinguished the early work. Easy reproduction by mechanical means is more favourable to the large capitalist and manufacturer than executing work by the hand in a direct and simple manner; added to which is the desire to give the appearance of labour at the least cost. These are the incentives to the substitution of artificial for natural art and honest intentions.

MODEL SPECIFICATIONS.—XIV.

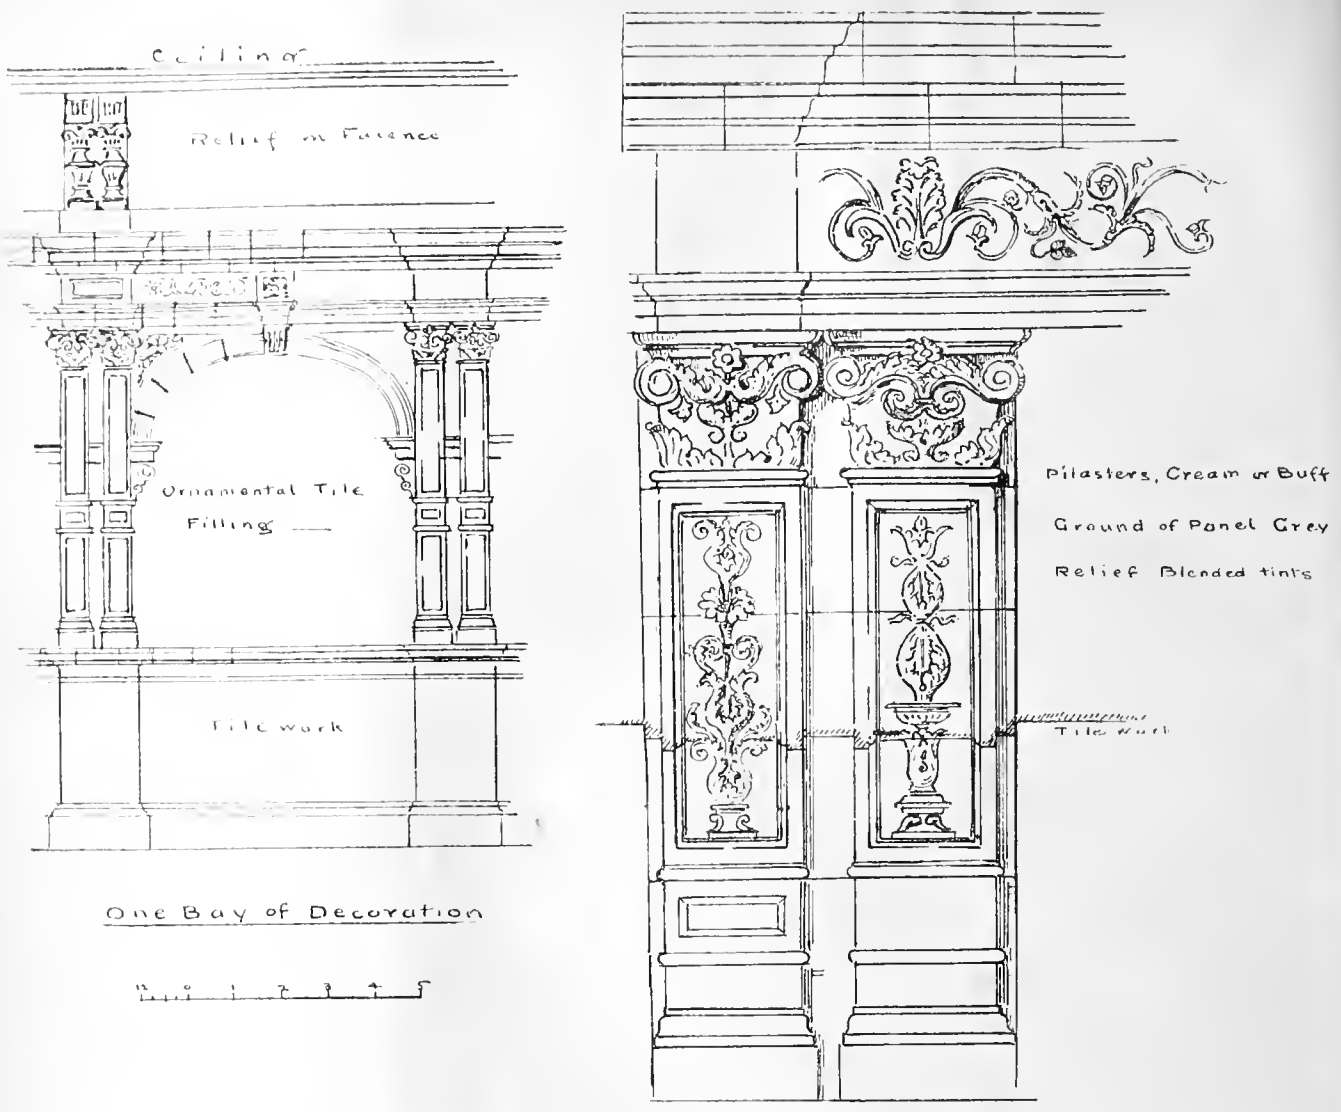
MASON.

WE add to our former notes a few considerations. In specifying mason's work, some acquaintance with the measuring of stonework is essential, and, indeed, up to a certain point, the most efficient specification writer is he who knows how quantities are taken out or work is measured, and for this purpose we recommend the student to consult the admirable works of Mr. John Leaning, Professor Banister Fletcher, and others. The methods of measuring stonework vary. That usually adopted in London is to take out all the labours upon it—a practice that has much to commend it, but which does not appear to be taken advantage of by builders in making their estimates. By others, labour on beds and joints are omitted, and the stone is described as including "all plain beds and joints and preliminary faces," the other labours being added. Mr. Leaning says a reasonable average of beds and joints to each cubic foot of stone is, in Classic and Renaissance work, 1½ superficial feet, in Gothic work 2 superficial feet. The specifier of mason's work should be able to describe the labours on the stone—how it is to be worked, so that the quantities may be correctly taken. A good practice is to give sketches of special features and details of stonework or the more ornamental parts, by which the builder can see the kind of labour which each includes, and this plan, we believe, assists the estimator more than the ordinary descriptive clauses do. Thus in sunk work or moulded work it is necessary to give a sketch to show the face or girth of mouldings sunk; a capital or base, panels, corbels, finials, bosses, &c., are better described by sketches.

In specifying ashlar work, the average thickness and height of the stones ought to be described; as, for example, the alternate courses to be 9in. and 4½in. on bed and 12in. high; also the average length of bond-stones, their width and height, and how often they are to occur to the superficial yard, the finished face of stone, whether tooled, rubbed, or dragged, and if there are any cuttings, fitting to dressings, mortises, dowels, &c.

We have given sketches of several kinds of joints. Grooved and tongued or joggle joints are used for jointing landings. The joggle

FAIENCE DECORATION



joint worked in the solid stone, *b*, p. 697, is not so strong as the metal tongue. Those we illustrate herewith show other forms of cramps or dowels. A cramp of copper or bronze run in with lead or sulphur into a groove worked on adjoining ends of the stones is shown at *a*; another form dovetailed is let into a corresponding groove, it may be of slate or metal. In jointing stones like cornices, curbs, arch-stones, and the like, cement or lead plugs, *c*, are used, grooves being cut at the ends of the two stones with dovetailed holes, into which the lead is run. In the construction of stone lintels or architraves, it is usual to make the centre stone a kind of "key" with concealed joints (see Fig. 10, p. 697). The joints are formed as shown, by two radiating joggles with corresponding indents, or recesses, the joggles being made in the keystone. By this means the outside vertical joints are preserved. Our sketch *d* shows how this is formed in a lintel.

There are many varieties of rubble walling. We illustrate rubble ashlar, *e*, or a rubble wall faced with ashlar; ashlar with brick backing, *f*; and then we have uncoursed random rubble, *g*, where the stones are irregular in size and shape just as they come from the quarry, and rough on the face. In a stone district where only hard stones are obtainable this kind of wall is used. It should be built quite one half thicker than the usual brick wall. In the next class of rubble work, called "coursed random rubble," the stones are irregular in size and shape, but are built in courses roughly formed. "Irregular coursed rubble," *i*, describes stones irregular in size and rough-faced, two or three deep, set in courses, or of the whole depth between two courses. There is also "regular coursed rubble," a wall with roughly faced stones laid in courses of varying height, roughly squared and of different lengths, each course being on one level—a sort of rough "random ashlar." "Kentish rag" walling is built in one of these modes. The joints are important. They may be in lime, stone-dust (or white-lead) putty ⅜in. from face, for ashlar work, or be raked out and pointed with cement or lime mortar, or blue ash, and tuck-pointed in lime, or tuck-pointed in cement, as in Kentish-rag work and other rubble walls.

Certain hard stones are used for thresholds, copings, sills, pavings, steps, templates, &c. "Hard York" is the most used for these purposes. For a superior class of work "Robin Hood York" may be used, or Portland stone.

(Previous sketches for terracotta work, with a slight diversity in jointing, will illustrate stonework. Our sketch to-day is for faïence decoration. The clauses for terracotta are suitable. Doulton's, Lambeth; or Burmantofts, Leeds; Minton, Hollins and Co.; Edwards, Ruabon, are manufacturers of faïence decoration.)

Having described ashlar facing, on p. 698, we append clauses for rubble walling. State the quarry required, how the stones are to be laid, height of courses, whether in mortar or cement, bond-stones to every yard square, and footings.

7. *Uncoursed Random Rubble.*—The stones to be from —— quarry free from sand or clay holes, irregular in shape, and as found in the quarry, or hammer-dressed, laid in mortar, the joints raked out and pointed with blue ash mortar. A through-stone to every yard superficial. The quoins to have a rock or hammer-dressed face, with a chiselled draft on each return of angle. Or—

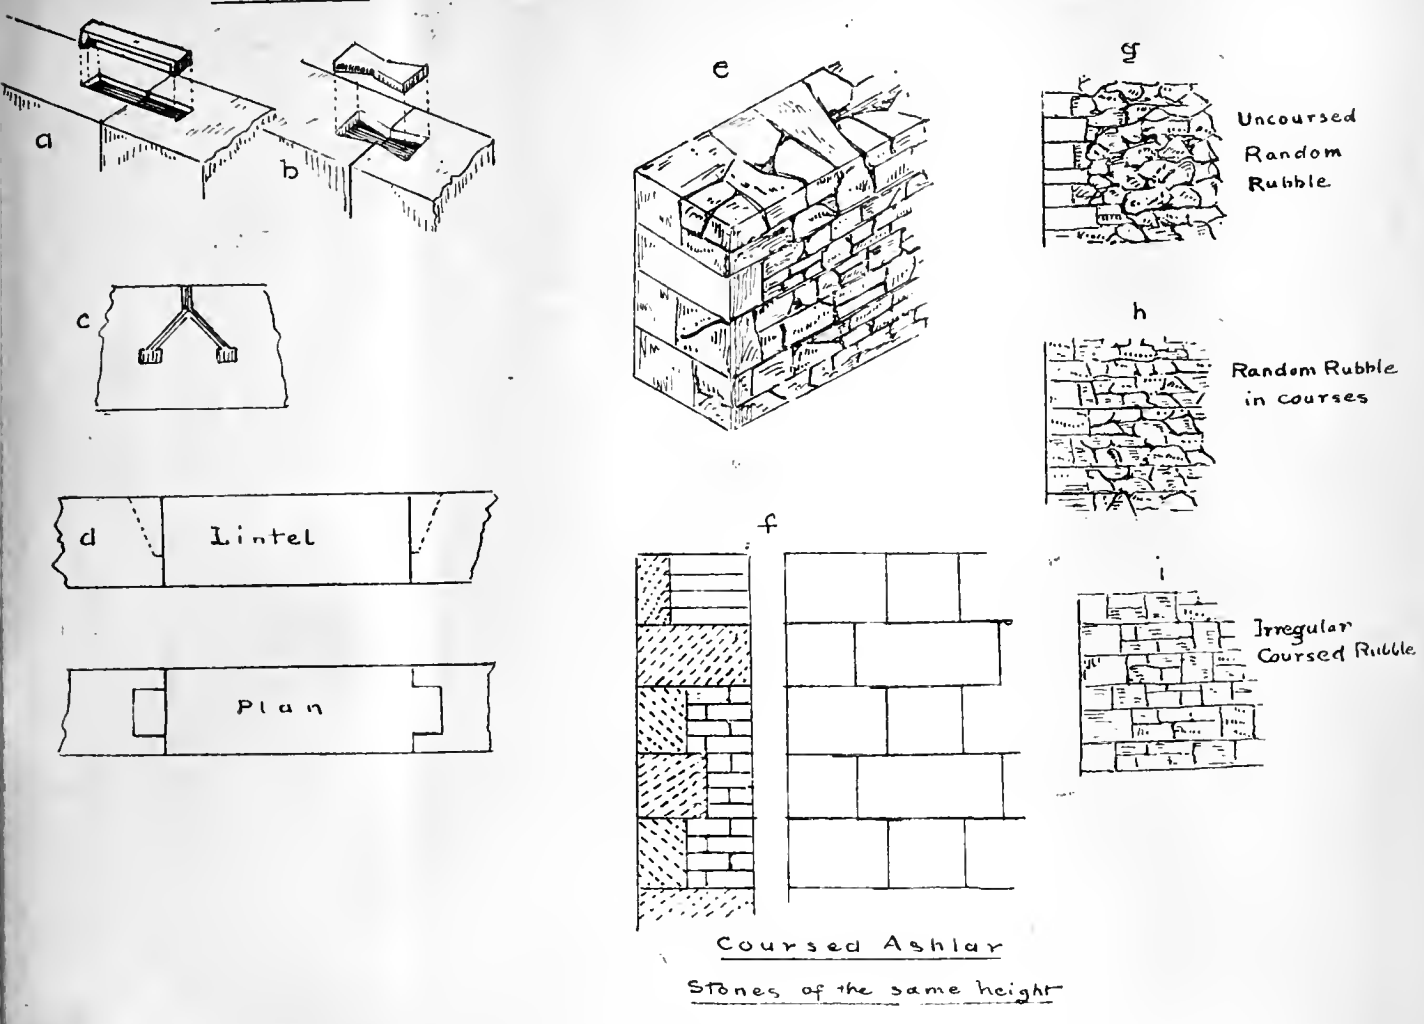
8. *Coursed Rubble.*—The stones to be from —— quarry, free from sand or clay-holes, and irregular in shape, roughly dressed on face, built in rough courses 12in. (or 15in.) high. The quoins to be hammer-dressed, with a chiselled draft at the return sides of angle. The courses to be laid in mortar, raked out and pointed with blue-ash mortar, or tuck pointed in cement. The bond-stones not less than 12in. by 8in. on face, to be built in every superficial yard. The footings to be 12in. high, projecting 3in. on each side, and to be formed of all through-stones. Or—

9. *Random Coursed Facing.*—The exterior of walls to be finished in random coursed work, the stones hammer-dressed to a fair surface, with neat joint, and well pointed. Proper headers and bond-stones to be inserted every alternate course, and the work to be grouted with hot lime and sand every two courses. The stones to be bedded as found in the quarry. Or—

The stone to be Kentish rag (or other local stone of hard quality), and the walls are to be built with random coursed rubble, hammer-dressed, from 4in. to 8in. deep, with a through-stone to every superficial yard, laid in mortar, raked out, and pointed with blue-ash mortar.

10. *Regular Coursed Facing.*—The exterior walls above ground to be faced in neat and regular coursed work; no course to be more than 9in. nor less than 6in. high, hammer-dressed on face, the joints to be close and true, and pointed with lime mortar (or Aberthaw mortar).

11. *Coursed Ashlar.*—The exterior walls (or front) to be faced with neatly trimmed rubbed ashlar of Portland (or Corsehill, or Box Ground stone) in courses of equal (or varying height), not more than 15in., nor less than 9in. The vertical joints to be tooled, and the horizontal joints bevelled 1in. deep, so as to throw off the water, and pointed with cement mortar.



The following items are of general application, and hard Yorkshire, "Robin Hood," Scotgate Ash, and other hard stone is used, though for a superior class of work, Portland stone from the "Whit-bed" series may be specified.

12. *Corbelling.*—Supply where required 3in. (or 4in.) hard, tooled York stones, to carry oriels, chimney-breasts, and angle fireplaces, and other projecting structures. The stones to be in layers or corbelled out where required to support heavy structures, and well pinned into wall with slate in cement. The projecting oriels to be carried on 4in. hard York landing (state size) in one or more pieces, cut and pinned into wall in cement (or tailed under an iron joist if there is little weight of brickwork over.)

13. *Templates.*—All iron girders, tie-beams, iron joists to concrete floors to be laid on hard York tooled templates, 3in. (or 4in.) thick in cement. The seating for girders, &c., to be 4lb. lead or asphaltic felt.

14. *Cover Stones.*—Over the iron girder or timber beams carrying walls hard 3in. York stones to be placed, of the full thickness, and of a length not less than 4ft.; the joints to be cramped with copper cramps. On the upper flange of riveted girders a layer of cement is to be put before the stones are imbedded, to give a flat bed above the rivet-heads.

15. *Thresholds.*—To all outside doorways put 3in. tooled (or rubbed) hard York thresholds, back jointed, and 1½ wider than wall, mortised for dowels or stubs of door-frame. These thresholds to be kept an inch or 1½in. above the floor. Or—

Put to all external doors 6in. rubbed Portland stone (Robin Hood or Caithness stone) steps, weathered, and back jointed, mortised for dowels, and fixed 1½in. higher than the floor level.

16. *Bases for Iron Columns.*—Put hard York (Scotgate Ash) tooled (or rubbed) stone bases (specify size and height) under all the iron columns. The bed to be tooled even and true, and set in cement on the concrete footing. (Sometimes four bolts to hold down base-plate of iron column are used, in which case, holes of 1in. or 1¼in. must be drilled.) Put a Yorkshire (or Portland) stone base tooled (or rubbed) to every column (specifying size), with mortises for stubs. Or—

Put to door-frames hard tooled York stone bases, 12in. deep and 1¼in. wider each way than the frame, chamfered at top all round, and mortised for dowels.

17. *Steps.*—Put to all external doors 3in. or 6in. tooled (or rubbed) York (or Portland) stone, weathered and back-jointed York steps 1½in. wider than the thickness of walls, and kept 1½in. above floor level, mortised for dowels. Or—

Put to all openings where tile paving is used 9in. by 3in. rubbed Yorkshire (or Portland stone) thresholds equal to thickness of walls.

18. *Curbs.*—The area walls to be coped with 9in. by 6in. tooled (or rubbed) hard York stone, chamfered on top edges (or rounded), with slate or copper dowels, the ends built into walls 6in., bedded and jointed in cement. Mortise top for iron railing with York spurs every 8ft. (or 10ft.) apart, projecting 12in. The spurs to be placed on York corbels built into wall. Double tile creasing or slate weatherings in cement, to be fixed under curb to throw off water from face of wall.

19. *Hearths.*—Put to all fireplace openings 2in. or 2½in. rubbed York stone hearths, back-jointed and cut for chimneypiece. The front hearth to be 18in. in width, and 18in. longer than opening; the hearths to be bedded on cement concrete. Or—

Put to all fireplace openings 2½in. rubbed Portland stone hearths (where coloured blue on plan) set in cement, each hearth to be back-jointed and notched for chimneypiece, and to be 18in. longer than the opening. The kitchen fireplace to have a 2½in. rubbed Yorkshire stone hearth, 2ft. wide, and 18in. longer than chimney opening, well bedded in cement concrete.

20. *Paving.*—Pave the area with 2in. tooled York paving, bedded and jointed in mortar in straight courses breaking joint. Or—

Pave the kitchen, scullery, and basement with 2½ (or 3in.) tooled or rubbed York stone, laid in parallel courses, bedded in mortar on concrete (or brick sleeper walls), pointed in cement.

CHEAP PAINTS AND PIGMENTS.—II.

(*Concluded from p. 510.*)

CHROME-GREENS—such as are used in house-painting—consist of mixtures of chrome yellows and Prussian blues in varying proportions. Such greens are usually sold under the name of Brunswick green. Originally, however, Brunswick green was obtained from salts of copper; but very little of that original pigment is made and sold now, as similar tones of colour can be obtained at a much cheaper rate by means of mixtures of blue and yellow pigments. Such mixture is made in two ways—either by mixing the dry pigments together in powder, or else by simultaneously precipitating the yellow and blue pigments. By the latter method a much better and more uniform admixture of the yellow and blue particles is produced than by mixing the dry powder colours. The process by mixture in the dry way is to sift blue and yellow pigments together several times through a sieve, and then put the mixture under an edge-runner mill. Any adulterating body—such as barytes, chalk, kaolin, &c.—is mixed in with the yellow and blue pigments at the time of sifting. It is conceivable that by this method it is not always possible to intimately mix every particle, no matter how long the mixing process may occupy. There is one advantage in this method over the wet process—namely, that when the mixing is done the compound is ready for use in grinding up in oil, whereas in the wet method the compound pigment has to be washed and dried and then ground in the dry state before being able to be mixed with the oil. By the wet method the green pigment is produced thus:—Two wooden tubs or vats stand on a shelf, each fitted with a tap that permits the fluid contents of each vat to flow into a larger one standing below the shelf. Into these vats are put a solution of bichromate or chromate of potash or soda (according to the tone of green to be produced), and a solution of ferro-cyanide of potassium (yellow prussiate), each solution

having been made in a separate vessel, and strained or filtered before putting it into the vessel standing on the shelf. In the large vat that stands below those two vessels is put solutions of lead and iron salts, together with any white body that is to be admixed for the express purpose of increasing the weight, bulk, or rendering the tone of colour light. The contents of this large vat are kept continually stirred while the taps of the vessels standing on the shelf are opened to allow of the fluid contents to be discharged into the larger vat below; then the solution of bichromate of potash, &c., when it comes in contact with the solution of lead salt in the vat below (which is either a solution of acetate or nitrate of lead) will produce yellow chromate of lead; similarly, when the solution of yellow prussiate comes in contact with the solution of iron salt that is in the large vat (usually a solution of sulphate, but sometimes one of nitrate of iron) there will be a production of Prussian blue; consequently, as the yellow and blue pigments are produced simultaneously, their particles will be most intimately commingled, as likewise will the solid white particles of the adulterating body (barytes, gypsum, kaolin, &c. that is being stirred up in the large vat. When the whole of the solutions are mixed together in the large vat, the contents of the latter are allowed to settle, the supernatant liquor drawn off, and fresh water run in, the contents stirred up and again allowed to settle, when that wash water is drawn off and a fresh quantity added, and the stirring and settling repeated *de novo* until the pigment is sufficiently washed free of soluble salt. The pulpy mass of green pigment is then taken out and dried by one of the usual methods adopted for drying pigment.

There are many formulæ as regards the respective quantities of each particular ingredient to use, each colour-maker adopting his own. It will be seen from this method of mixing that the amount and nature of the adulterant mixed with the green can be also varied at the will of the maker. If sulphate of iron be the iron salt that is used, Prussian blue itself will not be at once formed on the mixing therewith of the yellow prussiate, but a whitish, greenish mass, which by means of a supply of oxygen is converted into the deep blue pigment. This greenish-white mass is oxidised either by exposing it to the air for some time with frequent stirring—a long and tedious process—or else by the addition of some oxidising agent, such as sulphuric or hydrochloric acid, the nature of this oxidising agent being determined according to the other ingredients that have been used. To produce a bright colour, it is necessary to preserve the contents of the large receiving vat of an acid nature, for if allowed to become alkaline, such alkalinity will affect the brightness of the yellow chromate of lead by changing it more or less to a brown. It is usual to add a little sulphuric acid to the solution of yellow prussiate in a small vessel. In the case of using nitrate of lead and other *per*-salts of iron, the deep blue coloured pigment is produced at once on such solution coming in contact with the yellow prussiate. Of course, there are various modifications of the above process, but that given is a general outline sufficient for the reader to form an accurate idea of how Brunswick or chrome-green pigments are made, and in what way adulterated.

The true chrome-greens—*i.e.*, those which are obtained from chromium and chromium salts—are usually produced by fusing the components in crucibles in the heart of a reverberatory furnace; but as these green colours are limited in tone, expensive, and, therefore, very little used in house-painting, further mention of them is unnecessary.

Under various fanciful names, however, there are a lot of greens sold. Thus, *Brighton Green* is a compound obtained by compounding solutions of sulphate of copper and sugar of lead with water in which whiting is stirred up.

Bremen Green is made on the same principle as blue verdite. It is essentially a copper green.

Cobalt Green, sometimes called zinc green, is obtained by the calcination of a mixture of oxide of zinc and cobalt. This green is a very pale light green, something like emerald green in tone, but more bluish. It is a more permanent green than emerald green, but its price renders it unfit for general use in common painting, particularly so as its tone and colour can be well imitated by emerald green, blue and white pigments.

Douglas Green is a pigment obtained from the decomposition of chromate of barium. The green is a very pale, light green, and not very satisfactory in colour or working qualities.

Emerald Green is a compound of copper and arsenic salts. All pigments obtained from copper or arsenic salts are liable to darken in time, and suffer decomposition by sulphur and mixture with other pigments. Emerald green is such a light, pale green of a pure green tint that it cannot be imitated by mixture of yellow or blue pigments. It is very different in body or opacity, and works granular under the brush. Owing to the volatility of arsenic under alternations of temperature, the poisonous component becomes partially separated, and, mixing with the air of the apartment, sets up blood-poisoning in all persons inhabiting such rooms. On this account emerald green has long been condemned as a painter's colour. If it be ground up in a varnish vehicle, however, such poisonous emanations would not take place, and consequently it could be safely used. Paris green is only another name for a pigment similar to emerald green.

Manganese Green is more of a chemical curiosity than a commercial pigment; but it is a good, permanent green, and worthy of attention on the part of colour-makers. It is obtained by calcination of manganese and barium salts.

Mitis Green is a pigment possessing a copper and arsenic base.

Mountain Green is a pigment consisting essentially of copper, carbonate soda, produced artificially or obtained as a natural earth.

Prussian Green is a name now superseded by Brunswick green.

Scheele's Green is a pigment similar to emerald green, being a compound of copper and arsenic.

Schweinfurth's Green is a ditto green to the last above mentioned.

Terra Verte is a native green, largely consisting of silicate and phosphate of one of the lower oxides of iron.

Verdigris is a pigment consisting of a copper base, and, therefore, not of great value as a painter's colour.

Vienna Green is another name for emerald green.

Viridian Green or Veronese Green is a transparent green produced from salts of chromium by elaborate and tedious processes, and therefore very useful in fine-art painting.

Zinc Green is another name for cobalt green, being obtained from salt of zinc and cobalt. This green is sometimes called lime green, because it can be mixed with lime as a distemper colour; whereas Brunswick green and stone green, consisting of yellow chromate of lead and Prussian blue, cannot be so used, as the alkalinity of the lime turns the green pigment more or less brown.

Vermilion is a pigment that is unlike any other colour in brightness of hue, except red-lead. The latter pigment, however, is a very inferior colour. The two pigments are very different in composition and physical qualities; red-lead being an oxide of lead, and vermilion being a sulphide of mercury; both pigments are very heavy and dense, but red-lead is of a granular structure, whereas vermilion is an amorphous powder. Genuine vermilion is produced by calcining sulphur and mercury together in suitably-shaped crucibles for many hours; the components combine, and form a black sulphide of mercury, which, on further heating, is changed to a red colour, and sublimes on the uppermost parts and cover of the crucibles. When the heating process is complete, the crucibles are removed from the furnace, broken up, all black portions, if any, are separated from the red vermilion, and the latter is then washed and dried for use as a pigment. The black sulphide that remained is dried in a second calcination, so as to convert it into the red variety. Great skill and care is needed to produce successful results, and the product is necessarily costly, because mercury is scarce. Now the unskilful maker of vermilion will leave too much free (i.e., uncombined) sulphur in the product, which will cause many disastrous results when some is mixed with other pigments. All attempts to imitate vermilion have failed, the nearest approach that has been obtained is in the production of vermilionettes. These pigments consist of red-lead, on which is precipitated an aniline dye—eosine—so as to give the scarlet red colour to the pigment. Another near approach to vermilion is obtained by boiling white-lead in a solution of bichromate of potash. The resulting pigment is of a bright scarlet hue and very heavy; but neither of these two imitations equal the genuine article in qualities. Of the two imitations, the latter is to be preferred, because red-lead that is coloured with eosine will quickly fade when exposed to light. Owing to the cost of genuine vermilion, this pigment is seldom free from adulteration, the usual adulterant being either red-lead or chrome-red, as the second of the above facititious vermilions is usually called, any deficiency of hue being rectified by means of aniline red dyes. Orange mineral or orange chromate of lead is also frequently used as an adulterant; but it makes but a poor substitute, as it is a very crystalline pigment.

Crimson and other Lakes consist of alum or some other semi-crystalline body tinctured with solutions of cochineal (an insect) or of madder (a plant). The colouring matter of the cochineal insect and of the madder plant (the roots are the portion used) yield very richly coloured fluids, which, however, are destitute of sufficient solid matter to be used as pigment; therefore this colouring matter is precipitated in, and intimately mixed with, some inert body such as sulphate of aluminum or barytes (in common lakes, chalk is the base that is coloured with the red colouring matter). These inert bases are destitute of covering power or opacity, and, therefore, all lakes are transparent, consequently their use is limited, being useful only as a glazing colour over some opaque ground. A glaze of crimson lake over vermilion gives a very rich red. The finer quality lakes require great care and nicety of proportion of the ingredients for successful production; but common house-painters' lakes are very easily made. Painters will find it pay them best to use only the genuine lakes for decorative work.

Indian Red is an oxide of iron similar to Venetian red, but of a purplish hue. This colour is frequently adulterated with cheap red oxides, and to tone down the brightness of same a little lampblack is added. Of the brown pigments, most of them are found as native earths. Thus umbers are compounds of iron and manganese; siennas are earth compounds of oxides of iron and silica; so likewise are ochres, yellow and red, the tone of colour being dependent on the exact nature of the iron oxides. Some of these earths are so pure that they are ready for use without any preparation; but most of them require washing. This is particularly so with the French yellow ochres. These earths, as they are mined, are put into a series of tanks of water, and stirred up thin, and by a system of gradation the coarser particles are separated from the finer, and thus several brands—usually three—of the ochre are obtained. Some of the earths are calcined, such, for instance, as the umbers and siennas, by which means a change of hue results. Thus we have raw and burnt umber, raw and burnt sienna, and by this calcination the oxide of iron component becomes redder, and so produces this change of hue.

Vandyke Brown is a native earth. Many of the ochres are imitated by artificially calcining the raw materials so as to produce yellow and brown of various tones. These colours are generally known as "Mars" colours, such as Mars orange, Mars yellow, &c.

Prussian Brown is a soft, unctuous brown pigment of a snuff-brown hue. The brown pigment is not used so much as it merits. It is produced by colouring Prussian blue, but it can be produced in a much more economical manner, thus:—Mix any solution containing iron salts with a solution of barium nitrate or chloride (or even with solid barium sulphate), and then add a solution of yellow prussiate of potash. Collect the precipitate, and calcine it in enamelled iron dishes, when a good brown pigment is obtained. A much superior brown pigment has been obtained by the writer from the waste waters used in washing red oxides of iron by a method somewhat akin to the above.

Asphaltum Brown is a native pitch or bitumen, which softens under heat, and, therefore, paint made from such a material never rests safe and sound under the sun's rays. The writer, however, has perfected a substitute for this treacherous brown pigment from mineral ingredients alone. Owing to the cheapness of these earthy colours they are not usually adulterated. Nevertheless, the painter is often served with inferior pigment, as for instance, being supplied with a native earthy colour that has not been freed from extraneous earthy matters or gangue.

Of the black colours, the only pigment in use by painters are lampblack or carbon blacks. There are several mineral blacks, such as black oxide of copper, black oxide of manganese, &c.,

but they are not of a suitable nature to be used in pigments. The only mineral black that is fitted for use as a paint is the black oxide of cobalt, but the price of this oxide, which is over 10s. per pound, puts its use entirely out of the question by painters.

Lampblack formerly, and to some extent at the present time, is the sooty matter collected from burning oils and other fatty bodies rich in carbon. Blacks that are of a kindred nature are the carbon blacks that are so largely produced in America. Of these American blacks, one of the best is that put on the English market by Messrs. Binney and Smith, of New York; the London agency is at 63, Farringdon-street, E.C. Samples of these blacks examined by the writer show a wonderful depth of colour, softness, and good capacity for mixing with oil vehicles. Inferior-made lampblacks contain much tarry matters, which retard the drying of the paint when such blacks are ground up in oil, while badly-made lampblacks are not of a rich, deep, velvety blackness, but inclined to brown. H. C. S.

THE ARCHITECTURAL ASSOCIATION.

THE concluding meeting for the present session of the Association was held at 9, Conduit-street, W., on Friday evening, the president, Mr. Hampden W. Pratt, F.R.I.B.A., in the chair. The following architects were elected as members:—E. E. B. Claypole, W. H. Hobday, S. Sanders, and W. H. Ansell. Messrs. G. Vernon, of Harrow, and M. Zimmermann, of Rood-lane, E.C., were re-elected as members, and Mr. Edwin T. Hall, F.R.I.B.A., of Moorgate-street, E.C., was elected, by acclamation, on the proposition of the PRESIDENT. Mr. G. B. Carvill, hon. secretary, proposed a vote of thanks to Mr. Ernest Runtz for allowing members to visit the Crown Theatre, Peckham-road; and also to Mr. J. Dixon Butler for allowing members to visit the new police station at Camberwell, both on May 7th. Mr. Carvill added that on the following afternoon (Saturday last) a visit had been arranged to be made to the Grove Fever Hospital, Tooting, but two or three minutes ago a representative of the architect, Mr. A. Heasle Tiltman (who had promised to conduct the party over the buildings) had brought a telegram from Messrs. Kirk and Randall, the contractors, refusing to allow any members of the association to visit the works. Messrs. Kirk and Randall gave no reason for the prohibition, but threatened to bar the doors against any visitors who might come. Under these circumstances, the inspection of the building must be postponed.

THE A.A. TRAVELLING STUDENTSHIP.

The PRESIDENT announced that for the Association Travelling Studentship three sets of drawings had been sent in, and had been hung on screens in the room. The Prizes Sub-Committee had recommended that the studentship be awarded to H. F. Waring, 10, Priory-road, Bedford Park, Chiswick, and that recommendation had been adopted by the Committee.

FOUNDATIONS FOR LONDON AND RIVERSIDE BUILDINGS.

An exhaustive paper on this subject was read by Mr. ARTHUR T. WALMISLEY, M.Inst.C.E., and will be found *in extenso* on p. 739. The lecture was illustrated by numerous plans and diagrams.

Mr. MATT GARBUTT, in proposing a vote of thanks to Mr. Walmisley, remarked that this was one of the fullest papers ever read in that room. The subject of foundations was of special interest just now, for attention was being called to the mechanical and constructive side of an architect's work by a recent disastrous failure, and he feared more accidents of the same class might be expected in the near future. Architects desired, however, not so much particulars of foundations for extensive warehouses, but figures to guide them in constructing small houses of moderate rental on the London clay. He believed they ought not to go beyond a load of two tons per square foot on such a soil; in factory chimneys, exerting a pressure not exceeding 2½ tons per square foot, settlements had occurred. In London they had a code of regulations as to the thicknesses and height of chimneys, and if these were complied with a safe job would result. It was a mistake to carry the inside lining of a tall chimney up to the capital; in one case within his knowledge where this was done the expansion of the lining under the fierce heat generated below cracked the outer shell, and these fissures spread during gales; the upper part of the lining was cut out and the cracks did not extend.

Mr. J. H. SHAW seconded the vote of thanks, and asked if water could be effectually kept out of foundations by the use of a raft of concrete, without the addition of a layer of asphalte—an item which added considerably to the expense. If so, what thickness of concrete was necessary to prevent the water from rising? For piling he found English larch cheaper, and, he thought, more durable than pitch-pine. The plan of floating buildings on a concrete raft was very well if the walls were well balanced; but, if one side was very much heavier than the opposite one, there was an obvious risk that the building would settle on that side. To prevent this danger of tilting, concrete piers or legs should be sunk to a good foundation beneath the concrete table.

Mr. BERESFORD PITE asked Mr. Walmisley what was the most economical foundation for a two-story on a weak soil in the country. In one case where he was excavating a sub-basement, he had first to underpin and line the neighbour's party-wall. He employed a good builder, who made a satisfactory job of it with slate and cement; but other builders had said that such a job could not be made good. Should the abutting walls of towers be provided with a groove to prevent unequal settlement? If a concrete table was provided under the entire foundation, he could not see why the builder need excavate for legs, for he might simply put in a solid bed of concrete, say from 3ft. to 6ft. thickness, at the required depth. The imperviousness of concrete largely depended on its quality.

Mr. H. H. STATHAM pointed out that there was a risk that a concrete raft might tilt bodily, as Mr. Shaw had suggested, and, therefore, in doubtful soils piers should be carried down in places. The difficulties and great expense of the foundations for the Church of the Sacred Heart on the hill of Montmartre at Paris suggested the necessity for testing the nature of the subsoil before work was commenced.

Mr. E. GREENOP remarked that he adopted in building a house on made soil and refuse the method of rolling the ground, and then laying a layer of 18in. of hard core, on which a raft of concrete was set, and this proved satisfactory. Peat was a very treacherous foundation, from its greasy character. While carrying out work at Smithfield he came across one of the original plague pits, including some skeletons, but he buried it beneath a thick layer of concrete. Where money was a consideration, he enveloped in the concrete cross layers of worn-out tramway rails, which could be purchased very reasonably, and distributed the weight well.

Mr. EDMUND OLANDER, M.Inst.C.E., of the Great Western Railway engineer's office, said, about 33 years ago he had some puzzling collapses in a viaduct on the Metropolitan extension of the London, Chatham, and Dover Railway. The contractors, Messrs. Peto and Betts rebuilt the viaduct as quickly as possible, and then found that the failures were due to the fact that the blue clay on which the piers rested had a water seal nearly parallel with the rails, and that under the weight the bed had shifted. Unless means were taken to get reliable borings before inviting tenders for bridges over rivers the estimates would be greatly increased. Instead of providing holding-down holes in columns built on concrete, it was often possible to secure the columns from being moved by providing broad flanges at the bases, and filling in the concrete round the feet.

Mr. ARTHUR S. FLOWER remarked that when carrying out work in Tottenham-court-road, the contractor sent to him in great alarm stating that his men had come upon a plague pit. He secured some of the bones and sent them to the Natural History Museum, South Kensington, where they were at once pronounced to be those of oxen. The site, it proved, had previously been that of a large slaughterhouse. In another case, it was alleged that a large spring had been tapped during excavation, but investigation showed the influx of water to be only the leakage of a broken supply pipe next door.

The PRESIDENT, in putting the vote of thanks, said he would have liked Mr. Walmisley to have dealt more fully with the shrinkage of clay under London suburban houses, and to have told them how to deal economically with it. The modern treatment of riverside sites by laying iron grid iron foundations was a great advance on the old pile system, and had to a great extent replaced it.

Mr. WALMISLEY, in replying, observed that a great deal of the success of concrete foundations depended on the quality of material employed. He preferred pitch-pine to larch for piles, as it could be employed in long lengths and square sections. For small buildings slate and cement might be sufficient for a damp-proof course; but for large works asphalte was essential. In building high towers it was advisable to provide a straight joint at intervals, so that in case of a settlement on one side the cracks would not extend. The construction of legs under concrete rafts were intended to prevent bodily movement in the table under the points where the principal weights came.

ELECTION OF OFFICERS AND COMMITTEE.

The President read the report by the scrutineers on the voting for the election of officers and committee for the session 1898-99, as follows:—President, G. H. Fellowes-Prynne; Vice-presidents: P. J. Marvin and A. S. Flower; Committee: T. W. Aldwinckle, jun., R. S. Balfour, H. B. Creswell, B. Flight Fletcher†, Matt. Garbutt*, A. H. Hart†, Beresford Pite, W. A. Pite*, H. A. Satchell*, and W. Howard Seth-Smith; Hon. Treasurer: Hampden W. Pratt; Hon. Librarian: C. M. Freeman; Hon. Secretaries: E. Howley Sim and G. C. Carvill. Other officers—Hon. Solicitor: W. H. Jamieson; Hon. Assistant Librarian: E. W. M. Wonnacott; Hon. Auditors: H. P. G. Maule and J. W. Stonhold; Assistant Secretary and Registrar: D. G. Driver. (An asterisk [*] indicates new members of committee; a dagger [†], vice-presidents of last session.) The report, which was signed by Messrs. E. Greenop, W. W. Biss, A. Smithers, G. H. Jenkins, and C. H. Brodie, stated that 292 voting-papers were returned, of which seven were rejected for various reasons, leaving 285 valid ones.

VOTES OF THANKS.

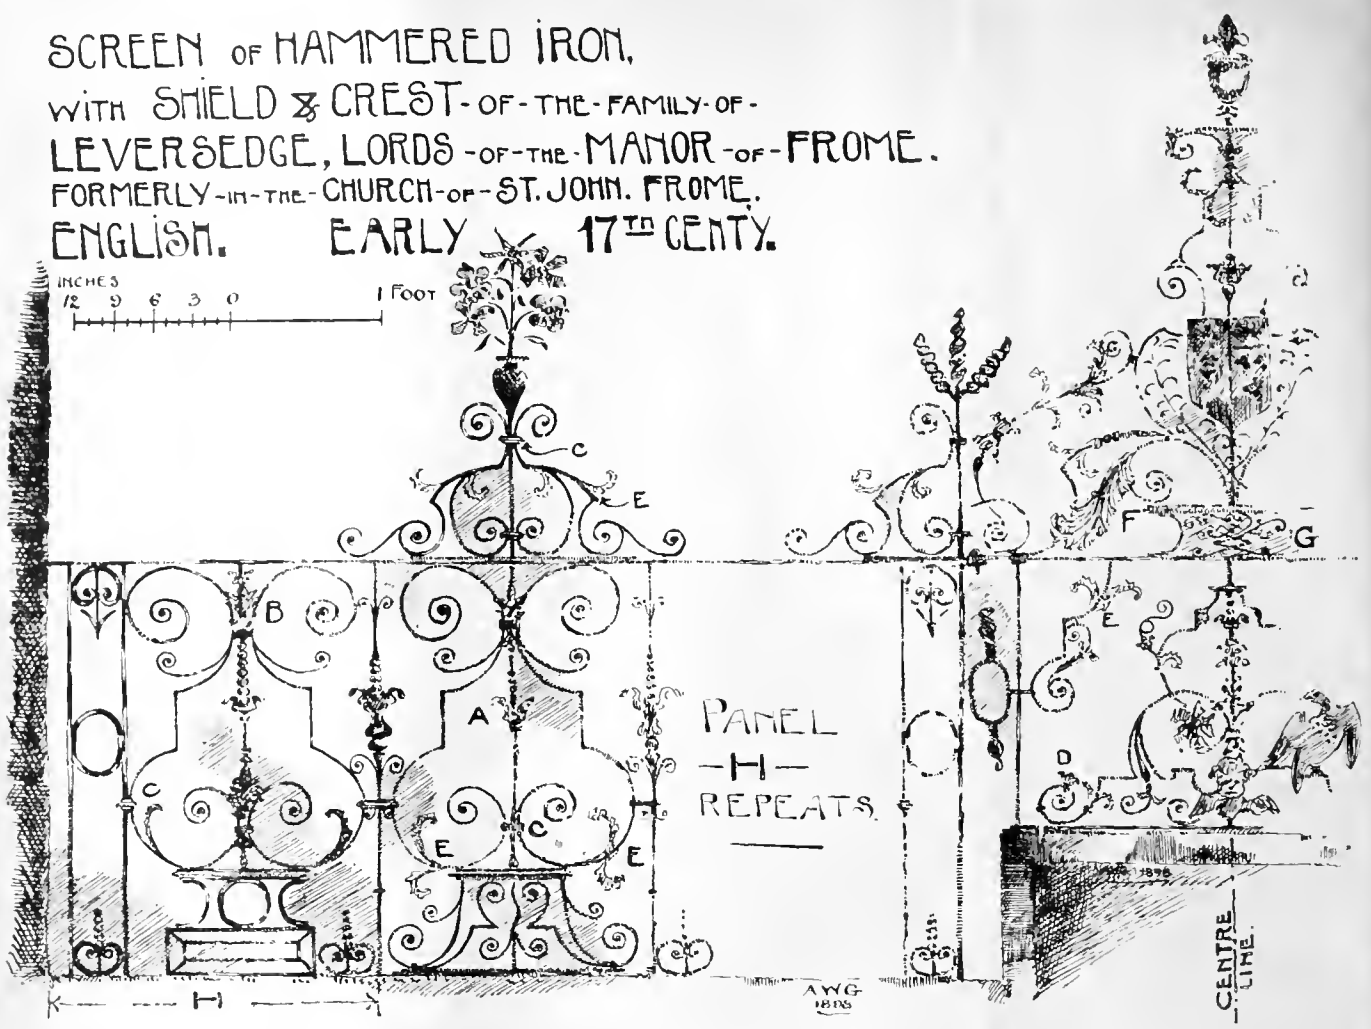
Mr. BERESFORD PITE, ex-president, proposed a vote of thanks to the out-going president. Mr. Pratt, he said, had proved an excellent and hard-working president, had visited all the classes, and given much time to the sub-committees, and had raised the association to a more flourishing condition than it ever previously occupied. The motion was seconded by Mr. G. H. Fellowes-Prynne, president elect, was carried by acclamation, and was briefly acknowledged from the chair.

The retiring members of committee having been thanked on the motion of Messrs. SIM and CARVILL, Mr. F. G. F. HOOPER proposed a vote of thanks to the President for his services as treasurer, remarking that the President had held this office during several stormy years in the history of the Association, and he was glad to think Mr. Pratt was willing to continue his services. Mr. SIM seconded the motion.

On the proposition of Messrs. B. F. FLETCHER and GARBUTT, Messrs. Freeman and Wonnacott received thanks for their services as hon. librarians, mention being made of the assistance given with the lantern by Mr. Wonnacott. A hearty vote of thanks was also accorded to Messrs. Sims and Carvill for their labours as hon. secretaries on the motion of the PRESIDENT, seconded by Mr. BRODIE; and the closing of a long series of acknowledgments of services were those to the Royal Institute of British Architects for the use of the meeting-room at 9, Conduit-street, and to the School of Design, the Visitors, and Technical Education Board for the facilities granted to A.A. students in connection with workshop demonstrations in lead-working, masonry, and stained glass.

AMERICAN AND ENGLISH STEEL CONSTRUCTION.

THE remarks on "American and English Practice in Architectural Steel Construction" in the current number of *The Engineering Magazine*, by Mr. Charles V. Childs, are of some interest. The author compares the London and New York practices in iron and steel construction. We may, no doubt, learn something from our American friends, if we desired to reach the standard they have attained; but, as Mr. Childs says, it is very doubtful if the London County Council will ever permit the "steel-constructed 'skyscraper'" to be erected within its area. He



is quite right. He says truly enough: "It is appalling to think what the streets of London, already in so congested a condition, would be like, were it permissible to erect buildings fifteen or twenty stories high. That we are rather behind the New York practice of steel construction will not be disputed; but the question is whether the English system does not conform itself more to the judgment and taste of architects. The author refers to the number of front walls of London shops that are carried on bressumers resting on exposed cast-iron columns—whereas the New York building laws provide "that all cast-iron columns supporting outside walls shall be incased in an outer cast-iron shell with an intervening air-space." We here quote Mr. Child: "The excessive height of American buildings has necessitated the use of the steel skeleton construction, in order to economise the weight, and consequently the thickness, of the walls in the lower stories, which otherwise would occupy valuable space, to say nothing of the cost of material and labour. The usual thickness of walls which, from the nature of the construction, serve only as a covering, is from 13½in. to 18in. In England, the thickness of wall at the ground-floor level rarely has to exceed 2ft. 3in.; if, however, instead of being five or six stories, the buildings were to be three or four times that height, the increase in thickness would have to be enormous, and the steel skeleton framework would probably come into general use." Mr. Childs points out that, whereas in America each story is entirely supported by girders at the floor level of that story, and the weight directly transmitted to the foundations by means of steel columns (or stanchions), the English practice is to place all necessary bressummers at the level of the first floor: these, therefore, having to carry the whole weight of the building above, are necessarily heavy compound girders. The English practice is undoubtedly inferior in this respect, as he shows by comparing the two methods by photo-blocks of buildings, as the framework of the Hotel Russell, London, with its 15-ton girders, and the American steel frame of the Carnegie Building, Pittsburg, for each of which the author designed the steelwork. We cannot here enter into the subject or compare the details of the two systems which are presented by Mr. Childs; but refer our readers to his paper itself. One of the difficulties of introducing the system adopted in America is said to be that the architect's plans are generally completed before the engineer's work begins. These and other differences of practice are worth attention by the profession, who might adopt with advantage certain principles. To our minds, the English system has its advantages as well as defects. We do not lose the solidity and structural character of brick or masonry building which the New York system does; on the other hand, there is a great deal to say for a system of steel construction which supports each floor independently, instead of resting all the upper stories upon a heavy framework of girders, which have to be enormously heavy and cumbrous.

IRONWORK AT SOUTH KENSINGTON MUSEUM.—III.

By G. A. T. MIDDLETON.

IV.—ENGLISH: THE LEVERSEDGE SCREEN.

THE screen from the church of St. John, Frome, bearing the shield and crest of the family of Leversedge, Lords of the Manor of Frome, dates from the early part of the 17th century, and is a specimen of the light and fanciful Renaissance ironwork frequently employed up to the end of last century. Both bar and rod iron are used in it, but the rod only sparingly, and mainly in the form of wrought balls. The exceedingly graceful and flowing character of the leaf at F, and the monogram at G, are particularly noticeable, as is also the somewhat eccentrically-riveted rosette at D; while many object to the direct copyism of natural forms in iron, as instanced in the flower-pot finials.

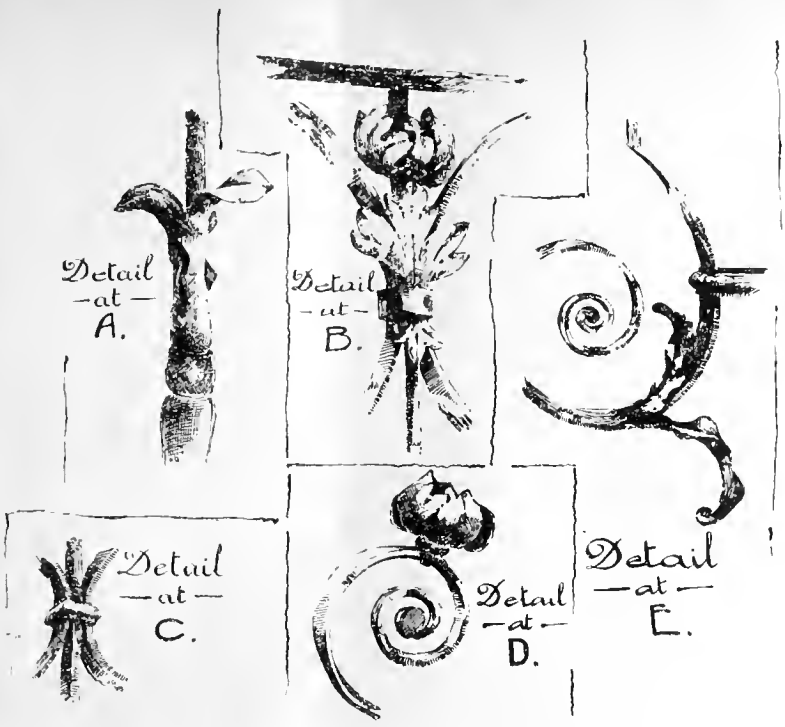
Herr Land, Professor of Architecture at Berlin, is on his way to Palestine, to superintend harbour and road renovations necessary for the journey of the Emperor and Empress to Jerusalem.

CONCRETE SLABS.

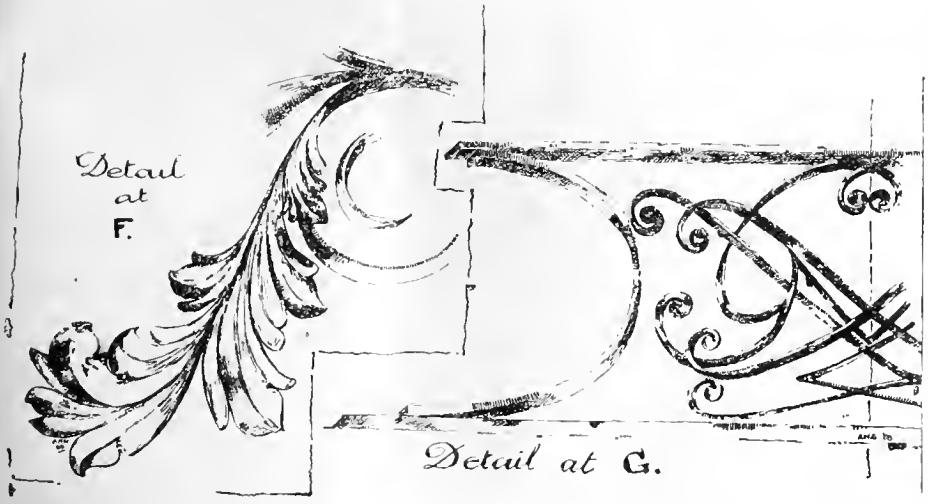
MR. GEORGE HILL'S paper on "Steel Concrete Construction," read before the American Society of Civil Engineers, treats of a series of important tests on slabs of concrete and steel, in which the steel acts entirely in tension in the bottom section. Sixty different samples were tested, using different mixtures of concrete and of varying spans and thicknesses, and those who contemplate using flat slabs of concrete and steel will do well to consult Mr. Hill's table of thicknesses for slabs for live loads from 75lb. to 250lb. per square foot. For a span of 10ft., it appears, a thickness of 5in. is required for a live load of 75lb. per square foot. Hitherto architects and others have been in doubt as to the actual weight that can be borne on concrete slabs. Of course, Mr. Hill's tables are based on the strict observance of conditions as to components and method of mixing and quality of cement, and those who use the results obtained will have to observe that the conditions are the same in each case. A great many useless and unreliable "data" are published on the strength of concrete due to tests not carefully conducted.

THE COLLAPSE OF ABBEY MANSIONS, WESTMINSTER.

AT the Westminster Coroner's Court on Thursday in last week, Mr. Troutbeck, assisted by Mr. John Slater, F.R.I.B.A., as assessor, resumed the inquiry into the circumstances attending the death of the seven men killed in the collapse of the roof of Abbey Mansions, Orchard-street, Westminster, on April 21. Mr. E. Dru Drury, the district surveyor, resumed his evidence. Correcting a statement made on the previous day, he said that the weight of the base of the pier was 66 tons, and not 88 tons. The Coroner said he regarded the building as still in course of construction, and the question as to whether it was exempted from the terms of the Building Act according to section 202 was open for legal decision. It did not seem to him, however, that the action of the district surveyor was closed. The witness said



that, to save any question of the kind arising, and to be on the safe side, he was now going on with his supervision of the building. In reply to Mr. Avory (who appeared for Mr. Pawley, the architect), the witness said the safe weight-bearing limit of the pier was 45 tons, and he estimated that six times that weight, or 270 tons, would crush the pier at its base. No large quantity of soft bricks could have been used without his knowledge. Mr. Avory remarked that the witness Collins had sworn that thousands of soft bricks were used. The coroner said he should tell the jury to disregard Collins's evidence altogether. The witness, continuing, said that centring ought not to be struck until the concrete was dry, but if the concrete was made wet by rain it would be comparatively unimportant. He could not tell from his examination of the fallen pieces of concrete whether the moisture which existed was produced by rain. He did not think that everything that happened would be accounted for by a large lump of concrete falling from the roof and striking one of the girders. His reason for that was that the whole of the pier as well as the 18in. wall was demolished. In his opinion it was the pier that gave way. Either the pier gave way and took down the girder, or the girder fell and knocked down the pier. By Mr. Gardner: If the concrete was not properly mixed, he should have expected to see it fall in small pieces, not, as in this case, in large lumps. The witness, replying to Mr. Kent, said that, taking into consideration the thickness of the concrete, seven days would be the minimum safe time for it to set before the centring was struck. He had previously formed the opinion that the accident was due to the premature striking of the centring on information which he now knew to be incorrect. He thought that the bearing of the carriage girder of the sixth floor was so bad that a comparatively small weight would knock it off. The pier was built in Portland cement. By Mr. Fraser: As district surveyor, he had nothing to do with girders or piers. The plans submitted to him did not show the arrangement of the girders at all. Mr. Ashmead, on behalf of Her Majesty's Office of Works, said he was instructed to deny that any alteration in the height of the building was desired by the commissioners. James Lillywhite, recalled, said on the day preceding the accident he was in the basement of the building, and his mate drew his attention to three cracks in the brickwork of the pier about 4ft. or 5ft. from the ground. The cracks were 7in. or 8in. long. The largest would admit part of a trowel. By Mr. Marshall: He mentioned the matter of the cracks to a member of the jury whom he met outside the Court two days ago. Mr. Marshall said that was most irregular. The Coroner agreed. Mr. C. J. C. Pawley, the architect, recalled, said he believed he was the owner of the freehold as *cestui que trust*, and Mrs. Leeds was his trustee. He might have recommended the building to Mr. Rickard. Witness had nothing to do with arranging the subcontracts; but he directed Banks's fireproof work, and his assistant, Simpson, directed Murrell's work. After a time the plans for the south block were altered, and those produced were prepared by witness. The pier, which was to be 2ft. 3in. by 1ft. 6in., was to run up from the first-floor level to the seventh floor—about 78ft. Provision was made in the basement for a stanchion. Detailed plans were prepared by Andrews, the builder's foreman. The dimensions of the pier being given as 2ft. 3in. by 1ft. 6in. was the result of a draughtsman's error. It was true that the plan was given to the contractor to work from. Witness designed the roof, and he considered himself responsible for the pier. He entered into an agreement to lease the building to H.M. Commissioners of Works a week after Rickard sold his interest to Mrs. Leeds. From that time witness merely acted as architect. The stanchion, though desirable, was not put in because the machinery occupied the space where the footings were to be. There was no room for it. He gave his assistant strict instructions not to allow the centring to be struck, having in his mind the possibility of an accident. He still thought the collapse was due to the falling of the concrete. He did not know the dimensions of the pier as constructed. He did not remember receiving a single complaint from anybody about the construction of the building or the materials. By Mr. Gardiner: He acted on the advice of his solicitor when he decided to have a trustee. He was bankrupt eight years ago, and it was possible that his liabilities exceeded £100,000. It was not a fact that Rickard represented him. The increase in the height of the building was not the outcome of a suggestion from the Commissioners of Works: it was raised to make it uniform with the north block. He was under the impression that his action had the approval of the Commissioners. By the Coroner: He had no cause of complaint against Rickard, the builder. By Mr. Kent: He never complained to Thorp, the contractor for the brickwork, about the pier. The witness, asked what training he had had, said he was taught in the Architectural School at South Kensington, after which he was for seven years in the office of his father, a surveyor. He had built many buildings similar to this.



On Monday, Mr. Pawley was recalled and examined by Mr. Horace Avory, his counsel. He said he had been practising his profession about 15 years. Before this occurrence, he had never had fault found with his work as an architect, and there had never been a fatal accident on any of his buildings. During the past ten years he had carried out over £400,000 worth of work. He had previously erected or supervised the erection of lofty buildings of this character. He had prepared calculations showing, in his judgment, the weight that was upon the pier. He made the total weight on the base of the pier at the time of the accident 52 tons 8cwt. 29lb. The weight of the brickwork of the pier above the second floor level, where it left the wall, was 24tons 10cwt. 66lb. Below the second floor level the weight was 14tons 9cwt. 46lb. The weight of the ironwork of the floors and roof upon the pier was 4tons 6cwt. 13lb., including the carriage girders, binders, and lacing joists. The weight of each of the four concreted floors that were in at the time of the accident, calculated at 25lb. per foot super., was 1ton 10cwt. 40lb., making a total weight for the four floors of 6tons 1cwt. 48lb. The concrete on the roof weighed 3tons 8lb. In each case he was speaking of the proportion of the weight that was on the pier. In his judgment the pier was capable of bearing that weight safely. He first heard that a crack had been seen in the pier when Lillywhite gave his evidence last Thursday. He gave directions that the centring was not to be struck. By the Coroner: He could not remember who gave him the details of the pier. The dimensions of the pier which were given on the plan produced were incorrect, but he could not say how the mistake occurred. He made the plan after the accident from particulars supplied by his staff. He could not say who gave him the particulars of the bearing of the ironwork on the pier. The Coroner: There, again, is a most material difference in the way in which the bearing is shown, and the evidence that has been given by various witnesses. Mr. Avory: In your judgment, could the omission of the stanchion have had anything to do with this accident? Witness: No, nothing whatever. Replying to the Coroner, witness said according to the original plans the partitions were to be of wood and glass, but at the request of the Government brick partitions were subsequently put in. Mr. Ashmead, replying to the Coroner, said he

had communicated with the Commissioners of Works, and they instructed him to say that they did not at present propose to call evidence. The Coroner said that in those circumstances they would have no opportunity of tendering evidence, as the inquiry could not be adjourned indefinitely. Mr. Thorp, the contractor for the brickwork, recalled, said the seventh floor girder rested on a 4½in. template in the chimney stack. He could not say who ordered the fixing of the template in that manner. He called the attention of Andrews, the general foreman, to it. Witness said the detailed plans were produced that day for the first time. Andrews, the general foreman, was also recalled, and produced a number of plans which he had found since he last gave evidence. Mr. Avory put in a letter written by Rickard, the principal contractor, to Mr. Pawley in October, 1896, which, he said, completely met the suggestion that from the outset Mr. Rickard was only the nominee of Mr. Pawley. In this letter Rickard said he desired to elucidate the fact as to whether Mr. Pawley "put him down as an ass," and pointed out that there were eight offices to be let at £30 a year, making it a total of £240. The cost of erection would reduce it by one-half, or £120. The building would realise £1,920 yearly, and, said Mr. Rickard, "I will not sign any agreement for a less sum, for it would pay me better to keep it." Mr. H. Collins, F.R.I.B.A., district surveyor for the Eastern division of the City of London, said he had had experience of Mr. Pawley's work, and had never had reason to find fault with it. He had heard the evidence in this case, and had visited Abbey Mansions. The conclusion at which he had arrived was that the cause of the accident was the unfortunate removal of the centring before the concrete had properly solidified. He had examined some of the fallen concrete, and considered it well mixed, and a proper material for its purpose. Concrete 9in. thick should, in his opinion, be allowed to remain from 15 to 20 days before the centring was struck. In his opinion, the fall of the concrete was sufficient to account for all the subsequent phases of the disaster.

Resuming his evidence on Tuesday, Mr. H. H. Collins said he thought it very feasible that the concrete caved in between the lacing joists as had been described by one of the previous witnesses. The concrete would then fall in large or small pieces, having no centring underneath it, and if it fell through a depth of 22ft. it would probably crash on the ironwork underneath, causing it to act as a lever on the pier and throwing it over. He thought that the ironwork of the roof would have stood in its skeleton form had the pier remained in its position. It was the falling of the pier that caused the iron girder of the roof to go. Had the pier been larger, it would not have withstood the falling concrete. The probable spot at which the pier would give way, if it collapsed from its own inherent weakness, was at its base on the first floor. What had been termed "a pier" was in reality a series of piers. The total weight of the brickwork of the series of piers was 27tons 19cwt. The total weight on the pier at its base at the time of the accident was 45 tons. It would require a force of eight times 61 tons to crush the pier. Brickwork in cement required from 60 to 70 tons per foot super. to crush it. His authorities for that statement were Professor Rankin and Professor Cawthorne Unwin. One could put up very large buildings such as they had in America if bolts were used on each floor, and provided there was a base sufficiently large. The addition of a stanchion would have decreased the burden that the pier had to bear, and it would have been wise to have put up a stanchion. In reply to Mr. Gardiner, the witness said he agreed with Hurst's rule that an isolated pier or monument ought not to be built higher than twelve times its largest size at the base. But what had been described as a pier in this case was not a pier, and an architect was supposed to have a little common sense and to know how to use it. By Mr. Ellis Griffith, M.P. (counsel for the roof contractor): The only fault he found with the building was that the centring was removed too soon. He did not believe the evidence of the witnesses who said that the concrete struck the pier, although they might have imagined that that happened. Mr. William Eve, F.S.I., of Union-court, Old Broad-street, said he had had considerable experience in the construction of buildings. He had examined Abbey Mansions, and was of opinion that the load on the brick pier weighed 53¼ tons. That he considered to be a safe weight. The fact that the pier was found in large pieces showed that it was of good construction. He would not like to strike the centring of a concrete roof until after the expiration of 15 days, and he would prefer to allow a lapse of 20 days for the concrete to solidify. He thought that the premature striking of the centring was the cause of the accident, and the fact that the building fell while the centring was being struck confirmed him in that view. His idea was that the concrete fell on the carriage girder of the seventh floor, a distance of 11ft., pressing the girder down and prising up the pier. The pier, no doubt, dragged down the girder joists and the brickwork. By Mr. Avory: There was lateral pressure in concrete. If the "green" or unset concrete fell, the consolidated concrete would follow as soon as the pier was disturbed. In reply to Mr. Thomson, witness expressed the opinion that there ought to have been a stanchion. By Mr. Ellis Griffith: He did not agree with everything that Mr. Collins had said. He had known many buildings to be constructed without plans, but he had not so constructed them himself. It was improper, in his opinion, to fix a girder in a flue without a stanchion being put in. Some of the concrete must have fallen before the pier lurched. Without the stanchion the pier would not have been sufficient to support the building when it was occupied. Mr. E. A. Gruning, vice-president of the Royal Institute of British Architects, said centring should not be struck until about three weeks after the concrete was laid. He had heard the dates upon which the roof was concreted and the centring struck, and did not think the concrete could have hardened sufficiently to render the striking safe. In his opinion it was the falling the concrete on the girder that caused the pier to collapse. It would have required a very much larger pier to have resisted the falling of the concrete roof. By M. Avory: He thought it extremely unlikely that the first thing that happened was the buckling of the pier. Frederick Rough, a labourer employed on the building at the time of the accident, said he called the attention of Andrews, the general foreman, to some cracks in the pier. Andrews attributed them to the engine. Two of the bricks of the pier were crushed, and there were cracks all round it at distance of 4ft. from the ground. Andrews told him that the bricklayer would strengthen the pier. By Mr. Avory: He was certain there was a pier and not a wall in the basement, and that there was an archway over the pier. Mr. Avory remarked that as far as he knew none of the plans showed a pier in the basement. James Andrew, the general foreman, recalled, said the archway was carried on to the chimney-breast, not on to the pier. He absolutely denied that the last witness ever spoke to him about cracks in the pier. He noticed some scratches on the wall; they were caused while the engine and mortar-pan were being removed. By Mr. Thomson: He told some of the men that the engine had knocked a corner off the wall. There were so many sub-contractors that he did not know all the men. He sent a man to examine the pier on each floor, but had never any thought of strengthening the pier. Dixey, the man sent by the last witness to examine the pier, was called, and said he found nothing the matter with it. The archway was carried on to the party-wall in the basement. Walter Ridley, a bricklayer employed in the basement of the building the day before the accident, said the archway was right on the pier as shown on the plan produced. He did not notice any cracks in the pier. The coroner remarked that there had been some extraordinary surprises throughout. He had never heard so many contradictions in important matters of fact.

Edwin Thorp, the contractor for the brickwork, recalled, described an opening which existed in the brick wall in the basement. That hole, he said, was between 3ft. and 4ft. away from the pier, and it was incorrect, as was stated on the previous day, that there was an archway leading close on to the pier. George Curtis, bricklayer, gave corroborative evidence. Mr. Thomas Blashill, F.R.I.B.A., F.S.I., superintending architect of metropolitan buildings and architect to the London County Council, was called, and said he attended, by request of the Council, to give expert evidence. He had examined the south block of Abbey Mansions, and had heard the evidence. There could be no doubt that the collapse of the interior of the building was due to the fall of a detached pier, whether caused by the fall of concrete or not. With regard to the strength of the pier, he did not doubt that it was built of fairly hard stock bricks set in cement mortar. He made its horizontal area 7ft. at the bottom. On the fifth-floor level its horizontal area was diminished to 5ft. It was connected on one side to a wall which ran up the basement story and the ground story, subject to any opening which there might have been in it. He made the weight of the pier itself, together with the weight of the floor and the roof and their girders complete (so far executed at the time of the accident) round the level of the basement floor, to be 48·43 tons. This was rather less than other witnesses had made it; but in this calculation no account had been taken of the 4½in. party-wall which was in course of construction, nor of the storing of building materials. The first question was the resistance of good stock brickwork in cement. That depended largely on the height of the pier in proportion to its smallest horizontal dimensions. Its total height of 105ft. or thereabouts was entirely out of proportion to its width; but he did not make that great height the basis of calculation. He attached very little importance to the wall with which it was connected on the lower story. The wall was built in mortar while the pier was in cement, and any considerable strain on the pier would break its connection with the wall. A pier of proper construction, stiffened at intervals of about 11ft., might, with some qualification, be dealt with in separate sections; but in order to justify this the the floors must be quite rigid, and the construction of the pier, especially where it was connected with the floors, must be perfect as regarded the strength and the arrangement of its parts. If such a pier should be in any degree out of the upright or badly constructed, or subject to the least pressure, except perpendicularly, it must be very materially weakened, and in this way its great height would render it liable to excessive stress in particular parts. Subject to these observations, he had endeavoured to find out the crushing strain and the safe load of good stock brick and cement. On this point there was great variety in the published experiments. The crushing strength of stock brickwork was given at from 18 tons to 30 tons, and even as high as 70 tons per foot super., and the proportion of safe load to crushing load was given by various authorities at from one-fourth to one-twentieth. But he believed it had long been the practice of architects to adopt a load of from 5 to 6 tons per foot super. as a safe load. Professor W. C. Unwin, in speaking of some recent experiments on the strength of brickwork made by a committee of the Royal Institute of British Architects, said that from 4 to 7 tons was a safe load, and that 7 tons was the extreme limit with prudent architects. He thought that recent experiments showed that the safe load would be under the 7 tons per foot given by the witnesses, which was as much as one-half or one-third of the pressure which had crushed a full-sized pier in experiments. On each floor the regular brickwork was interrupted by stone templates going over the whole surface of the pier, and by girders. The girders ran through six courses of brickwork. In no case did the height of any girder coincide with any course of brickwork. No experiments such as had been alluded in this inquiry had ever been made, so far as he knew, on brickwork of this kind. The strongest arrangement as regarded the big girder would have been to have fixed it within the middle third of the area of the pier. Any departure from that position materially weakened the strength of the pier. This girder was within six inches on each floor of the west end of the pier, and bore principally upon one corner of it. In this way the pier at each floor was seriously weakened in its construction, and, besides, was seriously overladen. He had no doubt that at the time of the accident the lower half of the pier, at least, was in certain places dangerously overladen, and that this danger was increasing daily. It might have collapsed at any time from that cause, together with the weakness of construction. Upon the occurrence of any appreciable shock it was nearly certain to collapse. It was not necessary, in his opinion, to assume a fall of the concrete from the roof, and had the disaster not happened at the time when the centring was being removed a fall of concrete would hardly have been suggested as the cause of the accident. As to the concrete roof, he was told by the engineer and chemist to the London County Council that the cement which they had tested was very good. The

material of the furnace clinker or ashes must have varied considerably, as some of the concrete fell in large pieces and some pieces were weak. He believed no coke-breeze was found in the concrete. He had used coke-breeze very largely, and it was not like this. He would not think it unsafe to strike the centring of coke-breeze concrete at the time the centring of the roof of the collapsed building was struck. They struck centring under coke-breeze floors, 4½in. in thickness, in a week or ten days, but the centring in this case was struck in less than a week. A flat roof given that time should have carried itself, but if a portion was of very bad quality it might fall. He had very little doubt that, however it might have fallen, it would have caused the collapse of the pier. He thought that if the pier gave way, without the shock of the concrete, at any part of its height, there would be a short period during which it was going downwards through the crushing of the brickwork, and horizontally in the direction of the staircase. Then after a short period the whole building would collapse, as had been described. If the roof concrete gave way he should expect it to break about the middle in the direction of its length, and under conditions which he described, it would break into two pieces, roughly measuring about 10ft. by 2ft. each, or 20ft. super. The Coroner: I should like to know what your views are with regard to the control of the London County Council? I agree with the district surveyor, Mr. Dru-Drury, that in no circumstances could the district surveyor on such a building have, under the existing state of the law, any control over these piers and girders. Do you wish to give any opinion as to whether there ought to be any such control? Personally, and as a public officer, I think there should be such control. I believe that London is quite exceptional among large cities, whether on the Continent or in America, in being without control of that kind. I have examined building plans for mansions in large cities, including Berlin, Budapest, and others, and I have seen them scored over with the blue pencil marks of the officials, increasing the size of the girders and piers. Then in this respect the district surveyor and London County Council have imperfect control over the construction of large buildings? Yes, to that extent. By Mr. Hugo Marshall (for Mr. Pawley): He did not think the upper part of the pier was overloaded. The danger of overloading came somewhere towards the bottom—the second or third floor. He thought that five tons per foot super. was a safe load; but he was quite in the hands of scientific men on the subject. On the first floor the load weighed 5·64 tons. It was there that the danger occurred most. He could not say that all the danger was below the third floor, as there were no ties on the fifth floor. Any kind of shock, such as that caused by a scaffold-pole falling end-on a girder would have been likely to cause the collapse. He could not go so far as to say that the falling of the concrete knocked the pier down; he did not know how much fell. If the concrete fell first, then it no doubt caused the collapse. It was true that such a shock might destroy a properly-constructed building. He did not consider seven tons per foot super. a dangerous load for this pier. Mr. Marshall: Do you agree with the other expert witnesses that even if the pier had been reasonably larger, it would have been crushed by the falling concrete? I have some difficulty in answering. But if that pier had been of sufficient size, and the concrete had been so soft as to fall, I should have considerable hope that the building would stand. By Mr. Thomson: Assuming that the perpendicular, the ties, and the foundation of the pier were perfect, the fall of concrete might bring it down. By Mr. Gardiner: Any appreciable weight falling on the building might have caused it to collapse. By Mr. Kent: Seven tons per foot super. was the extreme limit for a prudent architect to adopt for a safe load. The actual load on the pier was 6·9 tons per foot super. Mr. E. A. Gruning, V.P.R.I.B.A., recalled, said that in his judgment a safe load to put upon the pier, having regard to its construction and all the details, was seven tons per foot super. There was nothing in the construction of the pier to suggest to his mind that it was the cause of the accident. The Coroner: If you had been the architect of this building would you have put in a pier of that description? I think it possible that I should have used iron columns. Mr. S. Murrell, the roof contractor, recalled, produced his invoices for 41 yards of coke-breeze, which he said was used in the construction of the roof. This closed the evidence.

The Coroner, in summing-up yesterday (Thursday), reviewed the whole of the evidence, and pointed out that the duty of the jury was to find whether there was any culpable negligence on the part of any persons who had contracted or subcontracted for any work. There were only two suggestions for the jury to consider, to arrive at a just verdict. The first was whether the concrete was not properly set or properly mixed, and whether the removal of the centring was the cause of the accident. The next was whether the pier was improperly constructed and faulty in design. There was also another alternative—that the collapse was due to the falling of the concrete and the pier combined. With regard to the pier, he would ask them to disregard the evidence of Collins, the stonemason. There was no suggestion that the bricklayers had not done their work properly. Mr. Pawley took upon himself the responsibility of the construction of the pier. That being so, they would have to consider if there were any culpable neglect on this head. The question would be one of criminal responsibility. They must consider the fact that the pier had been carried up considerably higher than allowed by the Building Act. It was clear that Mr. Pawley had an interest in this venture from the start, and actually bought the builder up, and, as a matter of fact, Mr. Pawley was the beneficial owner. He warned Mr. Pawley at the commencement of the inquiry that it would have been desirable if he had been advised by the County Council at the early stages. There were many statements in Mr. Pawley's evidence which were not right. The brick pier was not at any time 3ft. 6in. by 2ft. 6in., and it was perfectly plain that the calculation Mr. Pawley had submitted was not made until after the accident. Mr. Pawley found it necessary to correct himself on several occasions, and therefore he did not think the jury need take very much notice of anything Mr. Pawley had said at that time. With regard to the 9in. wall, that was another fiasco. A great portion of Mr. Simpson's evidence had been put on one side by expert evidence. There was actually no clerk of the works, which was a most astounding fact in buildings of these dimensions. There could be no doubt that some of the brickwork had been crushed by the enormous weight upon it. The evidence of Mr. Andrews, the general foreman of the building, was very peculiar. This witness had said things about the building of the pier which were absurd, and some of his evidence had to be dragged out. It showed great carelessness that he should have permitted the improperly mixed concrete to be taken up to the roof. Mr. Troutbeck then commented strongly upon the fact that no mention had been made of the hole left in the main wall for the workmen to pass through, until nearly the close of the inquiry. He said the extraction of evidence from witnesses was like drawing teeth, and he could not understand why, in such a case, there should be any reason for concealment. The evidence of Thorp, the master bricklayer, Mr. Troutbeck thought, was exaggerated, and he hoped Mr. Thorp's statement that he came down from the roof partly because he thought it was dangerous, leaving his workmen up there, was an exaggeration; for to warn the men under such circumstances was a moral obligation. Commenting upon the knocking away of the centring from under the concrete roof, the Coroner said it was extraordinary that Parker should have done this after he had apparently received positive instructions not to. Referring generally to the contradictory evidence, the Coroner pointed out that nearly all the witnesses were employed by people who were to a certain extent interested parties.

THE VERDICT.

The jury found that the deceased men met their deaths in the collapse of the Abbey Mansions, which collapse was due to the faulty construction of the pier, owing to the culpable negligence of the architect. They were also of opinion that the concrete was improperly mixed, but that this was not the initial cause of the accident.

The Coroner expressed the opinion that the verdict was equivalent to one of Manslaughter against Mr. Pawley, the architect.

Bail was fixed at £200 for Mr. Pawley, and £100 for his solicitor.

FOUNDATIONS AS APPLIED TO LONDON BUILDINGS AND RIVER-SIDE FOUNDATIONS.*

THERE are few subjects with which an architect has to deal which involve the consideration of so many points of detail as the subject of foundations. It involves a knowledge of the applicability and the durability of various materials, experience in drainage, and not infrequently an acquaintance with contractors' plant as well as the best way of economically distributing structural loads, for which expert knowledge engineers are usually given credit. The variation in London soils and subsoils is well described in a pamphlet recently written by Mr. Horace B. Woodward, F.R.S. So much of the top soil with which foundations are concerned is of an artificial character that only actual excavation can determine the true nature of a site. Geological maps furnish standard information respecting the natural lower strata, but possess very little value as regards the mixed character of the top soil. Made ground may be a foot to 25ft. or more in thickness. At the Bank of England there were 22ft. of made ground resting upon 4ft. of gravel. Some of the made ground is of ancient date, and preserves relics of Roman occupation, but in some parts the subsoils have been excavated for ballast or gravel, as at Kensington, or for brick earth, as at Highbury, and the pits filled in with rubbish. A rock which forms an excellent and unchanging foundation in one situation may prove a dangerous foundation in another. Thus, chalk forms a good limestone foundation in certain positions, but when it dips towards a slope or a cliff, with an outcrop of the gault or other underlying clay, it is a very unsuitable foundation for any building, as the landslips of the Isle of Wight and of the Dorsetshire coast bear witness. Chalk also is subject to dissolution by the action of carbonated water, whereby comparatively wide cavities become formed in its surface, which may be wholly or partially filled with gravel and sand, and cause inconvenience. In the same way, to be partly on gravel and partly on clay or brick-earth, to be on or over the margin of an old excavation since filled with rubbish may lead to trouble. Where foundations are carried down into clay, the excavation may form a tank, into which the water from surrounding gravel may accumulate. The

VARIATIONS IN THE UPPER SOILS OF THE METROPOLITAN AREA

may be illustrated by the following records:—At Chelsea Barracks, boring through made-ground and running sand shows the clay to vary very considerably in depth below Trinity high-water level, which is 12ft. 6in. above Ordnance datum. In 1895, a return of the burial grounds in the County of London, with a statement of their size, ownership, and condition was prepared for the London County Council by Mrs. Basil Holmes, from which it appears that there are 362 burial-grounds existing in the County and City of London, of which 321 are disused. Of this number 90 are employed as public recreation grounds, and the remainder are closed. Prior to the passing in 1884 of an Act to prevent the erection of buildings on burial-grounds, about 100 to 150 graveyards had been entirely built over, appropriated as sites for railways, or annihilated by new roads. Her Majesty's Stationery Office Waste Department stands on a site in Earl-street, Westminster, formerly used as Hartley's marble works, but originally the site of the plague pits connected with the Tothill-fields pestfield, of which area Vincent-square now remains open as the playground of Westminster. The pest-houses erected in 1642 were not removed until this century. Charterhouse-square, Holborn, is also a part of the site of a burial ground, dating back to the 14th century, for the burial of those who died in the plague at that time. In the County of London the only encroachment now permissible on a disused burial ground is the enlargement of an existing place of worship, although in the City the Commissioners of Sewers have the right, under certain circumstances, to appropriate portions of them for the widening of roads. There are excavations in the Metropolis in which human bones have been discovered on sites which have been dug out, and then filled in with *débris* from disused burial grounds adjoining, when the latter were used for

* By ARTHUR T. WALMISLEY, M.Inst.C.E. A paper read before the London Architectural Association on Friday, May 20, 1898. (See report p. 735, *ante*).

buildings before the passing of the disused Burial Grounds Act (17 and 48 Vict.) The above report, which is accompanied by a map, definitely fixing the position of old burial grounds, is therefore of great value. A boring made in Tallis-street, on the Victoria Embankment, showed the following strata:—(1) 1ft. 6in. ballast, dirty; (2) 6in. green sand, wet and dirty; (3) 2ft. peaty clay; (4) 6in. green sand; (5) 5ft. 6in. peaty bog; (6) 9ft. running sand; (7) 4ft. clean ballast resting at a depth of 23ft. below the ground line upon blue clay. At boring at Highbury New Park gave (1) 2ft. made ground; (2) 18ft. loam; (3) 9ft. sand; (4) 1ft. peat; (5) 8ft. gravel and sand. A boring at Peckham gave (1) 3ft. gravel; (2) 14ft. loam and sand; (3) 3ft. gravel. At Kensington, the soil is described by Mr. W. Bennett Rogers, in a paper read before the Institute of Estate and House Agents, "to be mostly a rich dark loam; secondly, a silicious gravel from 5ft. to 10ft. in thickness; and, thirdly, a strong leaden coloured earth known as blue clay." The foregoing observations show that while trial bore-holes should always be made before designing a foundation, to ascertain the character of the subsoil, care must be taken

NOT TO CALCULATE UPON UNIFORMITY.

Thus at the Admiralty extension new buildings forming block 2, now in course of erection by Messrs. John Mowlem and Co., one of the bore-holes upon the south-west side of the old buildings showed the clay to be about 29ft. 6in. below the surface of the ground, while actual excavation proved the dip of the clay to be such that in the execution of the new building it became necessary to underpin the north-west corner of the old building at the deepest part, 42ft. below the ground. The strata in the bore-hole referred to gave about 18ft. (average) made ground, 2ft. ballast, 5ft. dirty sand, 2ft. 6in. clean sand, with 2ft. running sand and slurry, making a depth of 29ft. 6in. to the clay. The old walls of the Admiralty premises were found to be built upon oak sills. These were removed where underpinning was necessary, so as to build and pin up with solid brickwork. There being two floors below the ground in the new building, a concrete retaining wall has been constructed completely round the exterior below the ground, and joined up to the underpinning work; the whole site is covered with concrete 6ft. thick, thus forming a huge tank of an average inside clear depth of 20ft., in which the basements are built. The underpinning to the old wall consists of brickwork 4ft. 3in. thick and 14ft. to 20ft. deep, below which concrete 6ft. deep, with set-offs of 12in. on one side are inserted to a width of 5ft. 3in., for the upper portion of 3ft., and a width of 6ft. 3in. for the base or lower portion of 3ft. Messrs. Leeming and Leeming are the architects, who also designed block No. 1 forming the new Admiralty Buildings facing St. James's Park, the foundations for which are likewise somewhat appropriately placed in a dry dock built upon the London clay at a depth of 30ft. in solid concrete 6ft. thick. At the Hotel Victoria in Northumberland-avenue, Mr. Florence, the architect, found that this building has a frontage of 300ft.: 38ft. 6in. made ground clay and gravel mixed, 4ft. gravel and sand, 6ft. rising sand, 2ft. fine ballast, and at a depth of 50ft. blue clay. At the south end the clay was 43ft. down; at the north end 37ft. The front wall was constructed on a concrete bed 9ft. wide. Another bed 15ft. wide carries the two walls of the central corridor. The whole site was surrounded by a similar wall of concrete, about 6ft. wide, forming a species of boxes, and the whole covered with a depth of 6ft. of concrete, upon which the walls were raised. The spaces between are now probably full of water. At the Grosvenor Hotel, Pimlico, there were 4ft. of made ground overlaying 11ft. of alluvium, and 9ft. of sand and gravel. Messrs. J. Grover and Son, Wilton Works, New North-road, N., forward the accompanying description of bore-holes made in Parliament-street before starting the trenches. The bore-holes were taken at the corners of the site. The foundations are Portland cement concrete, and go down to the ballast or to the London clay. The concrete was 6ft. and 5ft. wide under external walls, and 4ft. under the interior walls. The site is that of an old creek that ran up to Scotland Yard. When Messrs. Grover were building New Scotland Yard they came across old wharves and barges at about 30ft. below the level of the Embankment. As the water from the land still finds its way through the old channel, the foundation required the aid of pumps. Messrs. Holloway Brothers, of Battersea, formed a foundation where they encountered running sand upon a site in Parliament-street (the Swan Electric Light premises, near Grindlay's bank) by driving small piles—7ft. or 8ft. long and 6in. circular, and pointed—as close together as possible over the whole foundation; then sawing off the tops level, and building a concrete raft 7ft. or 8ft. thick over the whole area. The new City Hall, Belfast, designed by Messrs. E. Thomas and Son, architects, Queen Anne's-gate, stands on a piled foundation, the site being a deep stratum of yielding alluvial deposit. Such foundations are common in Belfast, and generally consist of larch or other straight round timber, often 40ft. to 50ft. in length. The custom is to saw off the heads of the piles after driving to a proper and uniform level, and place upon them timber sleepers to aid the support of a concrete table. Mr. Florence obtained the following section for a building in Victoria-street, Westminster:—(1) 4ft. made ground; (2) 4ft. black peaty silt; (3) 3ft. sand and gravel; (4) 13ft. coarse gravel. At the Army and Navy Auxiliary stores the formation at about the same depth was also found to be sand and gravel. A clear stream of water runs through it, in which a chimney shaft was built by the aid of pulsometers and sumps. The area of these premises has a foundation of 5ft. Portland cement concrete all over it, 7lb. lead being used as a damp course. At the National British Gallery, Grosvenor-road, designed by Mr. Sidney R. J. Smith, the soil consists of surface earth over peat, under which are clayey bands and bands of sandy clay, all of which were pierced by the foundations until the ballast of the river bed was reached at an average depth of 17ft. to 20ft., and in some parts 25ft. No particular difficulty was experienced. The site is that of the old Millbank Prison, known as the Penitentiary. At the gasworks in the Horseferry-road 30ft. of gravel are recorded as having been passed through, and this gravel is frequently waterlogged, so that where foundations of houses pass into it with unprotected basements, the water becomes troublesome during high tides, rising in the cellars of houses built upon such low-lying ground. Alluvial deposits prevail over part of the area, consisting of silt and clay varying in thickness from 7ft. or 8ft. to a thin crust. The gravel and sand on the site are of considerable thickness. In the case of a clayey subsoil overlying a watery gravel, where structural loads are not sufficient to warrant extending the foundations through the gravel to the clay, it is well to leave a thin crust of the clayey material over the gravel so as to prevent the water working up through the foundation, which would cause the gravel to work loose. In dealing with a loamy soil it is quite possible to overload a foundation. Water will drain through a loamy soil that is not spongy. When dry, like cheese, it does not then contain the argillaceous matter which gives it a spongy character, and which would cause it to run, under pressure, like mud. Brick seating on concrete has been employed for piers to a warehouse, built over a good dry compact loam foundation.

CONCRETE FOOTINGS

provide a distribution of weight over the whole area when a sufficient depth of concrete for a footing is put in, because every cavity or unevenness of the ground is properly filled with plastic material. Concrete also is quite as good as brickwork or masonry to bring the work up to the surface under ordinary circumstances, but in the case of piers subject to vibration, brickwork is decidedly preferable. Brickwork also may be used of smaller dimensions than concrete, so that the space occupied is less. Thus, at the Borough Market, Southwark, where the foundations had to be carried down from 22ft. to 24ft. below the ground line, the piers carrying roof columns were built in brickwork over concrete footings. When stone templates are introduced on top of piers, as is frequently found expedient, it must be remembered that the great thing is perfect bedding of them in cement. At the Tower Bridge, layers of canvas and red lead were placed between the base of the steel column and the granite beds upon which they stand, in order to obtain a uniform bearing over the whole surface. Felt carefully laid under the bearing of iron girders is preferable to sheet lead, unless the pressure is sufficient to crush the lead, so as to insure a uniform distribution of pressure. Portland cement should be used for concrete work under a bed of stone. Ordinary lime concrete is long in setting. The centre of the mass of a large concrete block may not become hard for years, where a block made of one part Portland cement to seven parts of other approved ingredients, carefully and well mixed, will safely bear a load of five tons per square foot. According to Mr. Stoney, bricks not of an extra hard description in cement will bear a crushing weight of 5211b. per square inch, or 33⅓ tons per square foot. Allowing a factor of safety of 6, we obtain 5·6 tons per square foot safe load. Rivington's notes on building construction give brickwork in mortar ½cwt. per square inch safe resistance to compression, or 3·6 tons per square foot. The resistance of brickwork to cracking or crushing in a pier is much less than that of the bricks alone. Ordinary stock bricks will stand ·8cwt. per square inch, or 5¾ tons per square foot. Much valuable information hereon was given in the investigations made by three series of experiments on brickwork tests, made for the Royal Institute of British Architects, and published in their *Journal*. In the case of the Imperial Institute bearing plates for the girders, where resting on brickwork, were calculated for 16 tons per square foot of area, but then special bricks of Jennings manufacture, built in cement, were employed. In fixing stanchions over a cement base it is necessary to provide ample space for grout. The stanchion is set vertical by means of long and shallow wedges, occupying a depth sufficient to allow 1½in. under the base of the stanchion, and a hole 2in. diameter should be left in its base, as near the centre as possible, not to pour in the grout, but to see it rise when the under part of the stanchion is completely grouted up. A temporary trough is formed round the base to receive the liquid grout, and the wedges should not be drawn until the grout has well set. In the case of a roof of three spans, subject to the effects of lateral wind pressure, when supported on side walls with intermediate columns, where the situation did not permit either the addition of buttresses or of anchorage in these side walls, the horizontal reaction of the wind-pressure may be taken by anchoring the intermediate columns to a concrete foundation. At the Institution of Chartered Accountants, Moorgate-street, Mr. John Belcher found the ground so unreliable that he adopted the precaution of putting a layer of Portland cement concrete over the whole site 3ft. deep. The result has been satisfactory, no settlements having occurred anywhere. At Kennet's Wharf, upon the Middlesex side of the river near Southwark Bridge, the foundation consisted of 8ft. of concrete spread all over the site and increased in thickness under the main walls. The late Mr. G. E. Street, R.A., used selenitic lime in the concrete foundations of the Law Courts. Under some of the walls it was 7ft. thick, and that under the walls of the Great Hall was 10ft. thick. Portland cement concrete rafts, 2ft. thick, have been built under five-story buildings on compact loamy soil over gravel, the concrete being dipped where required to obtain the proper fall for drainage-pipes to run over the surface. Another plan frequently advantageous to adopt is to sink piers 12ft. to 15ft. (centres) apart, and 4ft. 6in. square, in pot-holes dug out of made ground, and then to form concrete arches over the intervening unreliable ground, with a minimum thickness of 18in. This plan was adopted by Messrs. F. and H. F. Higgs for some premises at Stratford and at Lea Bridge, also for a church at South Bermondsey. In the latter case, 6ft. of soft clay or mud, then 5ft. or 6ft. of peat and 4ft. of running silt had all to be gone through before the gravel was reached, and the concrete piers were here connected by a concrete lintel 3ft. thick, in which steel joists were embedded. At the Institution of Civil Engineers, 25, Great George-street, Westminster, the foundations to the two party-walls upon each side of the Institution building were carried down about 22ft. below the pavement level, that on the west side being 22ft. deep, that on the east side 21ft. The front wall was 25ft. below the paving level. The concrete was laid under walls only, and was about 10ft. 6in. by 5ft. 2in. wide at the east party-wall. Mr. Charles Barry was the architect, and Messrs. John Mowlem and Co. were the contractors. The Institution of Mechanical Engineers at Storey's Gate, Westminster, stands on what appeared to be a wharf, and the roadway in Princes-street was possibly an inlet of the Thames. The contractors excavated the piling and black earth—formerly, doubtless, faggots—and gradually came to a fine Thames sand at a depth of 23ft. below the roadway, gradually

getting coarser until fine gravel was reached at a depth of 28ft. below the roadway, upon which the concrete foundations were laid. The main walls were then marked out and excavated to a mean level of 28ft., the strata gradually developing into a fine gravel, which Mr. Basil Slade, the architect, considered, after sounding, to be a good foundation. On this, concrete composed of blue lias lime and Thames ballast was laid to a depth of 10ft. 6in. and width 7ft. 6in. Water seemed to circulate through the gravel below a mean depth of 23ft. 6in., and the influences of the tides were felt. A pulsometer pump in a well was set to work, and the trenches drained sufficiently to allow of work being executed; after the concrete was all laid, the water was allowed to find its level. At a depth of mean level 15ft. 6in., a table-top or basement floor was laid, and a layer of Portland cement concrete 6in. thick as foundation of finished floor in granolithic or asphalte. The stratum throughout was very even, and the work progressed steadily without difficulty. There are two floors below the ground floor, both of which, the architect states, are as dry as a bone. The damp-course and retaining wall lower course was of trowelled Seyssel asphalte. The precaution was taken of putting drain-pipes in the concrete below water-level, to allow the water to pass freely through the sand and gravel within the main walls. An exhibited sketch explained the difficulties which had to be encountered. At the Surveyors' Institution, 12, Great George-street, in the new building designed by Mr. Alfred Waterhouse, architect, and built by Messrs. Foster and Dicksee, contractors, the section of strata shows 3ft. or 4ft. of made ground on top, about 4ft. black mud, 6ft. clay and brick earth, clay and sand mixed, and 3ft. gritty sand, below which is the ballast, or London gravel. In some cases the foundations were carried down 18ft. deep, but only where the principal weights of the structure occurred. A concrete (6 to 1) raft, 2ft. 6in. thick, is carried on continuous concrete walls round part of the outside and under main walls and piers of the building. Continuous concrete about 14ft. deep under the raft, and width 5ft. 6in. to suit the footings of a 2ft. 3in. wall (footings 4ft. 6in. plus 6in. concrete either side = 5ft. 6in.) All timber was removed in lengths of, say, 10ft., as the concrete filling (3ft. framing) was carried up. At the British Institute of Preventive Medicine, Chelsea Bridge-road, the foundations were carried through made ground and clay under, to a depth of 40ft. below street level; under the clay was found peat, and under the peat 5ft. to 6ft. of fine dirty sand—then ballast. A concrete raft, 3ft. 6in. thick (six to one), intervenes between the top of piers and the bottom of the brick footings. The position of the piers under the raft was settled by the cardinal points of the building, thus forming a kind of propped-up dining-table or platform with several legs. Mr. Dulac, one of the contractors for the Paris Exhibition of 1900, has endeavoured to avoid the labour of excavation and necessity of carting away bad ground; also, to save the expense of timbering and trenching by compressing and ramming the soil in the following manner:—With the aid of a steam pile-driver and the employment of rams of various shapes he forms a bore-hole, which he fills with hard substances after each stroke of the ram. Thus, in dealing with a light, friable soil, a conical ram is used, and in some cases a mushroom-headed ram is applied successfully. In this way, by forming holes about 3ft. apart, and forcing the selected material sideways into the ground surrounding the cavity, the soil is consolidated to receive a superstructure. The drop allowed for the ram depends on the nature of the ground, the operations in the case of water-logged soils being aided by the insertion of ashes mixed with quick-setting cement, intended to produce a species of tube or sheath for the passage of the ram in the driving in of further hard substances. At Victoria Station, Pimlico, the engineer to the London, Chatham, and Dover Railway, Mr. Roche, states that in recent work they have found good gravel at a depth of 16ft. from the surface, and have dug 8ft. into the gravel without passing through it. At Sion College, upon the Thames Embankment, Messrs. Foster and Dicksee state that in this foundation they went down to the London clay. The method there adopted was to have great pier holes 8ft. by 8ft. on plan, going right down to the clay, filled up with cement concrete, and from these brick arches carrying the main walls. In cases where partly-made ground and partly water-bearing gravel are encountered, a raft of concrete, about 6ft. to 9ft. thick, has been successfully used with a gridiron of steel contained therein. The lecturer described in detail the steel construction introduced into a concrete foundation at points where main pressures occur, in the case of the building of a new front to a Congregational Chapel at Canning Town, designed by Mr. F. W. Troup, architect, where the foundations had to pass through layers of peat and clay to the ballast below and where the new front had to be constructed so as to be independent of the interior existing building. Also some premises known as Mansfield House, by the same architect, in which concrete 3ft. thick was laid as a foundation, with 8in. by 3½in. rolled steel joists, having bolts 12in. long at each end, so as to give a tie in the centre of the concrete raft in which they were embedded. Very little excavation was needed. The subsoil consists of layers of peat, peaty clay, and clay to a depth of 15ft. to 20ft., when good ballast is reached. The foundation sunk 1¾in. at one corner at the back of the premises, and 2in. and 3½in. respectively at two corners of the front of the premises, but no cracks appeared in the building generally, and the sinking appears to have gone on as the building rose. One corner of the building in front overhung about ⅞in., but the other parts of the building appeared to remain quite vertical. At the back of the premises the top of the concrete, which was laid 9in. lower than in the front portion, was 18in. above the natural level of the ground. It is natural that the lower down the river we go, any foundation work becomes more troublesome than is generally expeperienced in up-river sites.

(*To be continued.*)

ART METAL-WORK EXHIBITION AT WESTMINSTER.

THE Loan Exhibition of historic metal-work now being arranged in St. Stephen's Hall at the Royal Aquarium, Westminster, in connection with the handicraft and competitions displays for wrought iron and other departments of artistic workmanship in metals, bids fair to surpass anything of its immediate kind hitherto held in London. The exhibition, too, of the trades section will be fairly representative, judging from the collection of exhibits already on view. In this preliminary notice we do not propose to enter upon anything approaching a detailed account of the exhibits; indeed, before going to press this week it would be scarcely possible to do so, as, of course, a goodly number of the best things to be shown are hardly in position. The exhibition is to be opened informally to-day; but, owing to the State obsequies of Mr. Gladstone at Westminster Abbey to-morrow, the council decided to abandon the reception originally intended in connection with the inauguration of the exhibition. The President, the Duke of Westminster, in consequence of the funeral of England's great statesman, is prevented from attending till after Whitsuntide. The judges assembled on Thursday to award the medals and prizes for the competitions drawings in artistic design. Professor Banister Fletcher, J.P., presided, and among those present were Professor Aitchison, R.A., President of the Royal Institute of British Architects; Mr. H. D. Searles-Wood, F.R.I.B.A., Mr. Hy. Longden, Mr. Sidney R. J. Smith, F.R.I.B.A., Mr. W. Hilton Nash, F.R.I.B.A., Mr. Maurice B. Adams, F.R.I.B.A., Mr. Hampden W. Pratt, F.R.I.B.A., President of the Architectural Association, Mr. Carl Krall, and several other gentlemen chosen from the Council. The Loan Exhibition, which is being arranged by the hon. sec. of the exhibition, Mr. J. Starkie Gardner, includes contributions of exquisite examples from H.M. the Queen, such as Prince Henry's suit of armour from Windsor, the Earl of Essex's half-suit, a French suit also from the Castle. The Pembridge Helm is lent by Sir Noel Paton, and the Queen sends Hampden's sword and the Cid sword, likewise from Windsor. From Parham comes a fine Gothic 15th-century suit, and Mr. Morgan Williams shows a similarly beautiful suit of same period as the last named. Sir Christopher Hatton's suit is lent by Mr. Davis, and the Duke of Norfolk lends the Becket Cup. From Penshurst a double-handed sword of Leicester's, with Bear and Ragged Staff in chased steel, is exhibited. Major Farquharson's historical series of gun-locks and pistols is extremely interesting. The armour from the Temple and plate to be seen, to say nothing of the Italian bronzes, add considerably to the charm of the assembly of works of art. These are grouped in glazed cases, and a comprehensive and descriptive catalogue of the collection is in course of preparation as a record of the exhibition. We may, in conclusion, draw attention to five plaques from Kew Palace, illustrating Louis XIV. taking Franche Comte and Lorraine. These are lent by her Majesty. From Battle Abbey a fine gold brilliant (Gothic) is lent by Sir Noel Paton.

The Sheffield School of Art shows a fine set of high-class designs by students in the classes there for bronze, gold, and steel work. Many of these are refined, and have taken prizes at South Kensington and elsewhere.

Among the trade exhibits, to some of which we shall refer in detail later on, will be found collections by Messrs. Starkie Gardner and Co., Albert Embankment; Messrs. Drake and Gorham, Victoria-street, S.W.; Messrs. Perry and Co., Grafton-street, W.; Mr. Henry Hope, Lionel-street, Birmingham; the Coalbrookdale Company; Messrs. Burt and Potts, 38, York-street, S.W.; Messrs. Lindsay, Neal, and Co., Paddington; Mr. George Wragge, of Salford; the N.A.P. Window Company, Victoria-street; Messrs. Hayward Bros. and Eckstein, Union-street, Borough; Messrs. Strode and Co., Osnaburgh-street, N.W., and others.

OBITUARY.

MR. JOHN STARFORTH, architect, who was well known in professional circles in Edinburgh, died suddenly on Friday when walking along Princes-street. The fatal seizure was due to an affection of the heart. The deceased, who was seventy-five years of age, was born in Durham, and was educated at the University of his native city. Going to Edinburgh as a youth, he entered the office of Burn and Bryce, architects, and served his apprenticeship there. Subsequently he began business on his own account, and during his long professional career he enjoyed a large share of public favour. He had several of the qualities of his old master, Mr. David Bryce—not the least important of which were the knowledge and skill which he put into his designs, and the thoroughness with which he saw his work carried out. He became also a recognised authority on English Gothic; and in many of the churches which he designed the influence of Durham Cathedral, which had impressed itself upon him as a lad, made itself felt. Among other buildings of importance with which his name is associated as architect are Dumfries and Galloway Royal Infirmary, Greenock Asylum and Poorhouse, Berwick Infirmary, Peebles Hydropathic, John Knox Memorial Institute, Eyre-place Church, London-road Church, Bonnington United Presbyterian Church, Moffat Parish Church (an example of Gothic adapted to Presbyterian worship), the first Kelso United Presbyterian Church, Nairn Parish Church, Holy Trinity Church, and Galashiels Free Church. He was in his day a noted church builder, and the many ecclesiastical edifices in all parts of the country which he designed are a credit to his artistic ability and taste. In a national competition for the Edinburgh Prince Consort Memorial his design received the first place, but it was afterwards abandoned for the present equestrian statue of the Prince in Charlotte-square. Mr. Starforth also gained the gold medal of the Highland and Agricultural Society for the best design for farm buildings. He was intrusted with the erection of many mansion-houses in the Highlands and West of Scotland, and with not a few of their owners he afterwards remained on intimate terms of friendship. To this his fondness for angling and shooting largely contributed. Mr. Starforth is survived by a widow, three sons, and two daughters.

SIR JOHN T. GILBERT died suddenly on Monday at Dublin, while on his way to attend a meeting of the Royal Irish Academy. As a mark of respect to the deceased, the meeting of the Academy was adjourned. Sir John Gilbert was born in 1829 in Dublin, where his father was Portuguese Consul. He was for some time Secretary of the Public Record Office of Ireland, and of the Irish Archæological and Celtic Society; he was vice-president and honorary librarian of

the Royal Irish Academy, a governor of the National Gallery of Ireland, a member of the council of the Pipe Roll Society, and of the first council of the Bibliographical Society of London. He was also Honorary Professor of Antiquities in the Royal Hibernian Academy of Fine Arts, and a Crown Trustee for the National Library of Ireland. He was author of a history of the City of Dublin, for which he received the Cunningham gold medal, and he made numerous reports on MSS. for the Historical Manuscripts Royal Commission. In addition, he was the editor of "Facsimiles of National Manuscripts of Ireland," and a "Calendar of Ancient Records of Dublin."

MR. MEADOWS WHITE, Q.C., M.A., who recently resigned his position as Judge of the Clerkenwell County-court on account of ill-health, died on Saturday. Mr. Frederick Meadows White, who was the second son of the late Mr. John Meadows White, of Stanhope-place and Whitehall-place, was born on December 21, 1829. He was educated privately, and at Balliol and Magdalen Colleges, Oxford, of which latter College he was Fellow. He was called to the Bar at the Inner Temple in 1853, was appointed Queen's Counsel in 1877, and elected a Bencher of his Inn the following year. Mr. Meadows White was Recorder of Canterbury from 1883 to 1893, when, on being appointed a County-court Judge, he resigned that position. He was an elder brother of the late Mr. William Henry White, secretary of the R.I.B.A. from 1878 till his death last year, and had been an Hon. Associate of the Institute since 1882.

CHIPS.

On the 7th inst., the Lostwithiel Borough Council re-elected Mr. Robert W. Reed as their surveyor and sanitary inspector.

A parish church is being built at Glounthaune, near Queenstown Junction, from plans by Mr. S. Hyses, of Cork. The church, which will seat 1,000 persons, is built of local limestone, and consists of nave, north and south aisles, chancel, and sanctuary. Mr. J. Coffey, of Midleton, Co. Cork, is the builder, and the stained-glass windows in the chancel are by Messrs. Lavers and Westlake, of London.

The organ which has just been introduced into the Barclay Free Church, Edinburgh, was formally opened on Friday night. It is constructed on the Hope-Jones electric pneumatic system, and cost, without case, £800.

The Duke of Westminster presided over a meeting at Grosvenor House in connection with the reconstruction of the Belgrave Hospital for Children, which it is proposed to remove from Pimlico to a site in Clapham-road, adjoining St. Mark's Church, Kennington. The sum of £4,000 was subscribed towards the cost.

The County Council's Building Act Amendment Bill, introduced to clear up doubtful points in the Act of 1894, has been approved by a Committee of the House of Commons. Special exemption is made as to building over forecourts and the height of houses in the case of the City, and by the instruction of the House of Commons the Stock Exchange was also exempted from the application of the Amended Bill.

Alderman Tolhurst, who was Mayor of Southend-on-Sea last year, has presented the borough with a Jubilee marble statue of the Queen. It represents her Majesty seated in a chair of State, in a proportion of figure which if standing erect, would be 8ft. in height. It is placed on a pedestal 10ft. high of white Carrara marble. The sculptor is Mr. J. W. Swynnerton. The statue, which faces the well-known pier, was unveiled on Tuesday by Lady Rayleigh, wife of the Lord Lieutenant of Essex.

On Wednesday week at St. Anne's, Edgeside in Rossendale, at three o'clock, three stained-glass windows, which have been placed in the chancel as memorials, were unveiled. The window on the north-east represents the Shepherds visiting Mary and Joseph at Bethlehem. The central window represents Christ addressing Mary at the Sepulchre on the morning of the Resurrection. The window on the south-east represents Christ addressing the Disciples at the Supper at Emmaus on the evening of the Resurrection.

A new Wesleyan chapel is about to be built in Stoney Stanton-road, Coventry. It will be of red brick with stone dressings, will have an angle tower and spire rising to a height of 85ft., and the internal woodwork will be pitch-pine. Seats will be provided for 700 adults, and the cost of erection will be £2,910. Messrs. Harrison and Hattrell, of Hertford-street, Coventry, are the architects, and Mr. C. Garlick, jun., of Far Gosford-street, in the same city, is the contractor.

COMPETITIONS.

BALLYCASTLE, Co. ANTRIM.—For the drinking fountain to be erected at Ballycastle as a memorial to the late Dr. O'Connor, the design sent in by Mr. S. Kelway Pope, of Portland-street, Southampton, has been selected. The fountain will be 32ft. in height; the materials—viz., Newby granite, Portland stone, and red granite.

CRICH WATER SUPPLY.—A few months ago the Belper Rural District Council invited competitive schemes for supplying the parish of Crich with water—a district containing about 3,000 population. Ten schemes were submitted, engineers from London, Brighton, Birmingham, and Yorkshire competing. The council decided that the scheme submitted by Mr. Harry W. Taylor, A.M.I.C.E., of St. Nicholas Chambers, Newcastle-on-Tyne, and Birmingham, was the most suitable, and this was accordingly adopted. Mr. Taylor was engaged as engineer for the execution of the work. The scheme consists of pumping water from a deep well sunk in the millstone grits, into a concrete reservoir of 50,000 gallons capacity. Treble-barrel deep-well pumps, driven by gas or oil engines, will be used, the machinery being in duplicate. The cost of the scheme will be about £3,000.

OUNDLE.—The committee appointed to carry out the scheme for the proposed new town-hall as the Diamond Jubilee commemoration, received, in response to the invitation, several designs from architects. It was unanimously resolved to accept the one bearing the motto "Nene," the author being Mr. J. B. Cerby, F.S.I., of Stamford. The plan provides for a central approach from West-street, with committee-rooms right and left of entrance, ticket-office, and stairs to approach the council chamber above. The main hall in the rear is about 70ft. by 22ft., having stage space, with retiring room and conveniences. The front will be of rubble stone, with freestone dressings, and the roof of grey slates; the remainder of the walls to be carried on in brickwork.

TAUNTON.—A meeting of the Market Trustees was held on Friday morning last for the purpose of receiving the report of Mr. E. W. Mountford, F.R.I.B.A., of London, the assessor appointed to make the awards for plans for the proposed town-hall. The meeting was a long one, and produced much discussion. In his report, Mr. Mountford said that of the thirteen sets of plans sent in, half a dozen at least were far in excess of the average of plans which were generally sent in for such a competition, while he particularly mentioned one or two as being about the best he had ever seen. The plans were lettered from A to L, according to the date of receipt, and he awarded the premiums to those marked A, H, and L in the order named. The design marked E was in many respects one of the best, but it failed in regard to provision for shops and market. A committee reported that after viewing the plans they were practically unanimous in deciding to recommend the trustee to adopt the award of Mr. Mountford. After discussion, it was decided to hold an adjourned meeting "to accept the awards of Mr. Mountford, and to negotiate with the architect who has obtained the first prize with a view to carrying out the work." On opening the envelopes with the names of the architects, "A" proved to be by Messrs. Samson and Cottam, of Hammett-street, Taunton, an announcement received with applause. The second prize was won by Mr. J. M. Brydon, F.R.I.B.A., Adelphi, London, and the third by Mr. Henry T. Hare, A.R.I.B.A., of Bloomsbury, London. The other competing architects were:—Messrs. Gibson and Russel, Grey's Inn-square, London (who sent in plans marked "E," which were highly spoken of by Mr. Mountford); Messrs. Tapper and Crouch, Grey's Inn-square, London; Mr. Knill Freeman, Bolton; Messrs. C. Silcock and Reay, Bath; Messrs. J. Houghton Spence and J. T. Bell, Taunton; Messrs. Mallows and Grocock, Bedford; Mr. W. H. Crease, M.S.A., Bristol and Taunton; Mr. G. Elkington, F.R.I.B.A., 95, Cannon-street, London; Mr. C. Henman, 64, Cannon-street, London; and Messrs. Murray and Foster, London. It was decided to publicly exhibit the competitive plans until Wednesday in this week in the Parade Assembly-room. The style adopted by Messrs. Samson and Cottam is of the Renaissance period. The amount of money at the disposal of the trustees for building purposes is not sufficiently large to admit of great elaboration of the design. The building will cover the whole of the space at present occupied by the old Market House and its adjoining structures. It will also extend forward for a considerable distance upon the Parade. Red brick and terracotta will enter largely into the construction of the outer walls of the building, and relief will be given to the structure by a row of stone columns running along the principal frontage, which will face the Parade and consequently look straight up North-street. At each end of the main front there will be a massive square turret, and a stone balcony will run from one turret to the other above the tier of columns previously mentioned. The turrets will also be relieved with Corinthian columns in their upper parts, whilst the lower will be formed entirely of stone. A clock-tower will rise from the centre of the roof. At the rear, in Fore-street, provision has been made for a dozen lock-up shops to run along the entire length of the building. On the ground floor there is, firstly, a covered market in the centre for florists and greengrocers. At the eastern end of the market there will be a guild-hall, and at the opposite end wine and spirit merchants' offices and stores, the present tenants of a portion of the old market house. On the first floor will be an assembly-room 94ft. by 62ft., with a stage about 30ft. by 25ft., orchestra, &c. Four dressing-rooms are provided in connection with the stage, and it is suggested that the ceilings of the stage be constructed of light framework made easily removable, so as to give ample space for wings and flies when the hall is used for theatrical purposes. There are four staircases for the use of the general public, and one staircase for use in connection with the stage. The entrance to the assembly-room will be on the east side of the building, facing the Jellalabad Monument.

WOLVERHAMPTON.—At a private meeting of the Board of Guardians, on Friday, convened to consider the question of the new workhouse, and the recommendation of the General Purposes Committee, that only three architects be allowed to supply plans for the new building, it was decided that the whole of the architects in the Wolverhampton Union be allowed to compete.

The foundation stones of a new Wesleyan chapel, at Elmswell, West Suffolk, were laid on Monday. Messrs. Eade and Johns, Ipswich, are the architects, and Messrs. Hogg and Son, Coney Weston, the builders. The outlay will exceed £500.

Mr. G. Wilcocks, M.Inst.C.E., attended at the Guildhall, Walsall, on the 19th inst., and conducted an inquiry on behalf of the Local Government Board with reference to an application to sanction a loan of £1,000 for the widening of the thoroughfare in George-street, and £700 for the public baths.

William Jeffrey, 56 years of age, master painter and decorator, was killed at Eccles on Thursday in last week. He had to paint the back bedroom window of a house in Cannon-street, and his ladder being short he tied an old one to it. While standing on the old portion, at a height of 14ft., the ladder broke, and he fell to the flags, receiving injuries from which he died immediately.

The Local Government Board has sanctioned the borrowing by the Barton Rural District Council of £1,130, and by the Urmston Urban Council of £2,374, for the extension and improvement of the joint sewage disposal works at Flixton. Mr. C. C. Hooley, C.E., surveyor to the former council, has just completed the construction at Davyhulme of a bacteria filter-bed to prevent the pollution of Bent Lanes Brook.

A county museum for Hertfordshire is about to be built at St. Alban's, on a site given by Earl Spencer. Mr. Arthur S. Flower, M.A., F.S.A., is the architect of the building, which will be built in sections as funds allow. The portion now to be built will comprise the main entrance hall and staircase, lecture-room and library, curators' room, and museum. Larger galleries will be erected as the funds come in and specimens accumulate. Selected firms of Hertfordshire builders are to be asked to submit tenders for the work.

Mr. W. O. E. Meade-King, M.I.C.E., Local Government Board Inspector, held an inquiry at the Birkenhead Town Hall on Friday respecting an application by the corporation to borrow £13,000 for new public baths and washhouses.

The Right Rev. Dr. Ilsley, Roman Catholic Bishop of Birmingham, laid the foundation-stone of a new church, dedicated to Our Lady of the Angels and St. John the Evangelist, at Princethorpe, near Rugby. The church is being erected by Messrs. Foster and Dicksee, of Rugby, to designs by Mr. P. P. Pugin, architect, of London.

PARK MANSIONS, ALBERT GATE.—NEW WORKHOUSE BUILDINGS, SHOREHAM.—NO. II. THAMES STREET, WINDSOR. "GLENROY," FINCHLEY. — GLASGOW CATHEDRAL. — FOREST LODGE, TULSE HILL. — RANDOLPH HALL, CAMBRIDGE, MASS.

Our Illustrations.

PARK MANSIONS, ALBERT GATE.

THIS building, now in course of erection at the junction of Kensington and Brompton roads, will cover an area of about 36,000sq.ft. The ground floor (as will be seen by the plan) will consist of 38 shops, with light showrooms on mezzanine floor over, and also well-lighted stores in basement, with ample lavatory accommodation. There will be a central arcade from Kensington-road to Brompton-road, and a fully-licensed hotel (known as the Paxton's Head), and also a licensed café, will be incorporated in the new building. The six upper floors will consist of 114 self-contained flats of from two to six rooms each, with bath-room, larder, and coals. The small suites are intended for the occupation of members of clubs and bachelors, and on the top floor will be a service-room, and a large kitchen fitted with every requisite. There will also be a service lift to each floor. Three staircases furnish the means of access to the first and all floors above. In the well-hole of each will be provided a hydraulic passenger elevator. There will also be two additional staircases for the servants, and goods lifts. The whole of the building will be of fire-proof construction, and the elevation will be executed in Bath stone and red bricks, with red granite pilasters. The builder is Mr. A. Kellett, of Old Oak Wharf, Willesden, and the architect is Mr. G. D. Martin, 3, Pall Mall East, S.W.

NEW WORKHOUSE BUILDINGS, SHOREHAM, BRIGHTON.

THE guardians of the Steyning Union (which includes the west end of Brighton, besides a large rural district), having acquired an extensive site on the Upper Shoreham-road, are about to build a new workhouse, which, while arranged and constructed with regard to economy both in first cost and administrative expenditure, shall provide all that experience has found to be best in arrangement, fitting, and other details. With this end in view, a sub-committe, accompanied by the architects, have visited many of the metropolitan and county workhouses, and the buildings which we illustrate to-day are the result of these investigations. They will include tramp-wards and receiving-wards in the entrance block, with dining-hall, kitchens, masters' and matrons' administrative departments, from which, by covered corridors, the various workhouse pavilions, &c., will be reached. The scheme also provides for an extensive laundry, workshops, boiler-house, stabling, and other accessories. The heating, sanitary, and cooking arrangements have been especially studied, and the buildings are so arranged as to be capable of easy extension without any sacrifice of executed work. The whole of the buildings have been designed by the architects to the board, Messrs. Clayton and Black, of Brighton.

NO. II. THAMES-STREET, WINDSOR.

THIS house is situate in Thames-street, Windsor, and opposite the Castle walls. The view shows the house from Thames-street, but only the left-hand upper part of front has lately been altered. The rear of the building has been entirely rebuilt, the business premises being kept absolutely distinct from the private-house portion. Access is gained to the private house by a flight of stone steps from lobby in Thames-street, which lead up to a small square hall. As shown by plans, there are three sitting-rooms, together with kitchen and offices, on this floor, with separate trades staircase in rear. On second floor there are four bedrooms, bathroom, dressing-room, &c., and three rooms in attic. Messrs. Hollis and Sons, of Windsor, were the builders, and the works have been carried out under the superintendence of, and from the designs of, Mr. Ernest R. Barrow, A.R.I.B.A., architect, London.

"GLENROY," FINCHLEY.

THE illustrations of "Glenroy" represent additions to a house built from plans by Mr. E. W. Poley, architect, some few years ago, consisting, as shown by the plans, of a billiard-room, offices, and servants' stairs on ground floor, three bedrooms on the first floor, and commodious coal, wine, and other offices in the basement. The contractor is Mr. C. Plowman, of West Finchley, N.

GLASGOW CATHEDRAL.

WHEN illustrating the general view of this building and an interior sketch by Mr. Herbert Railton of the rood-loft in the BUILDING NEWS for May 13th, we directed the attention of our readers to the capital volume just issued by Messrs. Morison Bros., of Renfield-street, Glasgow, under the title of "The Book of Glasgow Cathedral." Pressure on our space on that occasion prevented the inclusion of the accompanying drawings by Mr. D. Small from the same building, but we promised to refer again to the matter. The view given of the choir, looking from the aisle, shows the excellence of the architectural design which it illustrates. The clumsy seats which pack both aisles are most objectionable, destroying the effect of the wall arcades, and spoiling in no little degree the proportions of this part of the church. The whole of the choir is filled with needlessly high pews, and the sacrarium is now fitted up, of course, for use as a Presbyterian place of worship. The aisles are vaulted, but the main body of the church was designed to have a wooden roof. The capitals of the arcade piers are richly carved: but the foliations have been patched with cement in a most unwarrantable manner. Much damage has been done here, as elsewhere, by ignorant over-restoration. The triforium is of a type frequently met with, and is of excellent character, of the Lancet period. The peculiar position of the Chapter-house at the north-east corner of the choir is to be noted. Its only access is from the lower church. The sacristy is placed over it, with a door into the east aisle of the choir, and a staircase in a turret provides means of communication between the sacristy and the Chapter-house, also between the upper and lower churches at this point. The variations in the details of the design of this Chapter-house building as compared to those of the choir, go far to record its date of execution. Here we have the same base as that of the choir, and the same windows, narrow lancets with clustered shafts in the jambs and between the two lights—a perfect 13th-century elevation—and yet "there can be little doubt," says Mr. Honeyman, "that this building as it now stands was not completed till the 15th century." It may have been completed in the 13th century, and, with the hall of the vicar's choral, subsequently ruined by violence or accident, but it is difficult to believe that a Chapter-house was begun in 1230 and left unfinished for nearly two centuries. There is hardly a trace of Perpendicular work in Glasgow Cathedral, and yet when this Chapter-house was finished the Perpendicular style was fully developed in England. We thus see how extremely interesting this work becomes. The sections given in the volume add to its value.

FOREST LODGE, TULSE HILL, S.W.

THIS house, the residence of Mr. G. Adney Payne, has been refronted and much added to in a handsome way by Messrs. Wimperis and Arber, the architects. The plan has been remodelled. One of the chief improvements consists of a richly-designed library, of which we hope to give an illustration shortly. The bookcases and the fire-place are the chief features in the apartment, which is furnished in oak, with bronze fittings. The entrances to the carriage-drive are formed by a fine pair of wrought-iron gates. The drawing illustrated by us to-day shows the porch and new façade. The house, as advertised elsewhere, will be offered for sale by auction on June 9, by Messrs. Stimson and Sons, of 8, Moorgate-street, E.C.

RANDOLPH HALL, CAMBRIDGE, MASS.

THIS large block of students' quarters is now in course of erection as a private dormitory building for Harvard University. Each study has two bedrooms in connection with it, and a bath-room and w.c. A couple of large breakfast-rooms with kitchens are contrived on the ground floor, where the janitor's quarters are located. The two views given herewith and the plans sufficiently illustrate the work, which is treated in a simple and broad manner architecturally. Messrs. J. R. Coolidge, jun., and V. Wright are the architects. The buildings are to be finished for occupancy next year. We are indebted to the *American Architect* for the accompanying drawings.

CHIPS.

It has been decided to erect a new church at Ravensthorpe, in the diocese of Wakefield. The cost is estimated at £10,000, and towards this an anonymous gift of £3,000 has been received.

The Government of India has decided that in future officers of the Royal Engineers should invariably be employed in designing the construction and making the periodical inspections of fortified frontier forts and posts, this provision being held to be most necessary as a military precaution.

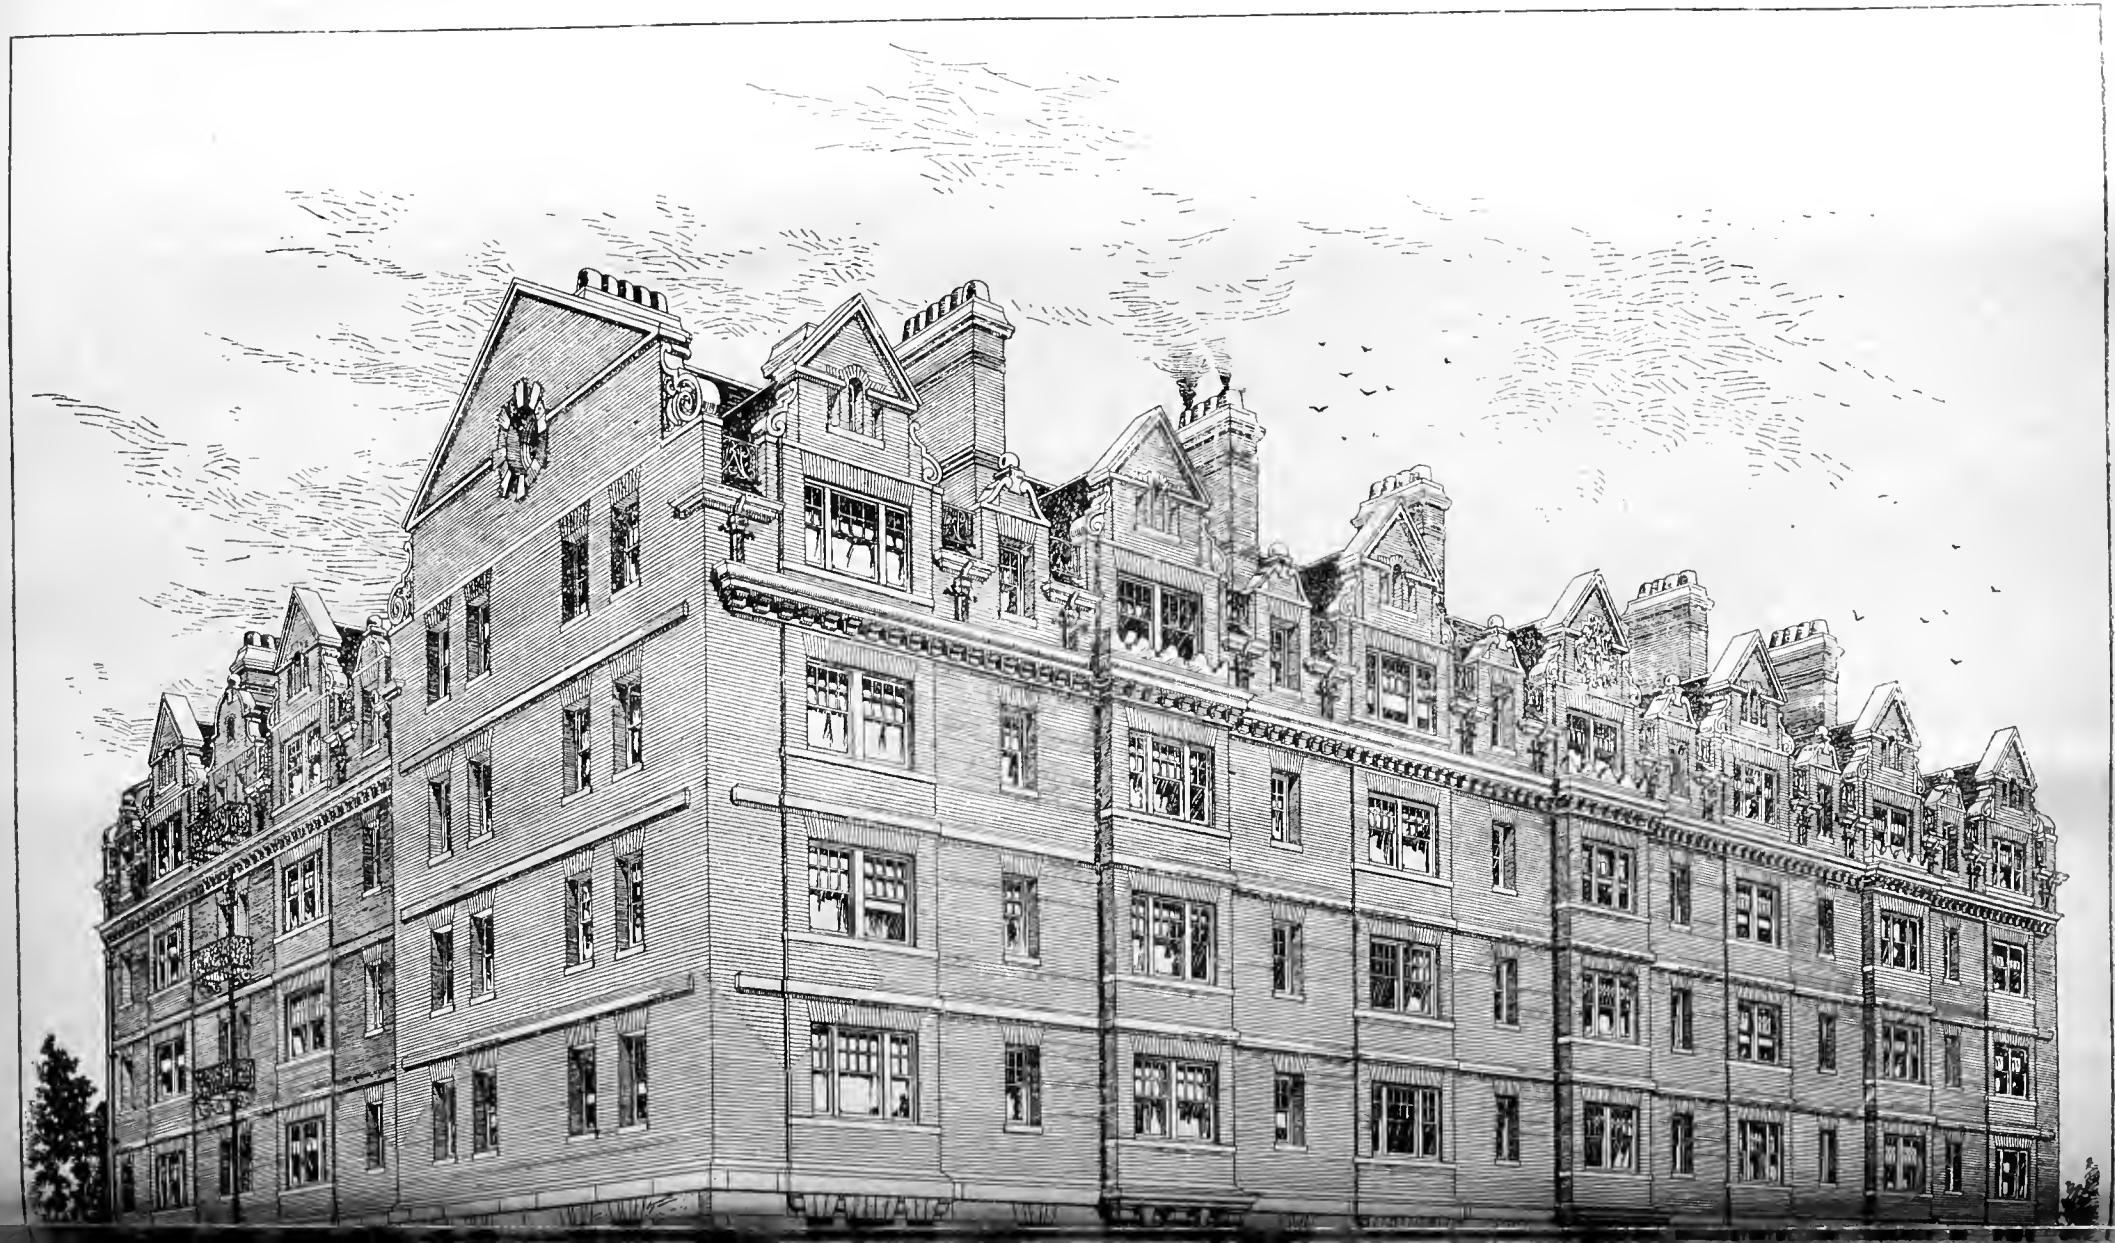
At the last meeting of the Mersey Docks and Harbour Board, the chairman, Mr. John Brancker, was presented with his portrait in oil by his colleagues on the Board. Mr. Brancker afterwards presented the portrait to the Board, and it is to occupy a permanent position in the Board-room. The portrait is the work of Mr. R. E. Morrison, of Liverpool.

The Mumbles Pier, just opened by Lady Jenkins, has been erected by the Mumbles Railway and Pier Company, at a cost of over £16,000. It runs out from a part underneath the rocks just beyond the Mumbles village for about 830ft., so as to accommodate steamers at low tide. The pier is constructed of iron. It has a centre widening of 60ft. by 40ft., and the head is 135ft. by 84ft. The neck portion is 25ft. wide, and has two enlargements opening to 37ft. Around the pier-head a landing-stage, constructed of wood and entirely separate from the pier itself, has been constructed with platforms, landings, and steps.

A rood screen has just been placed in the village church at Down Ampney, Wilts, from designs by Mr. C. E. Ponting, F.S.A., of Marlborough. It is 15th-century in style and executed in oak, enriched by gilding. The whole of the sanctuary has been laid with marble. The church has been seated throughout in oak, as also has the side chapels. The south chapel has been inclosed with screens, the altar foot pace laid with many coloured marbles, and the old tombs restored. The whole of the work has been carried out from the designs and under the direction of Mr. Ponting by Messrs. Harry Hems and Sons, of Exeter.

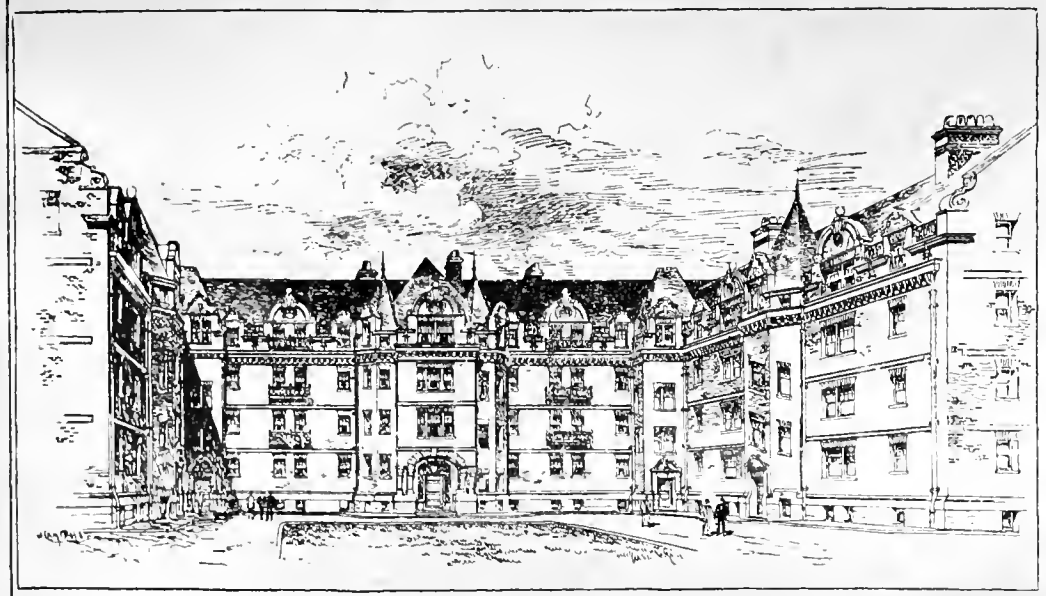
At Christie's, on Saturday, the greater portion of the important collection of pictures formed by the late Mr. Joseph Ruston, of Lincoln, was sold. The total amount realised was £43,000. The pictures which brought the highest prices included three by D. G. Rossetti—the "Veronica Veronese," 1,550gs.; "Dante at the Bier of Beatrice," 3000gs.; and "La Ghirlandaja," 3,000gs. Two of Sir E. Burne-Jones's "The Mirror of Venus," 5,450gs.; and "The Chant d'Amour," 3,200gs. One of Mr. G. F. Watts's "The Eve of Peace," 1,350gs.; a Rembrandt, a portrait of Nicholas Ruts, 5,000gs.; and a Gainsborough, a portrait of Lady Clarges, 1,850gs.

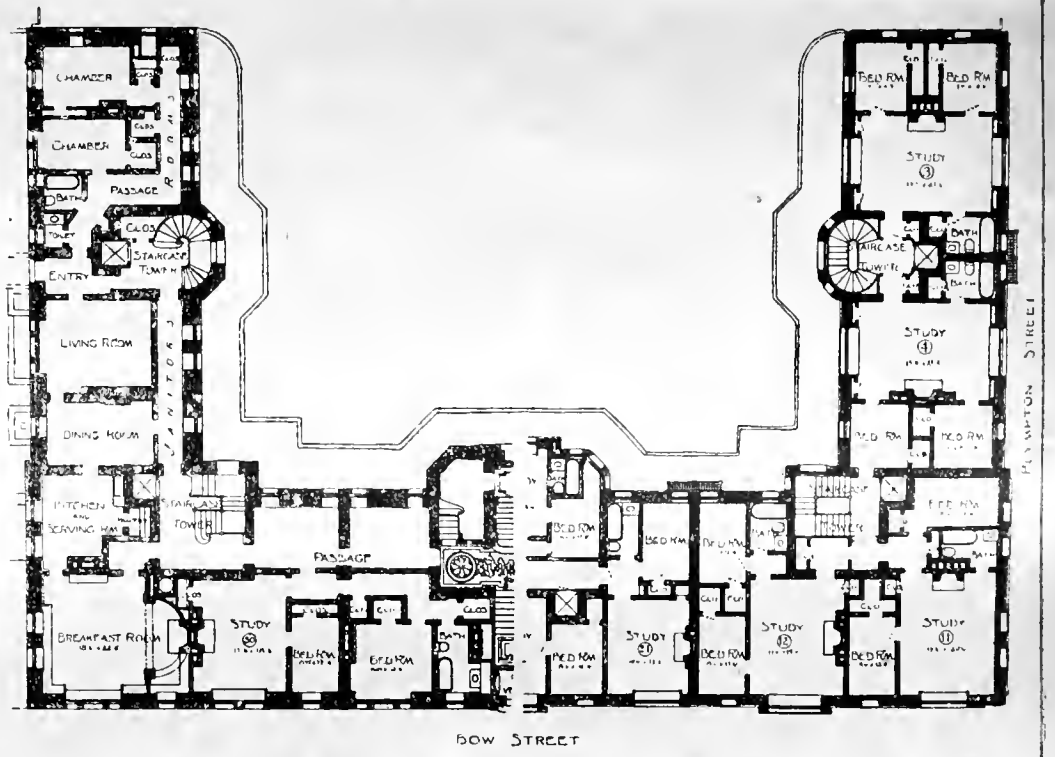
The Earl of Jersey and Colonel Boughey, R.E., held, on Thursday and Friday in last week, an inquiry at Colwyn Bay touching an application to the Board of Trade for the construction of a light railway, eight and a half miles in length, between Llandudno and Colwyn Bay, the gauge being 3ft. 6in., the plan on the overhead system and worked by electricity, the estimated cost being £67,000. Mr. Dickenson, C.E., the engineer of the scheme, explained the plans, and the commissioners stated that they had recommended that the order be granted.



RANDOLPH HALL, CAMBRIDGE, MASS.

J. R. COOLIDGE, JR., & V. WRIGHT, ARCHITECTS.





GROUND FLOOR PLAN

SECOND FLOOR PLAN

Building Intelligence.

Highworth.—New mixed schools, erected by the Highworth School Board, were formally opened last week. They are Modern Gothic in style, and are faced with red pressed bricks, the tracery, mullions, and dressings being of Guiting stone from the Tally-ho quarry near Nutgrove, Oxon, while the roof, which is of high pitch, is covered with Bangor Lady slates. The accommodation is on one floor, and consists of five classrooms leading off a central hall, the whole being designed for 360 children. The system of heating introduced is that of Grundy's M.B. hot-air grates, and provision has been made for the ventilation of the different rooms by means of a series of Boyle's fresh air inlets and extractions. The playgrounds, which have been levelled and gravelled, are of ample size, the whole site acquired by the board being 1½ acres in extent. In the centre of the playgrounds and detached from the main structure, are playsheds for both girls and boys, with offices adjoining. The cost of the building, of which Messrs. Bishop and Pritchett, F.S.I., Swindon, were the architects, has been £1,400, and the work has been carried out by Mr. Joseph Thomas, of Highworth.

Northampton.—A special meeting of the Northampton Union of Baptist Churches has been held for the purpose of receiving the builders' tenders for the new Baptist Chapel in Adnitt-road, Monk's Park. A Sunday-school will be afterwards built on an adjoining site, with a frontage in Lea-road. A number of architects were invited to prepare plans, and a London assessor selected the design of Messrs. Mosley and Anderson, of Abingdon-street, as being the best and most suitable. The main building will consist of nave, with gable-end transepts, and with an aisle on either side. The aisles have lean-to roofs. The nave is lighted, not only from the windows in front, but from the windows in the half-timbered clerestory. The baptistry is immediately in front of the rostrum. Behind, separated from the chapel proper by an internal passage, are the vestries. The chapel will accommodate about 450 worshippers. Five Northampton builders were invited to tender, and these tenders, when opened, were found to be exceedingly close, only about £100 separating the highest from the lowest. The tender of Mr. A. P. Chown for £1,475, the lowest figure, was accepted.

Truro.—At the eighteenth annual meeting of the Cathedral Union of Truro, held on Friday, Canon Wortledge, hon. secretary, reported the twelvemonths expenditure, plus the deficit of £120 with which the year began, was £1,187, and the total income from all sources £1,115. Mention was made of the donation of £500 by an anonymous donor, by whose generosity £500 had been also given to the Cathedral Building Fund. It has been invested in existing annuities, and will produce an annual income of about £15 to the permanent maintenance fund of the cathedral. First payment of £111 has also been made under the Archdeaconry of Cornwall Act, 1897, by the Ecclesiastical Commissioners towards the maintenance fund. It was announced that in a short time the building of the nave would be recommenced. Towards this work £27,000 had already been raised, and another £8,000 is needed to complete the work.

On Wednesday week a new Wesleyan chapel, situated in Sydney-street, Burton-on-Trent, was formally opened. The edifice is Gothic in style, and will seat between 400 and 500 people. It is faced with pressed bricks with Hollington stone dressing, and the woodwork is of red deal. The cost was about £1,300. Mr. C. F. Underhill, of Burton, was the architect, and Mr. J. Harlow the contractor.

By order of the First Commissioner of Works, in accordance with the commands of the Queen, the grounds of the Ranger's Lodge at Greenwich and the Royal Palace at Kew will henceforward be opened to the public; and the grounds of the Queen's Cottage at Kew were also formally added to Kew Gardens on Saturday.

Earl Beauchamp opened an exhibition of pictures at the Bermondsey Settlement, Farncombe-street, Jamaica-road, on Tuesday afternoon. The exhibition comprises 174 pictures, which occupy the lecture-hall, reception-room, and one of the largest classrooms. The exhibition will be opened free from 10 a.m. to 10 p.m. each day till Saturday in next week, June 4.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

QUESTIONS.

[11956.]—**Electric Accumulator.**—(1) How large would accumulator have to be to drive a bicycle, with weight of 11 stone, 12 miles. (2) How long would it require to charge it with ⅓H.P. gas-engine? (3) What would be its weight, and what would be its price? (4) How often can accumulators be used? (5) What size and price of dynamo for charging accumulator?—Verax.

[11957.]—**Breweries.**—Can any readers inform me if there is a good book published on the construction of breweries, or if any articles have appeared on this subject?—T. W. Hooley, F.R.I.B.A.

[11958.]—**Stone Lintels and Architraves.**—Will a practical mason explain how a lintel of Portland stone, 5ft. long between supports, can be jointed without visible joints, and where should the joints be placed, or would one long stone be better?—Young Architect.

[11959.]—**Fixing Columns.**—Stone columns of three-quarter projection are required for an ashlar front, and I should like to have the opinion of any practical reader as to the mode of fixing them, or whether they should be bonded to the wall, or let into a hollow; also if the frustra ought to be dowelled together?—T. L.

[11960.]—**External Wall.**—A and B are adjoining owners. B. wishes to raise his building and build an adjoining wall close to A.'s wall, which is a party-wall. Is B. compelled to give A. notice of the raising of his wall? It is built on his ground by the London Building Act.—Owner.

REPLIES.

[11954.]—**Water in Gaspipes.**—In all cases gas-pipes should be made to fall; but the direction of such fall must be guided by the circumstances of each system of pipes. If the meter is a wet meter the pipes are best laid falling to, same as mentioned in the query. Should the meter be a dry one, the water which condenses in the gas-pipes must be kept out of the same, or otherwise it will damage the internal fittings. Preparation must be made in this case for the water to fall into a drop-pipe, with emptying tap attached, the supply-pipe from meter being branched into the side of this pipe. Branches to gasaliers should be short as possible, and be taken from the top of the gas-main pipe, the main-pipe being run past the gasalier with the end soldered up to form a receptacle for any water formed. Receptacles of this form should also be arranged on gas-pipes crossing floors in a direction contrary to the direction of the joists. Not less than ¾in. branches should be laid to all lights. All horizontal pipes along sides of joists or bare walls should be carried upon wood grounds, or strips of timber nailed to the joist. This prevents sagging of the pipes, which almost invariably cause jumping gas-lights at certain periods.—Plumber.

CHIPS.

A new Bible Christian Church, in Stanford-avenue, Brighton, was opened on Friday.

The parish church of Old Fletton, Hants, is about to be restored from plans by Mr. Wm. Boyer, of Peterborough.

The offices belonging to the board of guardians, at Hunslet, near Leeds, are about to be enlarged at a cost of £1,660, from plans by Mr. Richardson, architect, of Rothwell. Separate accommodation will be provided for the board of guardians, the Hunslet Rural District Council, and the local board of overseers.

The application for discharge from bankruptcy of Thomas and Walter Cross, of Warrington, builders, has been refused.

At the monthly meeting of the council of the Hampstead Antiquarian and Historical Society on Thursday in last week, attention was called to the fact that the demolition of some of the old houses in Church-row had been commenced that day, with a view to the erection of flats on the site of the houses in question. Arrangements were made by the council for photographs to be immediately taken of the houses about to be pulled down.

Sir John Wolfe Barry, President of the Institute of Civil Engineers, and Mr. William Matthews, C.E., of London, paid an official visit to the North Pier at Tynemouth, on Friday afternoon, and made an inspection of the structure, with special reference to the damage caused by the storm in March last. They were accompanied by Mr. C. B. Goldson, chief assistant engineer, and Mr. C. N. King, assistant engineer, to the River Tyne Commissioners.

Colonel J. T. Marsh, R.E., Local Government Board Inspector, held an inquiry in the council room, at the town offices, Littlehampton, on Friday, respecting applications made by the urban district council for sanction to borrow £300 towards defraying the cost of the erection of a public convenience on the green near the pier and £600 for the purposes of storm-water drainage.

The Bishop of Beverley, on Saturday afternoon, conducted a service at Swinton, near Rotherham, where the Hon. H. W. Fitzwilliam performed the stone-laying ceremony in connection with the restoration of St. Margaret's Church. The church, with the exception of the tower, was destroyed by fire in March, and the contract for the restoration was let for £5,000. Mr. E. Isle Hubbard, M.S.A., of Rotherham, is the architect.

The urban district council of Yardley decided on Tuesday to take steps to obtain plans and specifications for new offices to be built on a site already purchased in Stratford-road, Sparkhill.

The properties offered at the Auction Mart last week varied very much in character, and have included country residences and estates, City and West End freeholds and leaseholds, Metropolitan and suburban investments, ground-rents, &c., and for all classes the demand was up to the best average. The aggregate realisation was £238,160, upwards of £100,000 in excess of the returns registered for the corresponding week in 1897.

Services in connection with the opening of a new Primitive Methodist Chapel and Sunday-school at the Birks, Morley, took place on Saturday. The premises have been built at a cost of £1,600, from designs prepared by Mr. T. A. Battery, Morley, and accommodation is provided in the chapel for 250 adults, and in the schoolroom underneath for 300 scholars. Morley stone has been used in the erection of the building, and the woodwork is in pitchpine, varnished.

The chapel which has been erected at Llangefni as a memorial to the Rev. Christmas Evans, the well-known Welsh Baptist divine, was opened on Sunday. The cost of the building was £2,000. The architect is Mr. Evan Evans, Carnarvon, and the works were carried out by Messrs. R. and J. Williams, Upper Bangor.

The funeral of Mr. Hugh Jones, builder, 20, Globe-street, Walton, near Liverpool, took place on Saturday at Anfield Cemetery. The deceased was a well-known and respected inhabitant of Kirkdale for over a period of 50 years.

A brick and tile company has been formed at Kexby, near Gainsborough, with a share capital of £2,000. Ground has been purchased from Mr. Wm. Woods, and a modern plant laid down. The works will be in full operation in a few days.

FOREST LODGE, TULSE HILL. WIMPERIS & ARBER ARCHITECTS

PROFESSIONAL AND TRADE SOCIETIES.

The Architectural Association of Ireland.—At the annual meeting held on May 17th, the following were elected as committee and officers for the session 1898-9:—President, J. Howard Pentland, R.H.A.; vice-presidents, Joseph Holloway and George Sheridan; committee (9), H. Allberry, F. Batchelor, T. Coleman, T. E. Hudman, A. I. McGloughlin, L. O'Callaghan, Cecil Orr, R. C. Orpen, and M. J. Tighe; hon. treasurer and registrar, F. G. Hicks, 5, St. Stephen's-green; hon. librarian, Joseph Geoghegan, 22, Clare-street; hon. secretaries, R. M. Butler, Dawson Chambers, Dublin, and A. W. Moore, 183, Great Brunswick-street, Dublin (the above form the committee); hon. auditors, T. F. Slevin and J. W. Boucher.

British Association of Waterworks Engineers.—The third annual general meeting of the British Association of Waterworks Engineers, which lasts over four days, opened at Southampton on Tuesday. There was a large attendance of delegates, and the mayor gave them a cordial welcome. Mr. W. Matthews, the Southampton borough waterworks engineer, took the chair as president-elect for the year and delivered his inaugural address. The company, together with a number of residents, were afterwards entertained by the mayor to lunch on the Royal pier. In reply to the toast of "Success to the Association," the president stated that although only established three years ago, the association numbered over 200 members, who had charge of the water supply to 11½ millions of people, and they had the care and management of works of the value of over £40,000,000. The afternoon was devoted to the reading and discussion of various technical papers. On Wednesday a business meeting was held in the morning; after luncheon the members visited the works of the South Hants Waterworks Company, examining in detail the wells, headings, pumping-station, and softening works on the subsiding system. The annual dinner took place in the evening; and under the presidency of Mr. Matthews yesterday (Thursday), a business meeting was held in the morning, and after lunch a visit was paid to the Southampton waterworks. To-day (Friday) the members will visit the Portsmouth waterworks and Gosport waterworks, and to-morrow will be devoted to excursions to places of interests in the neighbourhood of Southampton.

On Wednesday week the Bishop of Southwell reopened the Church of St. Helen's, Austerfield, after restoration from designs by Mr. C. Hodgson Fowler. Many objects of antiquarian interest have been disclosed during the recent restoration, chiefly a Norman arcade buried in the north wall, which now occupies its original position. A new north aisle has been built by subscriptions from the Society of Mayflower descendants in America, and other descendants of the Pilgrim Fathers, and a memorial brass is shortly to be inserted in this aisle in memory of William Bradford, who was a native of Austerfield.

The new board schools, Portsmouth, are being ventilated by means of Shorland's patent exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

At Wolverhampton, on Monday, the chairman of the Parks and Baths Committee performed the ceremony of opening St. George's Churchyard, which has been laid out by the corporation as an open space for the people. The work has been taken in hand by the borough surveyor, Mr. J. W. Bradley, and a large number of tombstones have been removed, walks have been made, and the ground has been turfed and planted with trees and shrubs.

A serious accident occurred on Saturday afternoon at the new Warwick Revolving Tower, now being completed at West End, Morecambe. The tower, similar to one opened at Great Yarmouth last season, and another now being constructed at Scarborough, is on a novel principle, a framework of about 15ft. in diameter and 130ft. high being encircled by a large car, said to be capable of holding 200 persons, and revolving on a platform as the latter ascends and descends. The tower was expected to open for Whit-week, and on Saturday, shortly after two o'clock, the cage, occupied by about eight or ten workmen, was hoisted 20ft. with a view to a preliminary trial. As the cage was being lowered, one of the wire ropes snapped. The cage descended rapidly; eight men were injured by the impact, and four had to be conveyed to the Lancaster Infirmary.

PARLIAMENTARY NOTES.

The Collapse of Abbey Mansions, Westminster.—Sir H. Vincent asked the First Commissioner of Works on Tuesday whether the block of buildings at Abbey Mansions, Victoria-street, at which the roof recently fell, was exempt from the provisions of the London Building Act, 1894, by reason of any exemption or privilege attaching to the Crown or to the Commissioners of Works; whether the Commissioners of Works had, through any officer or officers, supervised or prescribed the structural construction or solidity of the building, or whether any responsibility in regard thereto was undertaken by the Commissioners or their officers; whether the County Council had ever brought to the attention of the Commissioners the question of exemption, or inquired whether any exemption was claimed; and whether the Commissioners caused the height of the building to be raised. Mr. Akers-Douglas: I am advised that no exemption whatever from the Building Act and no privilege can attach to the building by reason of any Government exemption or privilege. An agreement was entered into last November, under which, in certain eventualities, the Commissioners of Works might have become lessees of the building when fully completed; but until then they had no present interest in it, and they have never been in occupation. My department has exercised no supervision whatever, nor made any prescription in regard to the matter, and no responsibility in regard to the structural construction or solidity attached to the department, or was undertaken by it. The County Council never brought the matter to the attention of the department, and made no such inquiry. If they had, they would have been informed that no exemption existed, so far as the Crown was affected. The Office of Works did not cause the height of the building to be raised.

CHIPS.

Alton parish church is about to be restored from plans by Mr. A. Crowley, A.R.I.B.A.

The annual exhibition of the antiquities, &c., found on the site of the Romano-British city at Silchester will be held at Burlington House, Piccadilly, from Wednesday June 1 to June 15 inclusive.

A contract for the construction of the new Bute dock at Cardiff has been let to Messrs. Topham, Jones, and Railton, of Great George-street, Westminster. The work will be executed at schedule prices, and the total outlay is estimated at £550,000. The contract refers to the dock pure and simple, the construction of a pier and the dredging of the channel being the subject of separate tenders.

The picturesque ruins of Birkenhead Priory have been repaired and rendered secure. The work has been carried out for the corporation of Birkenhead by Messrs. W. Haswell and Son, of that town.

A new infirmary, kitchen, and other buildings are being added to the workhouse at Chester-le-Street at a cost of about £11,000. Messrs. Crowe are the architects.

The churchyard cross at St. John's, Cardiff, which was a headless stump, has just been restored from designs by Mr. Charles B. Fowler, F.R.I.B.A., Cardiff, the architect for the restoration of the church itself. The new shaft is of Portland stone, and the head represents the Crucifixion on one side and the Ascension on the other. Mr. W. Clarke, of Llandaff, was the sculptor.

New schools are being erected at Clarence-street, Newport, Mon., and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

The new police-court erected at Castleford at a cost of between £6,000 and £7,000, was opened on Friday by Sir John Austin, Bart., M.P.

At Warrington, on the 19th May, Mr. W. Meade King conducted a Local Government inquiry into an application by the Warrington Corporation for sanction to borrow £31,933 for purposes of street improvement, £10,000 for the purchase of slot and other meters, and £700 for the purchase of a recreation ground.

The surveyor to the Ilford Urban District Council has just submitted his annual report. Plans for about 1,500 houses had been passed in the year, and the total length of new streets for which plans have been passed is nearly 14 miles.

The *Peterborough Advertiser* computes that at the present time there are something like 24 brickyards in the district of Peterborough giving employment to between 1,500 and 2,000 men and boys. Enough bricks are now turned out annually to build a very decent sized town.

An exhibition of the collected works of Mr. Clarence Whaite, P.R.C.A., R.W.S., was opened on Tuesday in the City Art Gallery, Manchester. The subjects of most of the pictures are drawn from North Wales and the Lakeland of the North.

WATER SUPPLY AND SANITARY MATTERS.

Metropolitan Water Commission.—A meeting of the Royal Commission which is inquiring into the question of the water supply of the Metropolis was held on Monday, under the presidency of Viscount Llandaff, at the Westminster Town-hall. Sir Alexander R. Binnie, engineer-in-chief to the London County Council, who was recalled, laid before the commission in tabular form various estimates of the relative cost of obtaining the water necessary for the supply of London from the Thames by means of the Staines reservoir scheme or by gravitation from Wales. The witness estimated at £10,703,570 the cost of obtaining from the Thames by the Staines scheme 114½ million gallons a day, being the difference between the total 300 million gallons of the Staines scheme, if carried out in its entirety, and the 185½ million gallons which the water companies are now authorised to take from the Thames, allowing a *minimum* flow of 250 million gallons over Teddington Weir. With a *minimum* flow of 200 million gallons over Teddington Weir the estimated cost of obtaining the same amount of water would be £10,884,805. On the other hand, the cost of obtaining the 114½ million gallons by the Welsh gravitation scheme was estimated at £10,032,750—namely, £1,850,000 for the Yrfon reserveir and head works; £6,867,500 for the construction of an aqueduct 162 miles in length, composed of 117 miles of covered conduit and tunnel, to carry 200 million gallons a day, together with 45 miles of pipe to carry the 114½ million gallons a day; and £1,314,750 for the construction of the terminal works at Elstree, exclusive of filters. The estimate which was given by Mr. Deacon for these works amounted to £9,848,000 only, but this was due to a reduction in the cost of the masonry and tunnel portion of the conduit by reason of a lessening of the daily flow to 133¾ gallons, as compared with the 200 million gallons allowed for by Sir Alexander Binnie. Another table which was handed in contained an estimate of the cost of bringing from Wales 147 million gallons a day from the combined sources of the Yrfon and the Towy, which however, could not be taken in comparison with the Staines schemes, because the Thames could not be made to yield, at any reasonable cost, 147 million gallons per day in addition to the 185½ million gallons already sanctioned. The total estimated cost of the Yrfon and Towy scheme was put at £14,112,000, comprising £2,190,000 for the reservoirs and head works, £7,760,000 for the construction of an aqueduct 162 miles in length, composed of 117 miles of covered conduit and tunnel and 45 miles of pipes, the whole to convey 200 million gallons a day, £1,911,000 for terminal works at Elstree, £1,654,750 for filters, and law and Parliamentary charges £597,250. The witness added that he had come to the conclusion that, whether the water undertakings remained in the hands of the existing companies or were transferred to some public body, that body or the companies would be ultimately driven to go outside the Thames Valley for an additional supply of water. In his view this enforced the necessity for purchase. It was highly desirable that the water supply of London should be not only uniform, but unified. By the Chairman: In addition to the amount paid to the companies for the purchase of their undertakings, the purchasing authority would have immediately to incur the expenditure involved in the carrying out the first instalment of the Welsh scheme, or of continuing the scheme for obtaining the whole 300 million gallons a day from the Thames. In the former case, the total cost would be about £21,500,000, and in the latter case it would be about £18,000,000—£7,336,375, the estimated cost of obtaining the already sanctioned 185½ million gallons from the Thames, being common to both totals. Mr. Pember, Q.C., on behalf of the water companies, subjected Sir Alexander Binnie to a long cross-examination with a view to showing that the Staines reservoir scheme would be just as effective and much more economical than the Welsh gravitation scheme. Asked to state what was proposed to be the average depth of the Welsh reservoir, witness declined to give an answer, on the ground that it might prejudice the London County Council hereafter in their negotiations with the landowners. The commission on rising adjourned until Monday, June 6.

The annual conference of the Scottish Plumbers' Association was concluded in Glasgow on Saturday, when the reports, showing satisfactory increases in membership and finances, were adopted. It was agreed to remove the general office of the Association from Glasgow to Edinburgh.

Colonel Marsh, R.E., one of Her Majesty's Local Government Board inspectors, held an inquiry at the municipal offices on Wednesday week into an application of the Southampton Town Council to borrow £28,428 for purposes of water-supply, including £19,700 for a new 24in. main from the reservoir at Otterbourne. Mr. W. Matthews, C.E., the water engineer, explained the proposals.

STATUES, MEMORIALS, &c.

Chichester. — The monument erected in Chichester Cathedral to the memory of the late Bishop Durnford, who presided over the diocese for a period of 25 years, was unveiled at a special service on Monday afternoon. The ceremony was performed by the Duke of Richmond and Gordon. The monument consists of altar tomb with moulded base and slab of Purbeck marble, upon which rests a recumbent effigy of the late Bishop in full episcopal habit, executed in alabaster. Above this is a richly-carved canopy formed out of a block of Clunch which originally weighed seven tons. Near the Bishop's effigy are statuettes representing St. Wilfred, who introduced Christianity into Sussex, and St. Richard, Bishop of Chichester. The monument, designed by Mr. Thomas Garner of the firm of Messrs. Bodley and Garner, was executed by Messrs. Farmer and Brindley, of Westminster Bridge-road, and has cost about £2,000. It is erected under the eastern arch of the south-east chapel of the nave (St. Clement's Chapel).

LEGAL INTELLIGENCE.

Heavy Failure in the Furnishing Trade.—An extraordinary general meeting of the shareholders of Messrs. Worsleys (Limited), Manchester, Bradford, and Sheffield, was held at the registered offices of the company, Manchester, on Friday; Mr. Samuel Smith (chairman) presiding. He stated that the assets of the company on paper were something like £56,000, and the liabilities, including £21,600 to trade creditors, were only some £45,000. The company could not continue in business, and he submitted a resolution urging that the company be wound up voluntarily. The resolution was carried. The shareholders appointed four liquidators, with a committee of inspection consisting of five of the principal creditors representing the Birmingham and Kidderminster trades.

CHIPS.

The town council of Stafford have given a bonus of £250 to Mr. Bell, their gas and electricity manager, for extra services rendered by him in connection with the electric light installation.

The Operative Masons' and Stonecutters' Union, of Aberdeen, have elected Mr. George Younie, of that town, as general secretary, to devote his whole time to the office, in succession to Mr. King, resigned.

At Lambeth police-court, on Saturday, Frederick Clarke, a surveyor of Elm-grove, Peckham, was committed for trial on several charges of obtaining money by false pretences, and also on a charge of bigamy.

To the collection of pictures in the Art Gallery at Oldham two portraits have just been added as gifts —one that of the Hon. E. Lyulph Stanley, formerly M.P. for the borough, the work of Mr. Sefton, and the other that of the late Edmund Hartley, mayor of the borough in 1869-70.

The nave of the parish church of Cornelly, which is in a sadly dilapidated state, is about to be restored from plans by Messrs. St. Aubyn and Wadling, of Loudon.

The directors of the New Peterborough Brick Company, Limited, have voted to Mr. F. H. Cooke, on his retirement from the post of secretary and surveyor to the company, a honorarium equivalent to six months' salary, in addition to which the ordinary shareholders have presented him with a cheque for £250 as an acknowledgment of his services to the company. A complimentary dinner was given at the Angel, on Saturday, by Mr. F. H. Cooke, to the office staff of the New Peterborough Brick Company, the foremen at the works, and several friends.

The coroner's court, mortuaries, and shelters for the board of works of the Poplar district are about to be erected from the designs of Messrs. Lansdell and Harrison, selected in open competition some time since.

The guardians of Wandsworth and Clapham Union are about to proceed with the erection of the new nurses' home at their infirmary, St. John's Hill, from the designs of Messrs. Lansdell and Harrison.

At a meeting of the directors of the Dysart and District Building Company, Limited, held on Monday, Messrs. Swanston and Legge, Kirkcaldy, were appointed architects and surveyors to the Company.

Cold Ashton Church, near Bath, has just received into position a four-light window of a very striking character, different in many respects to the treatment usually observed in stained glass. The subject is "The Baptism of Christ in the Wilderness." The window has been designed and executed in the studio of Messrs. Swaine, Bourne, and Son, Birmingham, under the supervision of the architect, Mr. Augustus Frere, Essex-street, Strand, London.

Our Office Table.

Mr. G. F. Watts, R.A., has placed at the disposal of the Trustees of the National Portrait Gallery, the portrait of Mr. Gladstone painted by him in 1865, which will be placed at once on temporary exhibition in the galleries, and will be on view next Saturday. The trustees have also acquired by purchase the original portrait group, drawn by the late Sir John Gilbert, R.A., of the Earl of Aberdeen's Cabinet, in which Mr. Gladstone held the office of Chancellor of the Exchequer. This group was afterwards engraved with considerable alterations by William Walker, the engraver, and an early proof of the engraving has also been acquired to accompany the drawing. The following portraits have also been presented to the Gallery and accepted by the trustees:—Sir John Bowring, F.R.S., painted in 1826 by John King, presented by Lady Bowring; Robert Carr, Earl of Somerset, K.G., and Robert Cecil, first Earl of Salisbury, K.G., two small companion portraits, attributed to John Hoskins, presented by Sir Henry H. Howorth, M.P., F.R.S.; Sir John Everett Millais, P.R.A., a pen-and-ink sketch, by Charles Keene, presented by Mr. Joseph Pennell; John, first Earl Russell, K.G., a full-length portrait by Sir Francis Grant, P.R.A., presented by the Duke of Bedford; Montagu Bertie, second Earl of Lindsey, painter uncertain, presented by Sir Coutts Lindsay. The following portraits have also been acquired by purchase:—Sir Henry Vane, the elder, possibly by Cornelius Janssen; Queen Catherine Howard, painted in the school of Holbein. Thomas Landseer, A.R.A., the engraver, drawn in chalks by his brother, Charles Landseer, A.R.A.; Thomas Chubb (1679-1747), a noted writer on Deism and other theological questions, a curious portrait painted by G. Beare. Edward Law, first Baron Ellenborough, painted by Samuel Drummond, A.R.A. In the cases of Mr. Gladstone and Sir John Millais, the trustees have had no hesitation in suspending their usual rule as to the expiration of ten years from the date of decease.

A series of five large circular medallions which had been let into the ground-floor wall of an 18th-century house facing Kew-green, has lately been removed, when examination showed that, instead of being mere plaster casts, as had been supposed, the medallions are original bronzes. The house had, for the greater part of this century, been let to private tenants; but it is thought that, in the time of King George III., the abutment containing the medallions was used as a tea-room for the ladies of the Court. The Queen has consented to allow the find to be shown at the present Art Metal-work Exhibition at the Royal Aquarium. Sir J. Charles Robinson describes the medallions, which are 3ft. in diameter, and of gunmetal, as very elaborate compositions in high relief, and of the most finished execution. They are of French origin, dating during the second half of the 17th century, and the subjects are representations, treated in heroic or monumental style, of actual occurrences in the career of King Louis XIV. They probably formed part of some public monument erected in honour of Louis XIV. during his lifetime, perhaps one destroyed during the Revolution. In one of the compositions the King, surrounded by courtiers, is seen present at the erection of an obelisk, the work being presided over by an important personage in ecclesiastical costume. In another the King, seated in his robes of State and crowned, is receiving the homage of a group of personages, apparently lawyers or councillors of State. In two other of the medallions the King is respectively seen entering a city at the head of a regiment of musketeers, and dismissing the captured garrison of the place. The fifth relievi represents Louis in his Royal robes, wearing his crown, and with a sceptre in his hand, apparently receiving a deputation of three ambassadors or envoys. In the background is a figure bearing a banner, on which, fortunately, is an elaborate crowned escutcheon of arms with supporters. The bearings are somewhat obscure, but they seem substantially to be those of the kingdom of Sweden. One of the envoys, moreover, is decorated with the Danish Order of the Elephant. Composition incidentally confirms the supposition as to the date of production of the bronzes, inasmuch as the two northern Powers took part in the Peace of Nimeguen in 1679. Sir J. C. Robinson suggests that they, nevertheless, may have been designs by Coysevox, Girardon, or Pierre Puget, and with equal likelihood the castings were by the brothers Keller.

The Nottingham Corporation are applying to Parliament for powers which, if granted, may have a far-reaching effect upon English fire insurance companies. The rates, particularly on electric-light buildings, have been very heavy, and in consequence the Brighton Corporation communicated with every municipal body in the kingdom with a view to have formed a Municipal Fire Insurance Union. Nottingham, however, in its Bill applies for leave to establish a fire insurance fund, which, in the event of a fire, shall be available for the purposes of rebuilding and restoring property belonging or on loan to, or in the control of, the corporation. The fund is to be allowed to accumulate to £50,000, out of which sum loss by fire shall be made good, and if by any chance the fund is diminished as a result of claims upon it, the reserve is to be again made up to the sum named.

A deputation representing the County Councils Association, the National Association for the Promotion of Technical and Secondary Education, and kindred bodies waited upon Mr. T. W. Russell at the Local Government Board on Friday, to ask that the Registration of Plumbers Bill might be so amended as to give the educational, as apart from the practical, side of the question a fair representation on the council, and place the examinations upon a definite and impartial basis. Mr. Russell said the Bill could not pass this year, so there was no immediate hurry. He suggested a conference, and the settlement of points between those interested.

Any architect or builder who is unfamiliar with the useful little treatise on "The Cause and Cure of Damp and Decay in Masonry," of which the sixth edition is issued by Messrs. N. C. Szerelmey and Co., Rotherhithe New-road, S.E., should send for a copy. Some very useful information is given for the testing of buildings for damp, and with regard to the decay of stone and the corrosion of iron. In all such cases the "stone liquid" and iron paint supplied by Messrs. Szerelmey and Co. will be found an infallible cure. They have stood the test of time, and we have repeatedly advised their use with the most complete success.

MEETINGS FOR THE ENSUING WEEK.

Wednesday.—Edinburgh Architectural Society. "Grammar of House-Planning," by J. J. Henderson. 8 p.m.

Friday.—Royal Institution. "The Development of the Tomb in Egypt," by W. M. Flinders-Petrie. 9 p.m.

Saturday. — Edinburgh Architectural Association. Annual Excursion to Alloa and Clackmannan.

THE ARCHITECTURAL ASSOCIATION.

JUNE 4th, SUMMER VISIT to Sutton Place, Guildford, by kind permission of Mr. Sidney Harrison. Meet at Waterloo Station main line) for the 1.50 train to Worplesdon. Name and P.O. for 3s. to be sent to Mr. G. A. Lansdown, 5 and 7, Warwick-street, Charing Cross, S.W.

E. HOWLEY SIM, G. B. CARVILL } Hon. Secs.

There was unveiled on Tuesday in the Scottish Conservative Club, Edinburgh, a life-size marble bust of the Queen, in commemoration of Her Majesty's Diamond Jubilee. It is the work of Mr. Birnie Rhind, A.R.S.A., who has already contributed to the decoration of the clubhouse by his bust of Lord Salisbury. The bust rests on a pedestal designed in the Louis XVI. style, and is of polished white marble, with ormolu enrichments.

Work is so far completed on the trunk line of the Trans-Siberian Railway between China and Tashkent that the rails are now being laid at the rate of nearly three miles per day, and it is possible that the first train will reach Tashkent to-morrow (Saturday).

The new offices of the Law Union and Crown Insurance Company at the corner of Clare and Marsh streets, Bristol, were opened on Monday. They have been built from designs by Mr. Henry Williams, of that city.

The foundation-stone of a new Masonic Hall was laid by Earl Jersey at Chipping Norton on Friday. Mr. A. J. Rowley, of Oxford, is the architect, and Mr. Alfred Groves the builder.

A special meeting of the Sheerness Urban District Council was held on Saturday afternoon for the purpose of signing the contract with Messrs. Fasey and Son to erect a new town pier at a cost of £12,200.

LIST OF COMPETITIONS OPEN.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2265.
FRIDAY, JUNE 3, 1898.

NEGLIGENCE IN BUILDING.

THE amount of attention that a professional man is expected to bestow upon his work, whether it be as a lawyer, a medical man, or an architect, is, after all, more or less, relative to circumstances. It would be absurd to say, for example, that a reasonable degree of care and skill is to be measured by the number of visits a professional man pays to his patient or his building. The more important, as in the case of a building, the work is, the less is the amount of personal supervision which he often gives. The circumstances are different: in all probability a responsible contractor is employed, there is a competent clerk of works engaged, so that an architect who pays a fortnightly or even monthly visit to his building may be considered to have fulfilled his obligations to his client, and to have exercised a reasonable degree of care; while in less favourable circumstances, where the low tender of an irresponsible builder is accepted and no clerk of works is appointed, the architect would be held negligent if he paid his visits with less frequency than a week. Has it not also something to do with the position of the architect? If he has attained a leading position in the profession, it would be held quite unnecessary, if not *infra dig.*, for him to visit a building frequently—his services and time are far too precious for that; nor would even a legal tribunal consider it negligence on the part of such a man if certain defects were discovered, such as bad bricks, rotten timber, or faulty drain-laying. The convenient and elastic phrase of the Courts, a "fair and reasonable" degree of care and skill would assume a rather different meaning if applied to a man of this eminence than it would to an ordinary practitioner. And we do not find fault so much with this modification, if the construction to be put on such words be applied with discretion as to the kind of work. As we have always contended, it is absurd to expect any architect to personally superintend such details as that of the bond of brickwork, the quality of mortar, whether grouting is properly done every course, or good bricks are put in the backing of walls, or that all timber is of the right sort and quality; and it is far less reasonable to expect a busy architect to do so than a country practitioner. But in matters of design or plan, of the supply of working details for certain parts of a building, the obligations of the architect are of a more precise and absolute character. If by any defect or omission in the plan failure or serious inconvenience arises, we think the architect can be held responsible. A "reasonable and competent degree of skill" would certainly be expected in the plan and construction of a building, and would be held to be as obligatory on the most eminent or busy member as on the poorest practitioner who exercised his art and calling. Business or engagements or value of time could not be pleaded as a set-off to a dereliction of duty on this ground of design, as it applies more to art and skill than a mere mechanical duty, such as that of superintendence. How far-reaching really this responsibility is will be clear to every architect. It extends not merely to plan, but to all details of construction, such as the thickness and solidity of walls, piers, columns, the design of iron girders and columns. If it can be proved that the failure of a wall or pier or girder is due to want of thickness or sectional area, and, further, that the contractor has faithfully carried out the instructions or plan, no amount of carelessness in the execution of the work will excuse the designer from his share of blame. If he pleads that soft or bad bricks and workmanship, bad casting, or want of testing, is the real cause, and such defect may have added the one straw to the load that breaks the camel's back, it cannot be set off as an excuse to the want of judgement or skill on his part. His structure at least should be sufficiently strong and stable so that it should come well within the margin of safety to be allowed. Of course, there are sometimes delicate limits. An iron girder, for instance, may be so nicely calculated in its area of section within the limits of the formula, that it would safely carry a certain imposed weight if there was no flaw or defect in the iron or the casting. The girder collapses, and it is found, on examination, that the casting was full of air-holes, or fractured in a certain part. It would seem hard to accuse the architect of the failure. In this instance the want of proper testing has led to the disaster. Or in another case which occurred lately in New York, we believe, the fall of a large many-storied building was traced to a defective fixing of iron columns. No doubt the architect could be held responsible for want of care in the superintendence of the details. The verdict in a recent catastrophe in Ontario, whereby a number of people lost their lives by the fall of a floor, exculpated the architect from blame, because the beam, composed of three or more pieces of timber, had not been securely bolted together. The sad and fatal catastrophe at Westminster brings to our mind another instance. The collapse, as reported in our last issue, was alleged to be due to a faulty pier, for which the architect has been held responsible by the coroner's jury. In this case the evidence seems to point to an extraordinary amount of carelessness on somebody's part in the supervision of the building, to the want of a clerk of works, and to a remarkable exhibition of indifference to dangerous conditions on the part of those engaged. That the pier which gave way was carried up higher than the Building Act allowed there appears little doubt. The pier was built, it is said, properly; but the astonishing thing is how such buildings can be erected in London without any control. The state of the law is such, we are told, that there is no control over certain structures like piers and girders. We commend to our readers the report of the expert evidence of Mr. Thomas Blashill, F.R.I.B.A., and that of the district surveyor. But the question of negligence stands quite independent of Building Acts and such legislation, and it is time the profession began to formulate for themselves some principle of guidance. They cannot trust in these matters to chance, or to good luck, of building and workmen, and we fear there is often a great deal taken on trust without any foundation of fact.

MODEL SPECIFICATIONS.—XV.

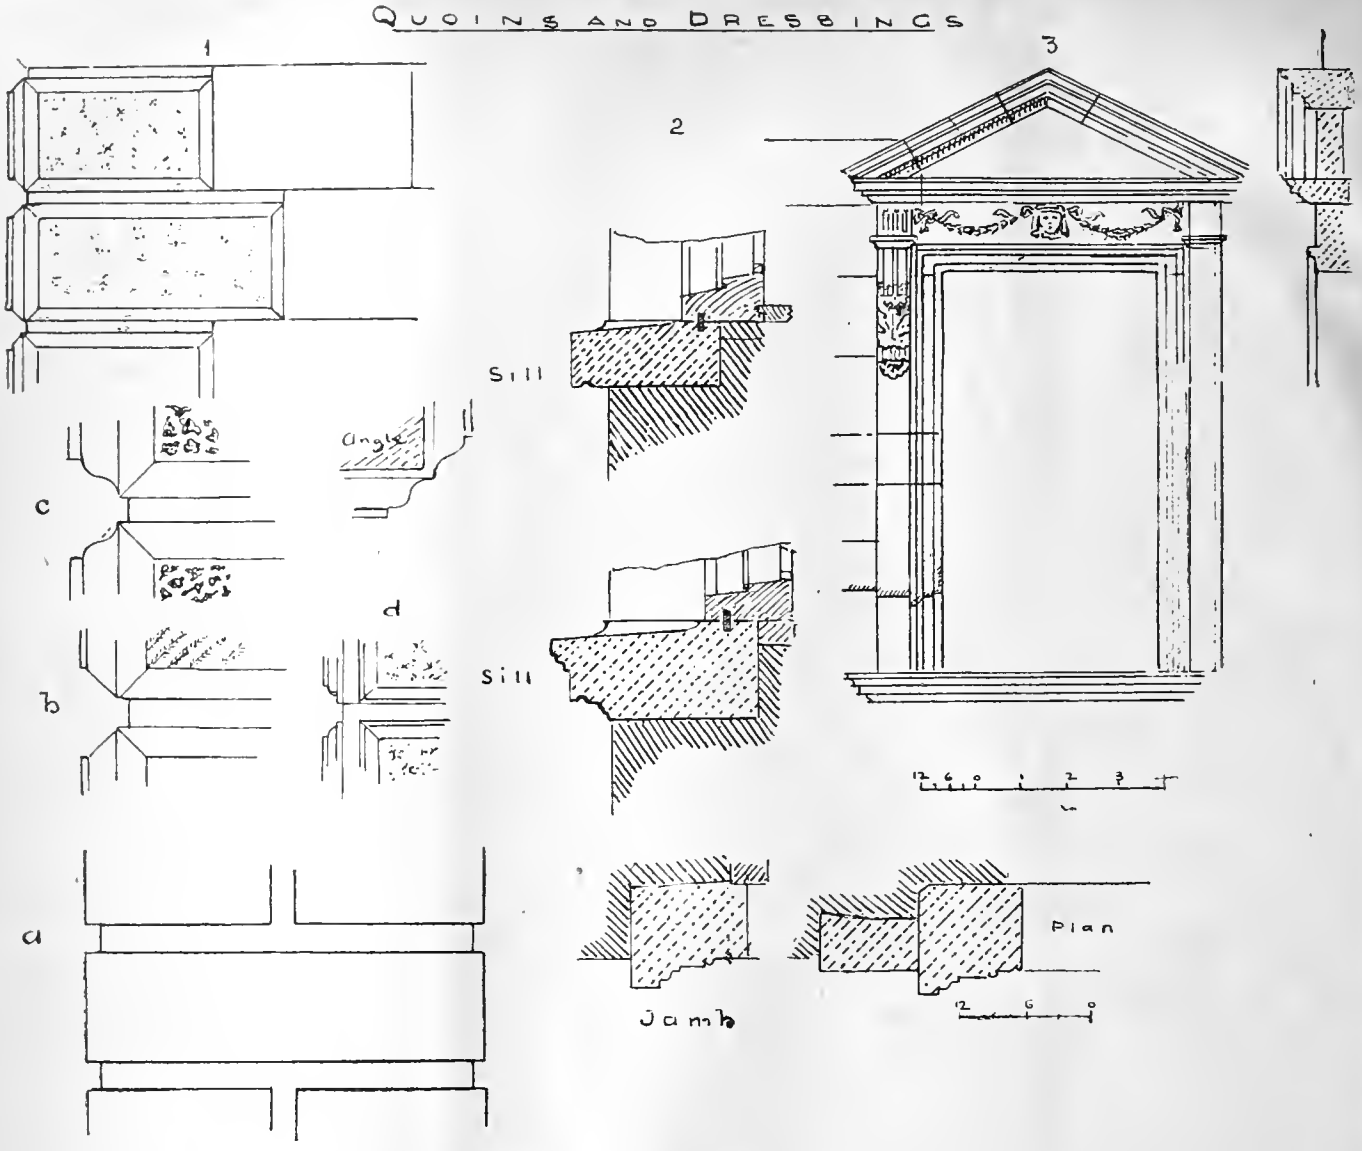
MASON.

WE now give a few clauses for stonework of a more finished character, such as quoins, sills, window dressings, cornices, and moulded work. Of course, the requirements will vary; but there are certain essentials that ought to be borne in mind. And we may here note a few points. The architect who wishes his design to be carried into execution with integrity, cannot expect the contractor to do so if he has only the small scale elevations and a short specification to go by. Nor will the scant description in the bill of quantities "including all labours," &c., suffice. A detail ought to be supplied, showing precisely what kind of "labours" have to be taken. For example, let us take such an item as quoins: unless the elevations are to a large working scale or a detail is given, how is it possible to distinguish an ordinary bevelled or "chamfered" joint from a moulded one? or how can one expect a satisfactory result? Not only is it necessary to describe the length of alternate blocks and their height and thickness, but to show the kind of edges they are to have. We give Fig. 1, four examples of plain, bevelled, and moulded edges, and the kind of hammer-dressed or rock surface required. These quoins may be simply raised blocks, with channels between as at *a*, which represents a pier, or blocks with bevelled edges, hammer-dressed, or vermiculated on face, or moulded as at *c*. Sometimes the angle of wall face is solid and continuous, and the blocks are merely raised as shown at *d*, which may be considered preferable, though not so bold as in *b* or *c* (see plan of angle). The joints of the blocks are better made in a line, with the upper projection as we show in our sketches, the channel being sunk below it, as this plan protects the joint. With the simple bevelled edge the joint can be made in the centre between the two bevels.

Several kinds of tooled work for quoins are used. The punched "rock" face with tooled margin, is bold and effective, a number of cavities is produced by the punch, as shown in Fig. *b*. A "broached" face, Fig. *c*, is produced with a "point," and forms a series of straight furrows and rough ridges in a diagonal direction between chiselled margins. The "rusticated" face and tooled margin is a more frequent mode of finishing quoin stones (see Fig. *d*); it is worked by small chisels and points, and ½in. deep irregular cavities are formed, leaving a plain, narrow margin on the face. The "vermiculated" face *d* is cut with small chisels into cavities having a worm-eaten effect.

In the specification of sills, jambs, and architraves, care must be taken to give the sizes or scantlings of stone if not figured on drawings, to describe if the sill is sunk, weathered, and throated, how much longer it is to be than the opening and jambs, if there are mitred and returned ends, and consoles. Sills are generally seated to receive the jambs; these seatings are moulded to the profile of jamb or mullion of stone or brick, as we show in our sketch 11, p. 697, and a slate or copper dowel is inserted to prevent displacement. Mortises are cut opposite each other in the two beds for the dowel, which is then run in with cement. It is necessary to avoid joints in a window-sill under the opening, and they ought to be properly set in cement mortar.

We show also a few Classical window dressings. The architraves or jambs should be made to course with the ashlar or brick facing. In ashlar fronts the stones of the architraves are often of considerable heights of 3ft. or more, and the number ought to be specified to each jamb, and if bonded into a course of ashlar or walling every two or three courses. The stones ought to be dowelled together with slate or copper. To cover the joint between the facing of wall and architrave the stones are rebated sometimes, and also for the wooden frames. The section of cornice we give shows how the stones may be fixed or tailed into the wall. It is necessary to state the depth of bedding, whether the stones are dowelled or plugged with lead or cramped together, and if with metal or slate cramps run with lead or cement. Sulphur and sand or brimstone is better than lead to fix iron or metal cramps. The projection of cornice should be given, and how it is to be counter-weighted or held down by iron bars (see sketch). These bars should be 2in. or 3in. wide and ½in. in thickness, with the ends turned into stone above or the brickwork below. Sometimes bars pass through holes in the stone and



brickwork, and are secured by nuts and plates in the wall, filled up with cement. The distance apart of these hold-down bars should be specified.

21. *Ashlar Facing.*—The ashlar facing to consist as nearly as circumstances will admit, of courses 12in. or 15in. high, formed with headers having a horizontal bed of 1ft. 6in. by 12in., and stretchers having a horizontal bed of 3ft. by 5in., the quoin stones being in no direction less than 1ft. 6in. on their bed. All horizontal joints to have a slight chamfer on the upper edge of each stone.

We have given a clause for quoins, p. 698 (clause 6). Here are one or two more.

22. *Quoins.*—The angle-quoins to be worked as shown in detail, with bevelled (or moulded) edges. The projecting faces to be 1½in. (or 2in.) beyond surface of wall, and to be hammer-dressed (or vermiculated), and the channel or grooves to be sunk below the joint of upper bed. The blocks to be alternately 15in. and 9in. (or 18in. and 12in.) in length, and 9in. or 12in. in height, and bond with the courses of ashlar. Or—

The angle-blocks of main front to be finished with roughly-wrought (or tooled, or punched, or rusticated faces) with chamfered (or moulded channels), and to be of the lengths, heights, and sectional form shown and figured on detailed drawings, two quoins being cut out of one stone, as shown in sketch.

23. *Sills.*—The windows of ground and first floors to have rubbed Portland stone sills 9in. by 6in. (or 9in. by 4in.) sunk, weathered, and throated with fair ends grooved for iron tongues. Or—

Put Portland stone window sills 14in. by 4in. to the windows. All the sills to be 4in. longer than the width of opening, and grooved for metal tongues, and to be in one length. The sills and projecting stonework to be cased during the progress of work, and cleaned off at completion. Or—

Put to all windows 9in. by 3in. rubbed, sunk, weathered, and throated Yorkshire sills 4in. longer than openings, with stopped ends grooved for iron tongues, and with stools worked on for mullions and reveals.

24. *Moulded Sills.*—To put to windows of principal rooms finely-wrought and rubbed Portland stone sills 12in. (or 14in.) wide by 6in. thick (or moulded as shown), sunk, weathered, and throated and tongued. The sills to be 4in. (or 6in.) longer than the width of opening (and jambs). Moulded trusses to be placed under jambs.

25. *Jambs.*—The doorways (or window openings) to have architrave jambs of solid Portland or other stone, moulded, of scantling shown in sketch. The jambs to be in two (three, or more) stones, and to be properly set and dowelled to stone sill (or plinth). The jamb to be rebated on its outer side. Proper bond to be obtained by varying the depth of stones. The lintel to be of one stone. Or—

Put to the doorway architrave jambs 9in. by 6in. (or as drawing); the jambs to be in three (or more) stones, dowelled together with copper (or slate) dowels, and bonded into wall. The stones to extend from face of wall to face of frame and the back of frame alternately. The outer mouldings of architrave to be rebated 1in. over wall face. The entablature to be of two or three pieces in depth, as shown on detail; the frieze to be not less than 6in. on bed, and the cornice above of the scantling shown in section, or 9in. or 12in. projection, tailed into wall 9in. or 12in., moulded as shown, and jointed in three pieces, with mitred returns, &c.

26. *Window Dressings* (see sketch 3).—The windows of —— to have moulded sill, architrave, and pediment, as shown of the several scantlings and projections shown in detail. The window-sills to be finely rubbed, moulded as shown, and sunk, weathered, and throated (or specify dimensions, say, 14in. or 18in. by 6in. or 9in.) and to be 4in. (or 6in.) longer than the opening and jambs, in one (or more pieces) with mitred returns. The jambs or architraves to be of solid rubbed Portland (or other stone) each in three (or four) pieces, bonded to wall and dowelled to sill. The entablature and pediment to be moulded, as shown, and to be of the scantlings given, the architrave and frieze to be solid, in separate or single stones. The pediment to be formed of stones tailed into wall 6in. (or 9in.), and to be jointed as shown, or in five pieces dowelled together with slate in cement. The tympanum to be of three stones 6in. in bed. Or—

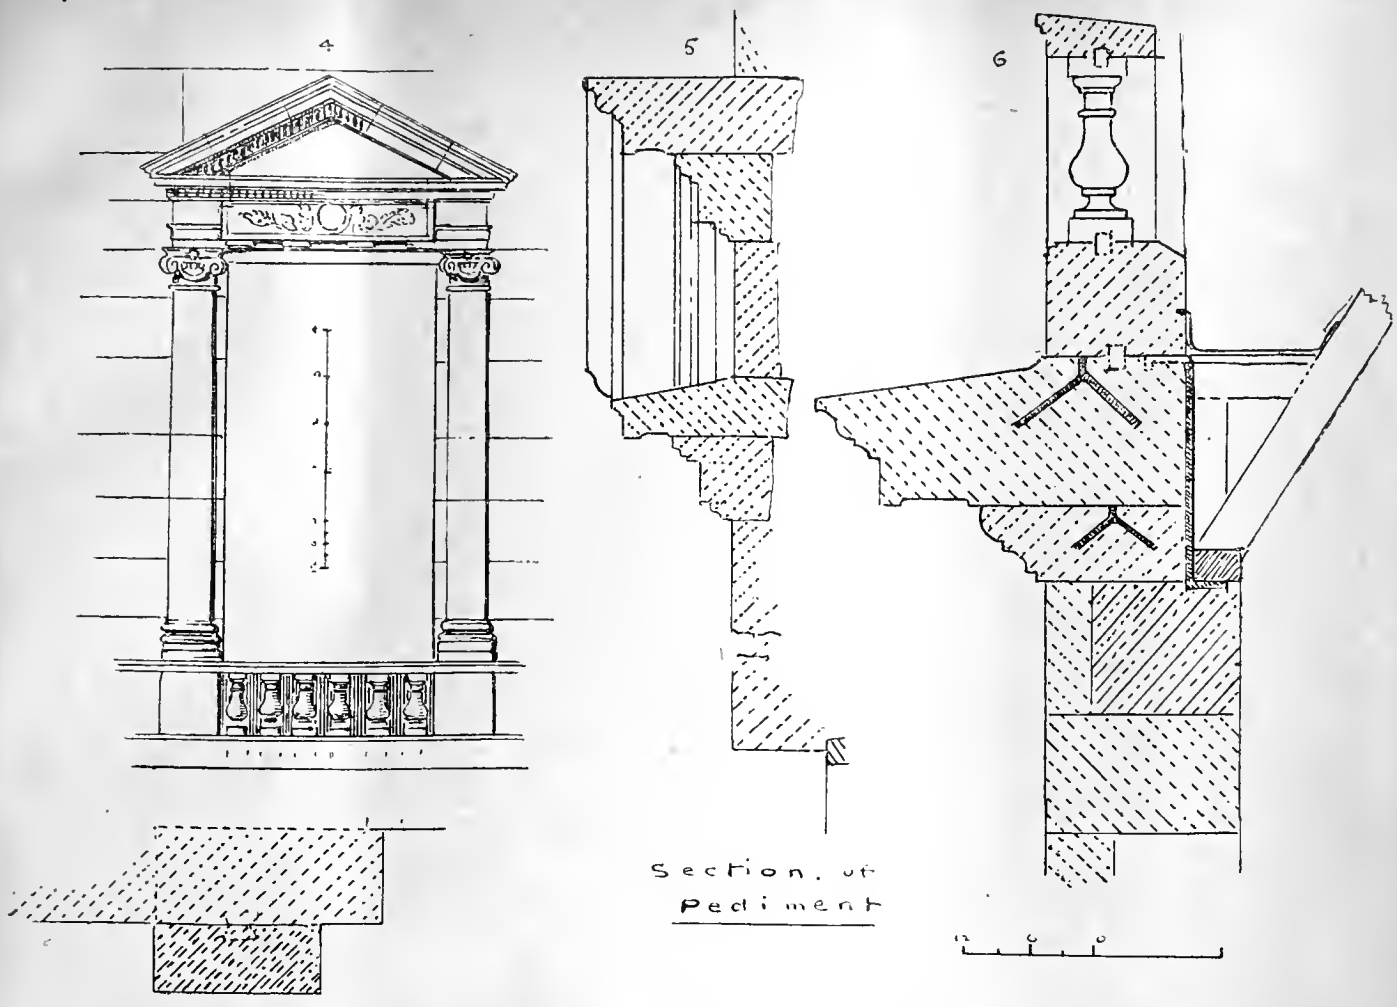
The sills to be of rubbed Portland (or —— stone), weathered, throated, grooved, and moulded, returned and mitred ends, with stools for jambs (or mullions) worked on, with copper or slate dowels and grooved for iron tongues 1½in. by ⅜in. The moulded architraves to be as shown, to be in courses with the ashlar, every fourth jamb-stone being bonded through the whole thickness of wall, rebated to receive frames. (If there are mullions—)

The mullions or pilasters to be of the size shown (or 6in. on face by 9in. deep), moulded (or panelled) as shown, rebated to receive frames, and in three (or more) pieces, and dowelled together. Or—

The window dressings or jambs to be rusticated with chamfered (or moulded) joints as per detail, in courses with ashlar facing, rebated for frames, and bonded every three or four courses to wall: and the flat or curved arch to be also of rusticated stone in five pieces (or jointed as shown) with skewbacks.

27. *Plain Cornice.*—The cornice (see section 6) to be built up in two (or three) thicknesses of Portland stone, in lengths of not less than 5ft., cramped at joints with copper (or galvanised iron cramps 12in. long). The beds to be as shown in section (or give depths, or the stone to be bedded through the thickness of wall). The upper projecting course of cornice to be bedded through wall and to project 18in. (or more) from face of wall, weathered, moulded, sunk, and throated, as shown. Or—

The cornice to be in two thicknesses of stone in lengths of not less than 3ft. (or 5ft.), the lower or bed-mould course to go through thickness of wall (14in. or 18in.), and to be moulded, as shown, and project (6in.) The upper member to



project 18in. (or more) from wall face and to go through wall (or to have a bed of 1in.) The courses to be cramped at joints with copper or galvanised iron cramps, and wrought-iron holding irons are to be fixed, 4ft. long, 3in. by ½in., as shown, every 5ft. apart, and the lower end turned into walls 6in. (or under plate), and the upper end turned down into stone of cornice.

28. *Cornice and Balustrade.*—The cornice to be of Portland (or other stone), free from all defects, in two (or three) courses of the sectional form, and scantlings shown in details; no stone to be less than 5ft. (or 3ft.) in length. The enriched lower course to have modillions (or dentils) as shown, and the soffits to be sunk and panelled. These enrichments to be carved out of the solid stone, after full-size models approved by the architect and to his satisfaction. The plain parts to be rubbed (or dragged, or tooled). The main courses of cornice to go through the whole thickness of wall (or state depth, 12in. or 18in.), and at every 5ft. a flat galvanised wrought-iron bar, 4ft. long, 3in. by ½in., to be fixed with turned ends, one into the stone and the lower one into a course of the brick wall to hold down cornice. The stones to be cramped with copper or galvanised iron cramps. Fix above cornice a blocking course 12in. high and 9in. on bed (or a balustrade with plinth balusters and capping to be fixed, properly cramped and dowelled together as shown in detail. All the parts to be solid, and of the form and scantling shown. The plinth and capping to be in stones not less than 3ft. (or 5ft.) long, cramped together with slate (or copper) dovetail cramps, and each baluster to be dowelled to plinth and capping with copper or slate dowels in cement.

29. *Copings.* — Put weathered (or saddle-back) Yorkshire copings, 13in. (or 18in.) by 3in., throated on both sides, to all parapet walls, in lengths of not less than 5ft. each, with stopped ends and angle-stones. The stones to be bedded and pointed in cement, and cramped together with slate (or copper) cramps. The gables are to have apex stones, kneelers, and bonders as shown. Or—

Put Portland stone coping, 16in. by 2½in. (or 18in. by 3in.), to all parapet walls, and gables (weathered or saddle-back) with returned angles, apex stones, kneelers, and bonders jointed in cement, and cramped with galvanised iron (or copper or slate) cramps in cement.

THE ARCHITECTURAL ASSOCIATION DINNER.

THE annual dinner of the Architectural Association, marking the close of the fifty-first session, was held on Thursday evening in last week at the Holborn Restaurant. Mr. Hampden W. Pratt, F.R.I.B.A., the President retiring from office, occupied the chair, and among the eighty or ninety members and guests present were Dr. Garnett, Messrs. W. D. Caröe, F. E. Hulme, Beresford Pite, W. A. Pite, G. H. Fellowes-Prynne, E. Fellowes-Prynne, H. Fellowes-Prynne, H. T. Hare, W. H. Jamieson, F. W. Pomeroy, W. G. B. Lewis, A. S. Flower, A. G. R. Fenning, F. G. F. Hooper, A. O. Collard, A. Hessle Tiltman, Clarke Edwards, E. O. Sachs, E. A. Runtz, F. R. Farrow, J. G. N. Clift, A. W. Weedon, H. Lovegrove, A. T. Walmisley, H. Tanner, F. T. W. Goldsmith, W. J. Loeke, F. H. R. Hardcastle, H. A. Satchell, D. G. Driver, &c. The after-dinner speaking was interspersed by songs from recent A. A. burlesques, excellently rendered by Messrs. F. D. Clapham, S. Constanduros, J. H. Wilson, G. B. Carvill, and Leonard Butler, and Mr. F. Imhof acted as accompanist.

The health of "The Queen" having been duly honoured, the PRESIDENT proposed the toast of "The Royal Institute of British Architects," remarking that for many years they had deservedly placed this in the forefront of their toast list. He proposed to put before them the Institute in one or two aspects—first, as that body was regarded from outside its ranks, and then as considered from within. In certain Government and other official circles, the Institute seemed to be looked upon as being at the head of the profession, and there was no doubt this was the right place for it to occupy. So far, however, as the general public was concerned, it was doubtful how far the Institute, or for that matter, the whole body of architects throughout the country, were recognised as they ought to be. Within the profession there were many able men who were outside its ranks, and personally, he held this to be a misfortune, not only for the Institute, but for the profession at large. So long as this was the case, architects were not able to speak with that united voice and authority they ought to command. He should like to see the Institute universally acknowledged as the one representative body of the profession. For his own part, he could never understand what position another society, which he would not more definitely name, held among architectural bodies, but he hoped the time was not far distant when the society he referred to would dissolve itself and throw in its lot with the Institute. He would next ask what were the views of those within the Institute ranks. Undoubtedly many architects considered that the Institute might do a good deal better than it did at present, that it might be much better than it was, and there was a feeling abroad that considerable alteration was needed in the constitution of its council. [Hear, hear, and applause.] It was a sign of these democratic times that such a feeling should exist, and that a certain amount of reform in the council by whom it was governed should be demanded. The allied societies in the provincial towns, however, looked up to the Institute as if it were on a pedestal, and regarded it as exercising considerable benefit for the whole profession, while they also did not forget that they constituted one of the elements of the Institute's power and influence. Passing on to consider the Association's point of view of the case, the two bodies had recently been in closer alliance than when he first joined the Association, and the closer union had been of mutual benefit. For some years the Association had been represented on the Council of the Institute, and for a considerable period they had received from the Institute an annual grant of £100 towards the expenses of the classes. This sum they had not scrupled to accept, as they regarded it as money which eventually found its way back to the coffers of the Institute in the form of new Associates trained in the Association classes. He felt no doubt that the success of the Institute examinations had been materially aided by the systematic course of training given at the studio in Great Marlborough-street, and if they did not agree altogether with the manner in which those examinations were conducted, they gladly acknowledged that considerable benefits had resulted therefrom. They

ought to work hand in hand with the Institute, and endeavour to make these examinations more useful to the student. In the regrettable absence owing to ill-health of Professor Aitchison, the President, who had written expressing his hope that they would enjoy themselves with the usual hilarity, he would couple with the toast the name of Mr. W. D. Caröe.

Mr. CAROE, in reply, expressed regret at the absence of Professor Aitchison, who at the Institute council meetings always contributed some of his brightness and mirth to that somewhat dreary body. The present was not an occasion on which to talk architectural politics, and he would only say that the Institute as a body, and more particularly as represented by its council, felt that its life-blood ran in the veins of the Association. It was a truism that youth was the hope of old age, and certainly the Association was the hope of the Institute. The more cordial feeling existing between the two bodies was of immense advantage to the profession, and also to each body. What was most to be dreaded by architects was a lack of enthusiasm. There were so many turmoils and difficulties surrounding the practice of their profession, that the time and labour required to organise and keep going societies was a serious matter, and hence they constantly required to have new blood and fresh ideas grafted on to the old. He concurred in all the chairman had said as to the need for reform in the council of the Institute. It ought to be a rotatory body, members retiring from office after two years' service, and then, after at least a year's absence, being eligible for re-election. He had been struck at the Academy Exhibition by a model design for a church, executed by a member of that Association who had been trained in their classes. It was on men of this stamp, and on those at the head of the A.A. schools, that the future of the Association and of the profession depended.

Dr. GARNETT proposed the toast of the evening, that of "The Architectural Association," in a speech characterised by much dry humour. As an outsider and layman, he disclaimed any intention of discussing its internal affairs; but he knew it was carrying on a most valuable, efficient, and important work. Not only did it prepare students for the R.I.B.A. examinations, but it also organised an invaluable form of post-examination teaching in design and water-colour drawing, such as could not be found elsewhere, and it conducted practical classes in the properties, uses, and limitations of materials, thus training the younger men to use tools as well as pencils. A still more beneficial work, educationally, in his judgment, was the fortnightly gatherings—meetings for mutual improvement, which was the best kind of improvement. Not only did they read papers to each other, but occasionally papers were read before them by experts—papers of a class which could not be got at any cost from any other source. Any young architectural student coming to London would do well to join the Association, for he would gain moral as well as intellectual strength in its classes and meetings. The Association was worthy of the admiration of all, and he would ask them to drink to its continued health, prosperity, and success, coupling with the toast the name of their hard-working President, Mr. Pratt.

In acknowledging the toast, which was received with enthusiasm and musical honours, the PRESIDENT observed that Dr. Garnett had seized on the real vital point of the reason for existence—no other name than that of the Association would so well express the aims and endeavours of that body. Their object was to work together as a band of young men, associated for mutual help and with a common desire to advance the art they loved. It would be a deathblow to the Association if this bond of union—that of mutual help—were broken. The cause of technical education was advancing so rapidly and steadily that the Association, if not threatened in its existence, was at least put on its mettle, and they must endeavour to draw the bond of union closer and closer in order to demonstrate to the student the advantages of joining their ranks. Mr. Caröe had referred to the need for enthusiasm, and this was certainly not lacking in the Association. Having referred to the remarkable Jubilee gathering of last year, the President observed that one of the matters discussed on that occasion was the necessity that existed for providing more commodious premises in which to conduct the classes. It might be thought that the day was far distant when something would be accomplished in that direction; but he believed that ultimately their desires would be realised. At present the committee were seeking a site, and were taking practical means to that end. The Association was maintaining its financial position, and the result of the last twelve months would be held to show a better balance-sheet than for many years past.

The next toast, that of "The Lecturers and Instructors," was proposed in an eloquent speech by Mr. BERESFORD PITE. The subjects of the toast were, he said, practically those friends who filled up the gaps in the patriarchal system of haphazard self-education of the pupil which prevailed in architects' offices, a system under which the luckless youth was left to pick up his knowledge of the profession—something after the style of a fowl picking up grains in a farmyard. For the present educational system of the Association they owed thanks to their past-president, Mr. Leonard Stokes, who was the originator of the new curriculum; but although the speaker sat on the original committee, he for one never anticipated the outside support they now possessed in the form of their excellent body of instructors and teachers. The Association had for many years provided examinees for the R.I.B.A. examinations, but not the examiners. Now, however, the position was altered, and he hoped before long the Association would be represented on the examining board. What the profession owed to Mr. F. R. Farrow and his colleagues could not be lightly estimated. The quantity surveyor instructed the students how to cook, without any intention of making them quantity surveyors themselves. As to the other instructors who were not trammelled by the awful bogie of examinations, the young architect would find that every point he acquired with regard to practice and design would afterwards give an added joy to existence. A cynical friend had suggested to him that one necessary class had been altogether omitted from this curriculum. A man might have his head chock full of technical facts and figures, and his fingers might ooze with technical skill, and yet fail to attain to any success in life. The ultimate thing that succeeded in life was not knowledge but cheek; and therefore he thought it would be most desirable if some benevolent person would establish a professorship of Pure Cheek in our technical schools and universities; were this accomplished he ventured to think that architects might be found to fill a few chairs.

Professor F. E. HULME, F.L.S., whose name was associated with the toast, briefly replied, referring in the course of his remarks to the Royal Palace at Kew, about to be thrown open to the public, and which he hoped would be maintained in its present condition, and not allowed to degenerate into a mere addition to the many museums in Kew Gardens.

Mr. F. R. FARROW also acknowledged the toast, remarking that the Association was founded on principles which must bring increasing success to the school. Whenever they obtained the promised new premises, he hoped the buildings would be more soundproof than the present studio, although in this respect 56, Great Marlborough-street was an improvement on 9, Conduit-street.

Other toasts were "The Visitors," proposed by Mr. A. H. HART, and responded to by Messrs. HARE and LOCKE; and "The Committee and Officers," given by Mr. ALFRED CONDER, and acknowledged by Messrs. GOLDSMITH and HOOPER, who are retiring under the rules after three years' useful service. The concluding health was that of "The President-Elect," proposed in a felicitous and humorous speech by Mr. BANISTER FLETCHER, and having been received with musical honours, was acknowledged by Mr. G. H. FELLOWES-PRYNNE, who observed that he felt the responsibilities of his position, following as he did in the wake of such able men as his genial friend Mr. Mountford, their admirable leader Mr. Caröe, their orator Mr. Beresford Pite, and last, but not least, their most truly businesslike chairman Mr. Pratt. As architects, the one great thing they needed was *esprit de corps* and brotherhood, and these they would find in the ranks of the Association.

A new county-police station is in course of completion at Broadstairs, from plans by Mr. F. W. Ruck, of Maidstone, the county surveyor. The contractors are Messrs. A. N. Pryer and Co., who have also just enlarged the police-station at Sheerness also from Mr. Ruck's plans.

THE SOCIETY OF ARCHITECTS.

A SPECIAL general meeting of the Society of Architects was held at the rooms of the Society at St. James' Hall, Piccadilly, W., on Thursday, May 26, at 8 o'clock p.m. Major F. S. Leslie, R.E., Vice-President, was in the chair. Mr. ELLIS MARSLAND, honorary secretary, briefly stated the object for which the meeting had been called, and then moved the following resolution, of which due notice had been given:—"That the Article of Association 11 A be amended in the following manner: (1) By deleting the figures 35 in subsection A of the said article, and substituting the figures 28 in lieu thereof. (2) By deleting the figures 35 in subsection B of the said article, and substituting the figures 28 in lieu thereof."* This was seconded by Mr. R. W. COVENTRY DICK. At the conclusion of a speech of some length, in which he criticised the action of the council, Mr. G. A. T. MIDDLETON, A.R.I.B.A., moved the following amendment:—"That the lowering of the age limit for the admission to membership of this society without examination being, in the opinion of this meeting, a retrograde step, and not calculated to improve its position, the Council be instructed to carry out the spirit of the whole of the provisions of Article of Association 11 A." This amendment found no seconder, and therefore fell to the ground. Mr. G. A. T. MIDDLETON then moved, as a further amendment, "That the limit of age be altered from 28 to 32"; but this also found no seconder. The chairman then put the resolution, which was carried, there being only one dissentient. This concluded the proceedings.

At the conclusion of this general meeting, the seventh ordinary meeting for the session 1897-98 was held, Major F. S. Leslie, R.E., vice-president, occupying the chair, as before.

Various donations to the library of the society were announced, and acknowledged with thanks.

Mr. CECIL TUDOR DAVIES, librarian of the Wandsworth Free Public Library, read a paper on "Libraries from a Librarian's Point of View," which we hope to give in an early issue. A short discussion followed, in which the Chairman, Messrs. Ellis Marsland, J. R. Manning, and G. A. T. Middleton took part, and a vote of thanks was accorded to the lecturer.

* The present conditions for membership of the Society, which it is proposed to alter by these changes, are: On and after November 1, 1896, election to membership will be only open to candidates, approved by the Council, who have passed an examination, with the following exceptions: (*a*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits, as principals, for at least seven years; (*b*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits, as assistants, or as assistants and principals for at least ten years. All candidates seeking election into the Society of Architects will, with the exceptions previously noted, be required to satisfy the Council that they possess a competent knowledge of architecture, building construction and materials, and modern practice.

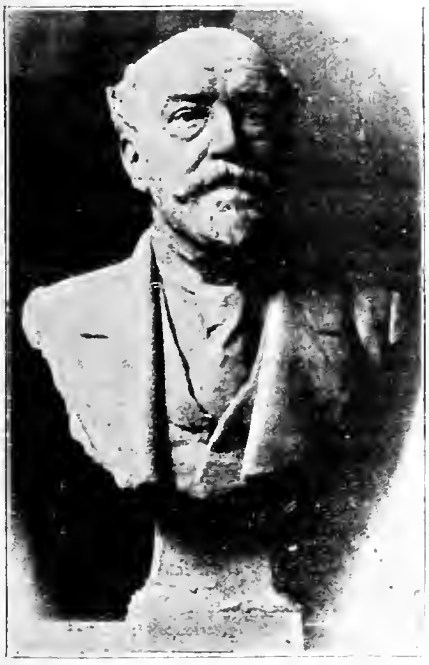
A CASE OF JURISPRUDENCE IN LAND-SURVEYING.

MR. AMBROSE E. LEHMAN read a paper on May 21 before the Engineers' Club of Philadelphia upon the above subject. With the aid of a blackboard sketch he described the character of a survey of a large and valuable tract of land in a neighbouring state. This survey was made under a contract substantially as follows:—It was to include: (1) The establishment of a true north-and-south line at some suitable point on the property. (2) The survey of the outside boundary-line of the property, including the outlying lots. (3) The location of all houses, buildings, &c. (4) The principal features of the topography as far as the same are incidental to the surveys above mentioned. (5) A finished map of the whole work in all its details, on a scale of not less than 6in. to the mile. The main tract was eleven miles long and about four miles wide, and of such irregular shape that its circuit measured about 44 miles. It was soon found that the courses and distances in the deeds of record on file in the county office were inaccurate and misleading and were lacking altogether. There was no record of the date of the original surveys, nor any notice of magnetic variation at that time. The property itself was next explored in detail, and the country was found to vary from low, swampy lands to sudden and extended elevations. Three lakes of considerable area and several ponds of varying size were included in the tract, and for the most part the country was

thickly wooded. Deposits of rich magnetic ores were distributed here and there throughout the entire region, and it was soon discovered that their influence would be felt in the form of local attraction generally throughout the territory, and this became a serious and important factor in the work. In due course the work was accomplished, the whole undertaking having consumed over a year's time. A total of over 300 miles of line had been run, surveys were calculated, acreage estimated, and a map drawn, being in scale slightly larger than the contract specified, and in all its features fulfilling the requirements. The map, when finished, was promptly delivered to the company, with a report describing at length and in detail the work that had been done, and causes for the various delays in arriving at final results. A request made at this time by the engineer for a final and full settlement according to contract was refused, with the reply on the part of the company that no further payments would be made, for the following reasons:—(1) That the delivery of the map and results of the work were unreasonably long delayed, and had caused disappointment and embarrassment to the company. (2) That the lines run did not show on the ground the actual boundaries, and were misleading as to where the true lines of the property really stood. (3) That the contract bound the engineer to lay down on the ground the actual and true lines from corner to corner, after he had ascertained their position, by setting stakes and cutting a vista through the forest and underbrush. (4) That the true north-and-south line established on the property did not show the magnetic variation of the locality. (5) That where no corners were found, whether they had become extinct by natural causes, destroyed or removed to wrong positions, the engineer should have restored them to their proper place. (6) Though the map furnished was an artistic piece of work, bearing evidence of care and precision in its construction, and in all probability accurate at all points, yet it merely showed, theoretically, where the lines of the property were, and would not serve as a guide by which they could be traced on the ground. (2) That all notes, notebooks, plots, papers, calculations, &c., of whatever nature, incident to the prosecution of the surveys, rightfully belonged to the company, and were wrongfully retained by the engineer. In the engineer's protest against such an unjust view of the situation, he replied that the delay was caused by the difficulties encountered in the work, which were entirely beyond his control, and that the thorough methods employed required time and every precaution to guard against error and hasty conclusion, while in the end all were for the company's benefit, and made at a constantly-increasing expense to the engineer; that he was not legally bound to lay down the lines in their true position and cut a vista through the forest, which would have necessitated the doing of the work over again at almost the same cost of the original surveys; that a line had been staked out astronomically north and south, but, due to the local attraction, the angle of magnetic variation could not possibly be ascertained within reasonable time and expense: that where corner monuments were missing, because of the doubtful authority conveyed by the records, the engineer was not bound to restore them, and had he done so without an agreement between adjoining property-holders, he would have assumed judicial functions clearly foreign to his duties: that the map furnished the company was an exhibition of the exact conditions found on the ground, and the topography indicated would point to indestructible landmarks by which the boundaries could be traced; that as the whole work was done by contract for a stated sum, the engineer was bound to furnish only what his agreement called for: and he held that his methods and records belonged to him as long as results given were accurate. This appeal of the engineer, in the end, brought about settlement in accordance with the contract; and when the balance due him was paid, and all salaries, wages, and expense accounts deducted, he found, in confirmation of his fears, that he had lost seriously on the work. In closing, the author stated that however prejudiced our view might be in favour of the contention that the engineer could only fulfil his contract by restoring all boundary lines as originally surveyed in harmony with the courses and distances as given in the deeds of conveyance, yet such a view of the case must certainly allow the engineer, on his part, to demand that his employers provide him with a correct record of the field-notes of these surveys, showing where every position was taken by the instrument used, its character and equation, the length of every sight, &c.; for without this exact data it would be manifestly impossible for him to reproduce the original results or lay down the lines as they were before all signs of their position had disappeared.

PROFESSOR BANISTER FLETCHER.

IN connection with our notice of the Art Metal Exhibition at Westminster we reproduce the bust of Professor Banister Fletcher,



PROFESSOR BANISTER FLETCHER, V.D., F.R.I.B.A., J.P, D.L.

(J. NESFIELD FORSYTH, *Sculptor.*)

to whose exertions, as chairman of the council, the success of the arrangements has been mainly due.

The bust is by Mr. J. Nesfield Forsyth, and is in this year's Royal Academy.

ART METAL EXHIBITION AT THE ROYAL AQUARIUM.

ONE of the best and most complete collections of art metal-work of ancient and modern times has been opened at the Royal Aquarium, Westminster, and is well worth the attention of all architects and art craftsmen. The incompleteness of the stands and the catalogue make it necessary to pass lightly over some of the exhibits. The ground floor of the hall is occupied by several large and important stands One of the most conspicuous specimens of wrought ironwork is the pair of wrought-iron carriage gates exhibited by Messrs. Lindsay, Neale, and Co., Ltd., of North Wharf, Paddington (Stand No. 33). The design is bold, and the workmanship of high-class character. The gates are surmounted by a very effective ramped and scrolled head, in which the broken curves of Italian Renaissance character form structural lines, connecting the smaller scrolls. Bold acanthus foliage hammered out gives shadow and firmness to the curved bars. Below this is an open frieze of scrollwork. The main panels of the gates are ornamented by centre scrollings and leafage of beaten or embossed iron, which form oval-shaped medallions, enriched by floral devices of the rose, shamrock, and thistle. The rectangular bars of the gates also terminate at top and bottom with leafage and scrolled ornament, arranged so as to strengthen the rivet connections with the main framework. Each gate has side open-work pilasters, which give variety and structural character. The specimens of railing and staircase panels and wrought-iron sashes are also deserving attention, both for design and craftsmanship. As an example of artistic metal-work, the hammered-iron lily and leafage can hardly be surpassed. A very useful class of exhibits in the hall is that illustrating metal casements. Messrs. Burt and Potts, of York-street, Westminster, have a model of a three-light mullioned window, fitted with their well-known wrought-iron and cast gun-metal casements and windows. These are made to open either inwards or outwards. The grooved and flanged bar sections are so made as to form an effectual barrier to rain; the double-grooved section is admirably adapted for this purpose. These casements are hinged at the sides, or are pivoted vertically near the centre to allow of the outside of casement being cleaned. The upper lights are also arranged to open partially inwards, and the opening bars, fastenings, and adjustments are made to allow the blind to be drawn down without hindrance by the usual projecting arms—a very great advantage over the ordinary casement apparatus. One of the casements and upper lights is filled with a very artistic design in leaded glass.

Mr. Henry Hope, of Lionel-street, Birmingham, has also, in Stand No. 31, a number of his excellent metal casements, hinged both at side and at top to open outward, and a casement which swings on pivots not quite in centre for cleaning purposes. These are fitted with gunmetal condensation channels at the bottom formed of two grooves. The sections of bars are designed to give a watertight security. The swinging casements with screw-gear also exhibited appear to be all that can be desired. We notice, too, a very interesting case of ornamental latches of forged iron, some of them copied from old examples in Warwickshire, Sussex, and Surrey; also some very nice gunmetal handles and latches of excellent design and workmanship. The factory sashes of rolled iron bars with a middle light which falls inwards, and can be adjusted on quadrants with movable stops, is a very useful and desirable improvement on the forms usually seen. A very artistic effect is obtained in one of the small casements by the leaded light with colours obtained by selected Norman glass. The pattern, a conventionalised pomegranate, is exceedingly effective and simple.

The N.A.P. Window Co., Ltd., Victoria-street, Westminster, have a very large stand (No. 38) in the east section of hall. The N.A.P. sashes and casements of metal and wood hung to open inward or outward, or both, are well known to the profession, and we can simply advise our readers to pay the stand a visit. They will there see every kind of sash and casement fitted and in action. The "slip-tongue" and "double-knuckle" metal casements which open in and out are specially deserving of notice. The company show several patented arrangements of metal casements, which open outwards for ventilation and inwards for cleaning, also the N.A.P. sliding and revolving sash for cleaning, which can be adapted to any existing sash window, an arrangement at once simple and secure. The Asylum weightless frame with balanced sashes is a most desirable form of window for large offices and institutions, and secures the best kind of ventilation. Several iron lights, centre and bottom hung, are also shown.

J. Starkie Gardner and Co., Albert Embankment, Lambeth, have a handsome pair of entrance-gates in wrought iron, in which the plain forged finish is seen. It is a very fine specimen of modern design and workmanship. Pilasters of open scroll-work and hammered leafage, surmounted by a handsome frieze enriched by shields, figured escutcheons, &c., form the main framework. The design is elaborate, and illustrates much of the later periods of wrought-iron design, especially in the intersecting work of the bars, and other details. The same firm exhibit some other work—balcony and panels, and screens, and other examples, all worth study. Messrs. Edgar Keeling, Teale, and Co., Ltd., Ravenscourt-square, show some interesting examples of wrought iron, and works in silver, brass, copper, &c., some screens and candlesticks of copper, and iron stands for lamps.

J. E. C. Carr (Stand 14), Manchester, shows a few highly artistic examples of beaten or repoussé work, finger-plates, locks, and handles, some hand-wrought copper, and modelled metal mosaic work. The repoussé copper and brass panels on wood are very decorative, and broad in treatment.

In the South Gallery, several stands of noted firms are to be seen. The Coalbrookdale Iron Co., Victoria Embankment, have a large and pleasing assortment of their well-known artistic fireplaces in cast iron, bronze, metal, and brass. It is needless to say there is a quietness and

breadth in many of these designs which must appeal to the profession. The cast-iron mantelpieces, painted in simple colours or greys, the grates, railings, the gates, balustrades, and other architectural ironwork which this company turn out are examples of English Renaissance design, and the castings are remarkably clear and sharp. The cabinets and over-mantels and the simpler fireplaces with Wedgwood medallions are unique, and the railings and newel in cast iron are worth inspection.

Messrs. Perry and Co., of Grafton-street, Bond-street, have made a special feature of their electric-light fittings, which are of a very ornamental kind, in the styles of the Renaissance, Louis XV., and other periods. Chased and gilt ormolu lustres for the lights of the future, wrought and mercury gilt electric lustres, ceiling pendants, brackets for walls, candelabra floor and table lamps, grille lanterns, and every appliance and requisite for the fitting up of the electric light that the art of the metal craftsman can furnish may be found in this stand (No. 4). We particularly notice a pair of bronze standards and several three-light Louis XIV. electric candle brackets.

Messrs. Strode and Co., 48, Osnaburgh-street, Regent's Park, whose work is always good, have a very comprehensive stand, comprising "leading specialities" of their manufacture. We can only here mention a few of the most noticeable exhibits they have on view. Their wrought-iron work is of excellent design and workmanship: we notice a wrought-iron dog-grate for wood fire, very well treated: a very beautiful wrought fire-screen with leafage and flowers on the ornamentation: a wrought-iron lantern and bracket, of pleasing shape; newel lights, standards, and table lamps stamped and chased. An electric-light standard of beaten brass and polished iron is another object. The finger plates of brass and electro or white metal, and the lock handles in repoussé copper and white metal are artistic in feeling, and decorative, and we advise all interested in electric-light fittings, electroliers, brackets, and other art iron and brass work to pay a visit to Messrs. Strode and Co.'s stand.

Mr. George Wragge, of Wardry Art-metal Works, Salford, Manchester, has, in stand No. 20, a very choice collection of just those little fittings and finishes in metal which go to brighten and finish a building. The metal work is of an exceedingly artistic character. We notice a number of very simply-treated embossed finger-plates and handles in white metal and brass or copper, also some very pleasing hinges enriched at the ends by embossing or chased work. A wrought-iron hammered grille with bold foliage is exceedingly clever in design. The hammered leafage and stems of the upper part are very effective.

Messrs. Hayward Brothers and Eckstein, Ltd., Union-street, Borough, S.E., have a world-wide reputation for ironwork and fittings of a structural character, and their stand contains many things of interest to architects and builders generally. Here, in stand No. 25, which no one should miss, we see every pattern of Hayward's patent non-slipping pavement light, fitted with the semi-prism lenses, their safety, self-locking coal-plates, &c. The improved straight and spiral staircases we lately described, made by this firm, are seen in two or three examples, and excellent in sharpness and finish they are. Hayward's patent "Jhilmil" metal lathing forms a background to the exhibits of this stand, and its several different applications for walls, partitions, domical ceilings, and moulded work can be seen. Here also we have specimens of Cottam's well-known stable fittings and ventilators.

The choice and artistic stand of high-class work exhibited by Messrs. Barkentin and Krall, of Regent-street, is worth inspection. The altar and processional crosses, jewelled and richly chased, the candlesticks (two of solid crystal) and sanctuary lamps, and other ecclesiastical work are of high-class design and workmanship, and there is also some finely-wrought domestic work.

Other stands, such as those of Longden and Co., who show some very well-designed fireplaces of repoussé metal plaques, and hammered wrought-iron panels with repoussé or copper flowers, and flowers, sconces, and brackets, are worth attention but we must notice other exhibits next week.

The Loan Collection on the upper floor is a valuable and most interesting feature of the exhibition. The want of a catalogue, which has not yet been printed, has prevented us from describing in detail this collection. The exhibits comprise loans from the Queen, the Dukes of Norfolk and Westminster, South Kensington Museum, Elkington and Co., and many other private collections. The cases lent by her Majesty of inlaid firearms, stocks and barrels, and the splendid bronze repoussé plaques found at Kew are alone replete with interest to all lovers of artistic metal-work. These latter specimens are in a capital state of preservation, sharp and defined, the high relief figures representing some incidents of the 18th century, if we are to judge from the style of dress of the figures. The cases lent by the Duke of Norfolk contain many beautiful specimens of metal-work, a jewelled cross, inlaid caskets, and other objects. A case of pistols, barrels and locks, inlaid with gold and silver, signed Nicolin, French 18th century, and some Spanish firearms, inlaid, of the 17th century are of much interest. The carbines and pistols, inlaid with ivory and engraved, of "wheel" and match-locks and flint-locks, are unique, and a few specimens of Damascene work are to be seen. But the principal attraction in the collection is several very fine suits of steel-plated and ornamented armour, as in the cases lent by the Queen, Mr. Seymour Lucas, A.R.A., and the Dukes of Norfolk and Westminster. Here we see helmets, breastplates, gorgets, shoulder, thigh, and leg-guards, gauntlets, some of them fluted, others engraved and gilt.

Mr. David Currie lends a case of breastplates, purse-mounts, and cabinets. The purse-mounts are chased and embossed or incrusted with gold. The cabinets have steel plaques of repoussé work with medallion heads, figures, birds, &c., on a gold ground, and are French of the 16th century. In the annexe is a fine collection of old hammered work, and of cast fire-dogs and fire-plates. On the whole, the student of old metal-work and armoury will find much in this collection of a special character, many of the subjects never having been exhibited before.

FOUNDATIONS AS APPLIED TO LONDON BUILDINGS AND RIVER-SIDE FOUNDATIONS.*

(*Continued from page* 741.)

THE HENNEBIQUE SYSTEM OF CONCRETE CONSTRUCTION.

IN this system, in addition to the use of iron bars or rods to resist tensile stress, a stirrup is inserted at intervals, with the object of holding up the tension members. These stirrups are placed nearer together at the ends of a beam than in the centre, and the system is designed, not only for floors, but for spreading the weight of a superstructure over an extended foundation of soft ground. The calculated strength is the resistance of the iron added to the resistance of the concrete. In the execution of a contract for demolishing an old building in Maiden-lane, London, and building a new one, three stories below ground and ten (subsequently reduced to seven) above, where the site adjoined a court 3ft. wide, upon the opposite side of which was a four-story warehouse, the contract arrangements did not permit of the removal of the soil of the court, and the underpinning of the wall to the warehouse; so the ground had to be kept up with the superincumbent weights all round. The contractors timbered with 2in. polings, aided by 9in. and 12in. timbers, both for struts and walings. This, however, proved quite inadequate at a depth of 30ft. to 42ft., the latter being the depth of the bottom of the trenches. The weight caused the 12in. logs to bend as much as 2in. in the distance of 5ft., at which the cross-struts were spaced. As a consequence the houses all round, and particularly the warehouse across the court, began to indicate signs of settlement. The thickness of the retaining wall was increased, and inverts introduced, and struts placed. Difficulties as to the projection of the area into the street prevented the contractors carrying the excavation to the full extent shown upon the plan when the excavation was commenced; consequently, at a later period, when the building appeared above ground, the front planking and timbers had to be taken out, about one-sixth more earth excavated along the frontage, and the ground retimbered. When this process had reached about 30ft. out of the 42ft. an accident occurred. This timbering gave way at midnight, and let into the basement of the building the whole of the earth above, due (as the contractor believes) to some soakage going on in the blue clay and causing it to spew out at the base. The gas and water mains in the narrow street became broken and the sewer injured. The site appeared to be smothered in liquid mud 30ft. deep in the trench. Probably if sheet planks not less than 3in. thick had been driven close together, joint to joint, anxiety might have been relieved by the use of additional struts. The employment of 2in. poling boards—which the author understands to mean 2in. boards thick inserted behind the walings at slight distances apart—is only effective where the ground is self-supporting, or nearly so. In ground of a loose kind, close sheeting in all such excavations is absolutely necessary.

DEPTH OF THE LONDON CLAY.

In the construction of the Central London Railway the clay has been reached at a depth of 29ft. 6in. below the surface at the Bank Station adjoining the Royal Exchange, at 20ft. at Chancery-lane, and 21ft. 3in. at Davies-street, Oxford-street; the excavation in the shafts indicating 12ft. of made ground over 18in. of loam and 16ft. of gravel at the Bank Station, 6ft. of made ground over 14ft. of gravel at Chancery-lane, and 12ft. 6in. of made ground over 8ft 10in. of hard mud in Oxford-street. While at some places the ballast has been found almost immediately below the surface, there are other places where the solid stratum of gravel underlies marshy ground to a depth of 15ft. or more. In underpinning an existing structure when building an adjoining structure, the foundations for which are required to be at a greater depth than the existing building, the work should be set out so as to be executed in sections of about 5ft. to 10ft. in length, one length being completed before the adjacent length is commenced, and each succeeding section inserted, so that one or more undisturbed section or space of 5ft. to 10ft. is allowed to exist between the section in course of progress and the last finished section. The wall which is underpinned will thus stand on piers 5ft. to 10ft. long, with undisturbed ground intervening. When the stratum of earth on which the piers are built does not prove strong enough to sustain the load upon the piers—an occurrence which cannot be ascertained until excavations are made—the intervening bays should be excavated and the foundations made continuous; but in this case the process of needling up is indispensable. Care must be taken in fixing the needles to leave room to excavate and to fill in between needles before drawing them; also to employ a proper use of raking and shoring pieces, and filling in of window openings as may be essential to obviate danger to the structure, and take care to build up the section with the quality of brickwork suitable for foundations. In

UNDERPINNING WORK

brickwork is usually preferred to concrete, because it is easier to insure tight packing under the old work. Concrete has, however, been successfully used to underpin buildings when carried up to within about 1ft. or 18in. of the old work, and then allowed to set for at least a couple of days before ramming in the remainder with iron rammers, the concrete so used being in a semi-dry condition, and care being taken not only to board up the face and wedge the boards tight against the face of the plastic concrete, but to hammer the boards well in, so as to insure uniform support to the concrete until it has set. Having underpinned in narrow sections of brickwork upon a concrete foundation, the next step is to grout up and properly make good to existing work, and allow this to set for, say, seven days before the next section is disturbed. Where concrete without brickwork is adopted for underpinning, the time needed for setting is longer, and as underpinning is usually employed in piers, the employment of brickwork is a more speedy operation.

IRON SHEETS AND DRY SAND FILLING.

In the case of some residential chambers being built upon the site of Cleveland House, St. James's-square, consisting of eight floors, including basement, to the design of Messrs. Rolfe and Matthews, it became necessary to underpin the old wall of the adjacent building, 20, St. James's-square, under the care of Mr. T. Garratt as architect. The old building, the wall of which had to be underpinned, consists of five floors,

* By ARTHUR T. WALMISLEY, M.Inst.C.E. A paper read before the London Architectural Association on Friday, May 20, 1898.

including basement, and the strata is dry sand. The whole of the underpinning consisted of picked Fletton bricks in cement, resting upon a good bed, attained at the depth excavated in the sand. No concrete was used under the old wall of this adjacent building. The underpinning was carried down in piers under the existing footings to 12ft. to 13ft. below the basement floors, in places where steel stanchion foundations were introduced in the new building to carry the floor girders. The remainder of the wall was underpinned to an average depth of 5ft. 6in. below the basement floor, which is about 11ft. below the road level, or a total depth of about 16ft. 6in. The foundations to the walls of the new building are concrete, and to insure a straight joint between the old and new building, thin sheets of iron were placed between the brickwork of the old building and the concrete of the new building in the foundation and dry sand filling between the old and new work above this level, so that the new work can settle quite independently. The old wall of 20, St. James's-square, varies from 18in. to 27in. in thickness, the adjoining new wall of the residential chambers being 22½in. at the basement floor. The excavations were made so as to build piers in 4ft. to 6ft. lengths, leaving a similar length between each pier undisturbed until these piers were set, a minimum of four days for this purpose being required. The intervening space was then cleared, and the underpinning completed to form a longitudinal continuous support. Where cross walls appeared, the underpinning was carried about 2ft. 6in. under the cross wall beyond the longitudinal underpinning. In the improvements recently effected at the Lord Warden Hotel, Dover, several interior walls upon the ground floor were removed to form an area facing the main entrance suitable for a lounge. It being decided to carry the stanchions, which had to be inserted to support girders carrying the upper walls, upon the lower existing walls, Messrs. Handyside and Co., the contractors, introduced 10in. by 6in. rolled steel joists 6ft. long, as distributing girders, over which a cast iron bed-plate rests, and between this bed-plate and the foot-plate to the stanchion very flat steel wedges were introduced, tapering from 1½in. to ¼in. in a length of 25in., the object being as follows: The wall being properly needled up, the lower portion is removed, the girder inserted, bearing on the stanchions. Brickwork is then built over the girder, and the wedges to stanchions so adjusted that, by assuming the curve shown below, the girder is given work to do before the remaining brickwork is inserted. By this means further deflection is obviated, and subsequent cracks in the existing upper wall are avoided.

STEEL STANCHIONS AND DISTRIBUTING GIRDERS.

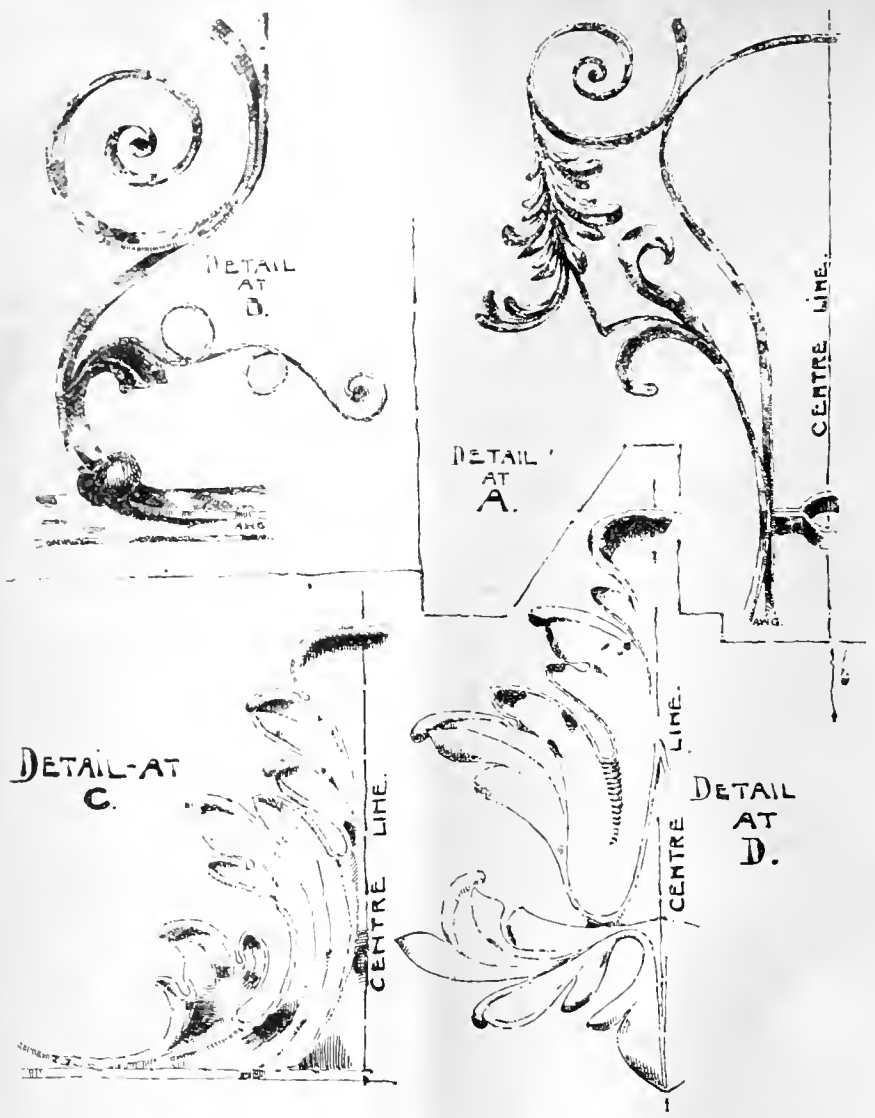
In the building of the new Carlton Hotel, Haymarket, the old walls of the Opera House foundations were left intact, except where the contractors found it necessary to cut through them, for purpose of the new work. The formation was tested to 36ft. 6in. depth below street level, and found to be loamy sand, suitable for foundation. The new front walls are all solid foundations upon continuous concrete. Portland cement concrete (six to one) 3ft. thick was placed under the main walls and under the intermediate walls, everywhere of the same thickness except under the 9in. walls, where 2ft. thickness was adopted, and under stanchions, where a base 9ft. square is used, 4ft. in depth. There is not more than 2ft. difference of level in the top of all the concrete, a difference necessary to suit the floors. The solid columns, 8½in. diameter hammered steel ram), are carried on a cast-iron base plate, 2ft. 8in. by 18in., seating on five rolled steel joists, 18in. by 7in., imbedded in the concrete, each 7ft. long. In some cases four rolled steel joints are used, carrying a solid rolled steel column 7in. diameter. The stanchions are embedded in the brickwork where walls permit, and carry the wall girders. All brickwork is in cement throughout. For large weights, solid blue brick piers in basement support stanchions. The wall next the arcade had to be underpinned by piers 18ft. deep. This wall formerly took the roof of the arcade only, but now supports the side wall of the hotel and seven floors. Six distributing rolled joists, 10in. by 4½in., are inserted to carry the weight of the upper wall on top of crown resting on brickwork. A stanchion was built into each pier, leaving about 2ft. of the face-work next the arcade intact. New arches were inserted, using the old arches as centres. The old arches were then cut out, and the new piers carry the arcade roof and hotel wall at this side. The stanchions, with the surrounding brickwork, carry the springing of the arches. Two 12in. by 3in. channel sections, with two 16in. by ½in. plates form the stanchion, 13in. by 16in. over all. Four rolled joists carry a 16in. square stanchion, 20ft. 2½in. long, with steel ⌐ riveted to the stanchion at the base, and a 11in. column above this, 22ft. 5½in. long, making altogether 42ft. 8in. in height. The stanchions and columns are employed for interior walls only. The 7in. columns, 24ft. 3in. over all vertically, have a base plate 2ft. by 18in., and the construction erected by Messrs. R. Moreland and Son is an interesting example of the use of solid steel stanchions and of distributing girders in foundations arranged with the aid of a cast-iron base-plate to give a pressure not exceeding 1½ tons per square foot. Mr. H. L. Florence is the architect.

CYLINDERS V. SCREW PILES.

At Great Yarmouth, within two years of the building for the town hall being completed, it was found that the western portion, near the river, was settling considerably, and levels were taken monthly, with the result that Mr. Cockrill, the borough surveyor, found these settlements were continuing, especially after heavy rains, or very high or very low tides. The late Sir J. Bazalgette was called in, and he recommended underpinning and building walls under present foundations with concrete blocks. Borings were made showing 6ft. of made ground and 18ft. to 20ft. of soft ooze, below which was gravel. Mr. Cockrill carried on the works under Sir Joseph Bazalgette's instructions. The method of procedure was to sink two cylinders entirely without pumping, a grab being employed to remove the soil inside cylinders, and divers to level and sink them. These were sunk to a depth of 40ft. A trench was opened from the cylinder out to the north-west corner of the building, but immediately on commencing to pump, a settlement was necessarily caused in the building, which so frightened the municipal authorities that they stopped the works, and, of course, as the water rose in the soil, this finished all chance of doing anything further with it. Mr. Cockrill, however, is very strongly of opinion that if he had allowed the matter to have gone on he could have underpinned the corner in forty-eight hours, and when one corner was done it would have been a comparatively easy job to have continued. Sir Benjamin Baker next came on the scene, and with Sir Joseph Bazalgette recommended widening the present foundations by using the concrete blocks made for underpinning. The committee, however, resolved to pull the west part of the building down; but subsequently, upon the advice of Mr. F. E. Duckham, screw piles were introduced. Mr. Duckham's plans consisted of putting rows of cast-iron screw piles at intervals of 9ft. inside and outside the main walls, each about 23ft. long, screwed approximately 3ft. into the gravel bank. On the heads of these piles, longitudinally and parallel with the wall, were placed girders about 15in. deep, and across them, suspended by strong screw bolts, steel joists were placed under the concrete foundations, and then screwed up tight to the concrete, the whole being surrounded with concrete. No settlement has since occurred. The subsoil consisted of a gravel bank underlying 16ft. to 18ft. of ooze and 5ft or 6ft. of made ground, into which the trenches for the concrete foundations were cut. The removal of the water from these trenches tended to jeopardise the building. The piles employed were 2ft. 6in. and 3ft. diameter filled with concrete, so that in the event of the cast iron becoming injuriously affected by the soil of the district the internal concrete columns would sustain the superimposed mass. In the construction of the Liverpool Overhead Railway, wrought-iron girders placed 22ft. centre to centre, at a normal span of 50ft., and at a height of 16ft. above the roadway, are supported by columns built of two steel channels and two plates grouted at their base into cast-iron shoes, which are anchored to concrete foundations by bolts, the concrete footings being arranged so as to distribute a pressure of one ton to the square foot over the surface of the made ground on which they stand. The

SAFE BEARING POWER OF VARIOUS KINDS OF GROUND

may approximately be stated as follows:—Made ground, when dry, as firm earth, will sustain from 2,500lb. to 3,500lb. per square foot, or, say, from 1 ton to 1½ per square foot; but if the subsoil be of an alluvial character, or quicksand, it will be prudent to allow only ½-ton to ¾-ton per square foot, and the same for soft clay near the surface, whereas with moist clay we can allow from 1 ton to 1½ tons per square foot; compact clay, nearly dry, from 2 tons to 2½ tons per square foot; dry, compact clay, of considerable thickness, from 3 tons to 5 tons per square foot; loose sand, from 1 ton to 1½ ton per square foot; compact sand, from 2 tons to 3 tons per square foot; compact sand, prevented from spreading, from 5 tons to 7½ tons per square foot; ordinary gravel and sand, from 2 tons to 3 tons per square foot; but, if the same be compact, dry, and prevented from spreading, from 4 tons to 6 tons; while ordinary rock would safely carry 9 tons per square foot. In the case of the Tower Bridge, it was thought expedient to limit the pressure on the London clay upon which the piers rest to 4 tons per square foot. When the bridge is loaded to its utmost capacity, it is calculated that the granite bed under the columns of the towers sustains 16 tons per square foot, and the Staffordshire blue brickwork immediately beneath the granite 10 tons per square foot. At the Imperial Institute, designed by Mr. T. E. Collcutt, the pressure produced by the foundations upon the blue clay is estimated to be 2½ tons per square foot. The main walls are continuous, but the wing walls are carried by girders attached, in some cases, to stanchions built into brick piers, as shown in the diagram, so as to obtain easy communication in the basement area for pipes and storage connected with exhibition purposes. The stanchions, where introduced, are 14ft. 5½in. over all, and stand on concrete foundations. The outside walls are carried down 14ft. to 19ft. below street level. Clay, when dry, and retained or excavated to a flat angle, is a safe foundation; but mixtures of sand and clay are bad, the sand admitting water, and the clay retaining it. In such a soil, 2 tons per square foot of foundation is sufficient to assume. Landslips in clay occur when a clay bank is left insufficiently protected, or at too steep a surface. In many parts of the Midlands, where it is the immediate subsoil, structures built thereon are apt to slip, and end walls of houses to crack, owing to the shrinkage of clay due to excessive dryness. A landslip occurred on the South London line of the London, Brighton, and South Coast Railway, upon the south side of the line at Denmark Hill Station, where the railway passes in a cutting, having an average depth of 25ft. along the side of the hill rising to the southward, and consisting of London clay. The slopes of the cutting were laid as flat as the limits of the land acquired would allow, and, in order not to encroach on the public road called Champion Park, a surcharged retaining wall was employed to uphold the slopes. For a period of about twelve years after the railway had been opened for traffic the retaining wall appeared quite sufficient to withstand the pressure of the earth behind, although some slight slips occurred on the surface of the slope; these being dealt with in the ordinary way—by taking out the slips and filling up the place with chalk. Later on, owing to a movement in the wall itself, more vigorous measures were adopted, and heavy concrete buttresses were put in below the foundations of the wall, and brought up to the level of the platform. This remedy answered for a time, but the mischief was still going on, and during the winter of 1881 made itself apparent by a further movement of the wall, a sinking of the roadway in Champion Park, with a corresponding rising of the permanent way, which was lifted 2ft. It was therefore decided to put in another wall at the back of the old one, sufficiently deep and heavy to resist the pressure of the moving clay. This was done by the construction of a wall 12ft. in thickness in Portland cement concrete, the foundations being carried down to a depth of 18ft. below rail level of the solid ground, undisturbed by the slip. In addition to this wall, which was built for a length of 100ft., traverse counterforts, 5ft. in thickness, were put in about 13ft. apart, extending from the back of the wall up the slope to the road above, a distance varying from 20ft. to 50ft. The cause of the slip was probably owing to the accumulation of water in the ground forming the slope behind the wall. The retaining wall at the west end of the station also showed signs of moving, and this was strengthened by building raking buttresses in cement brickwork, with intervening arches against the face of it, with concrete foundations carried down to a



depth of 10ft. below the footings of the old wall. Three concrete counterforts, each 12ft. by 10ft., and 28ft. high, carried down 10ft. below rail, were also introduced at the extreme west end of this retaining wall. About 10,000 cubic yards of concrete were put in. The works enumerated above were commenced in December, 1881, and completed by August, 1883. The works, as carried out, have proved effectual in arresting the movement of the earth, and no further trouble has been experienced at this place. The following table shows the angle at which different materials may safely be allowed to have sloping banks :—

TABLE OF ANGLE WITH HORIZON.

The Farringdon-street bridge of the Holborn Viaduct is remarkable as having a platform constructed of cast-iron arches and floor-plates, the only wrought iron employed being for the connecting-bolts. The old bed of the Fleet River crossed the site where the viaduct is carried across the valley, and the bed of the existing Fleet sewer was about 22ft. or 23ft. below the old level of Farringdon-street at the point where the principal arch of the viaduct spans that street, upon the skew. This bed is clay. The scare created as to the fracture of columns or masonry in the piers was due entirely to bad face joints in the bedding of the granite work. There was evidence of stability in the foundations, as not the slightest movement had taken place. The excavations for the foundations were carried 7ft. and over below the old bed of the river into the solid blue clay and concrete. The foundations of the Great Northern Railway Company's goods station in the Farringdon-road are carried down to a depth of 16ft. below the rail level. The piers are of Staffordshire blue bricks set in cement, and are built upon footings of concrete that rest upon the London clay.

TUNNELS UNDER WAREHOUSES.

The Great Northern Railway Company constructed an additional tunnel under some large warehouses in the Brewery-road, Islington, without the removal of any of the heavy stock contained in the warehouses or compensation for stoppage and loss of trade to the owners. The tunnel was built in 6ft. lengths, and as each length was tunnelled out it was arched in at once and neat cement worked in by hydraulic pressure between the arch and the ground above, each length being completely finished before a fresh one was started. Messrs. Holland and Hannen, of Bloomsbury, London, constructed at the Surrey Commercial Dock some new warehouses in the South Dock on concrete piers varying in depth from 22ft. to 29ft. The borings showed the strata in various positions on the site to be in most cases made ground, blue clay, peat, silty clay, sand, and gravel. There were altogether some 250 pier-holes to be excavated, 4ft. 6in. square, and averaging about 20ft. below the surface of water in the dock immediately adjoining. It is obvious that to have kept each pier-hole separately pumped out during operations would have proved an endless task. A large sump-hole was, therefore, formed in the centre of the site, and by these means the water strata was tapped, and by constant pumping the pier-holes were kept sufficiently dry to work in. Some considerable difficulty was experienced with the pumping machinery at the commencement, as ordinary pumps were useless in consequence of the large amount of sand extracted with the water. Centrifugal pumps were tried, but without success, and eventually a Murray's endless chain-pump was erected, which worked satisfactorily until the pier-holes were completed. The City and Southwark Electric Railway, in its course between the Middlesex side of the river and the Monument terminus, passed up Swan-lane near some heavy warehouses tenanted by Messrs. Harker and Co., 102 and 103, Upper Thames-street, spice merchants; Messrs. Walker and Co., Old Swan-lane, packers; Messrs. Davies and Royle, 3, Old Swan-lane, wholesale stationers; Messrs. Wigan and Co., 2, Swan-lane, importers of isinglass. Near the latter warehouse, immediately adjoining the route of the subway, the tunnel left the clay and entered the water-bearing strata. These warehouses have basement, ground floor, first-floor, second floor, and top-floor space, all occupied, some rooms being used for heavy papers, other for cases containing various kinds of fruit and general heavy goods. When the subway works were commenced, various old cracks were found to have existed in these buildings, which gave rise to the apprehension that some danger might occur in the construction of the new tunnels, or by the subsequent working of the railway, so that certain marks were noted, and pieces of paper were pasted over various old cracks, and in other cracks cement-filling were put in, levels of doors and sills taken, and the buildings plumbed both in and out near the angles. This was in the year 1887, before the construction of the tunnel commenced. At Messrs. Wigan's they had an engine (10H.P.) constantly at work upon the ground floor, which would have run irregularly in the event of settlement. Swan-lane is about 13ft. 6in. wide, and the tunnels are there placed one over the other. Compressed air behind a bulkhead was employed to restrain the advent or inflow of water into the space excavated, and no settlement of the upper surface resulted, the water-bearing strata being never without support.

(To be continued.)

DRAWINGS BY CHARLES KEENE.

IN the BUILDING NEWS for January 21 last we published some very interesting sketches by the celebrated *Punch* artist, the late Charles Keene, and in our notes accompanying these illustrations we said, "The old church . . . is unnamed; possibly some of our readers may identify it. This would be an advantage." We have now been favoured with the desired information by Mr. E. Terrell, of Seaton, Devon, who says that the building is none other than the parish church of St. Gregory, at Seaton. He says: "I have attended the church constantly

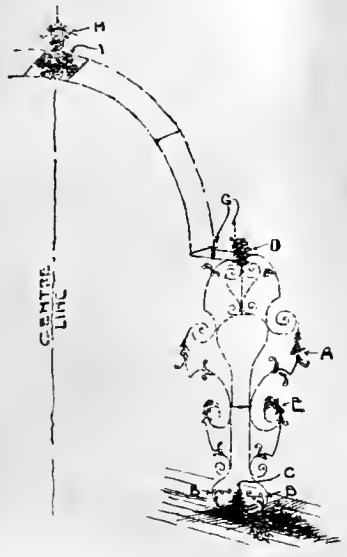
during a residence of seventeen years, so that it is well known to me, and in every detail the drawing corresponds with the building and its surroundings, even to the tombs and the trees in the churchyard, and the pathways." We are glad to be able to give this information, and it adds much to the interest of the matter.

IRONWORK AT SOUTH KENSINGTON MUSEUM.—IV.

By G. A. T. Middleton.

V.—A PAIR OF MACE STANDS.

FLIMSY to excess, yet admirably chosen as an example of much of the ironwork of the latter half of the 17th century—as well as of the next hundred years—is the pair of mace stands from the corporation pew in the parish church of Newcastle-under-Lyme. Constructional supports are lacking, and their place taken by curved members, sufficient doubtless for the actual



necessities of the case, but giving no apparent strength even to that extent. The details are all of rounded outline, the leaves in particular, which may well be compared with those of the Leversedge screen, of somewhat earlier date, illustrated in the last of this series. As new features, attention may be drawn to the tendril B, and the corkscrew terminals at G and H, which latter are none too securely pinned to the bars which support them.

CHIPS.

In the Court of Bankruptcy on Saturday, a receiving order was made against Mr. Walter Graham, architect, of 12, Buckingham-street, Strand.

The new post-office in Bank-street, Annan, N.B., was formally opened on Saturday. It is built of freestone, and occupies a site of 40ft. by 60ft., being two stories in height.

Mr. Humphrey Lewis, timber merchant, of Conway, died on Friday, aged 55 years. For many years he was partner with the late Mr. Peter Lewis in an extensive timber business at Llanrwst, Conway, and Capel Curig. Mr. Humphrey Lewis had taken a prominent part in public affairs at Conway. He was twenty years a town councillor, and served as mayor two years ago. He was a member of the National school governors, and also of the school board.

Colonel W. B. Slake, R.E., held an inquiry on May 25 at the Shire Hall at Nottingham, into the application of the Notts County Council for sanction to borrow £110,000 for the purpose of erecting a lunatic asylum at Radcliffe. Mr. E. P. Hooley, the county surveyor, from whose plans the building will be erected, explained the proposals.

The new Hertfordshire Museum, which is about to be built in Hatfield-road, St Albau's, will be erected from plans by Mr. Arthur S. Flower, F.S.A. A lecture-room and library will form a feature of the institution. The building will be faced with red bricks, red tiles being adopted for roofing, and the heating and ventilation will be on Grundy's system.

OBITUARY.

Mr. Sydney Stent, F.R.I.B.A., M.Inst.C.E., of 43, St. George's-street, Cape Town, died in that capital on May 20, aged 52 years. He joined the Institution of Civil Engineers as an Associate Member in May, 1876, becoming an Ordinary Member seven years later, and he had been a Fellow of the Royal Institute of British Architects since 1880.

We regret to announce the death of Sir Robert Rawlinson, K.C.B., the distinguished engineer and one of the pioneers of sanitary reform in this country, which occurred at the advanced age of four score and eight years, on Tuesday afternoon at his residence, 11, The Boltons, South Kensington. Born in Bristol on February 28, 1810, he was the son of a mason and builder carrying on business at Chorley in Lancashire, and himself began life as a working stonemason in his father's workshops. One of his first engagements was with Jesse Hartley, the famous engineer of the Liverpool Docks, whose office he entered at the age of 21 as a measurer of masonry. Five years later, in 1836, he entered the service of Robert Stephenson, acting as assistant resident engineer on the Blisworth section of the London and North-Western main line. In 1840, the line being completed, he returned to Liverpool as assistant surveyor to the corporation, and four years later was appointed engineer to the Bridgewater Canal. On the passing of the Public Health Act of 1848, the outcome of the late Sir Edwin Chadwick's inquiries into the sanitary condition of our labouring populations, he was one of the first superintending inspectors appointed. In this capacity he visited and inspected numbers of towns all over the country, and the reports in which he exposed the overcrowding, the lack of drains and sewers, the absence of a wholesome water supply, and the general want of cleanliness, which he found in only too many places, were often resented by the municipal authorities. Soon after the outbreak of the Crimean War Mr. Rawlinson, Dr. Sutherland, and Dr. H. Gavin were sent out as members of a Sanitary Commission, and were practically given a free hand by the War Office, being instructed to use the utmost expedition in examining into the causes of, and finding remedies for, the unhealthy state of camp and hospital, but were ordered to see, either personally or through their agents, that works considered necessary were immediately begun, and to superintend their progress day by day until they were finished. The commissioners reached Constantinople in the beginning of March, 1855, and set to work on the Levantine hospitals, and from about 42 per cent. in February the death-rate fell to about 2¼ at the end of June. In the Crimea, which the commissioners reached in April, similar happy results were soon obtained, simply by attention to limewashing, ventilation, scavenging, and uncontaminated water-supply. While on duty, Mr. Rawlinson had a narrow escape from death, being knocked from his horse by a cannon-ball. In 1863 he worked energetically in Lancashire to organise public works for the starving cotton operatives, and reported that, in his opinion, a million and a half sterling might be expended in permanent improvements of a beneficial character, including main sewerage, drainage, forming and completing streets, making new water-reservoirs, and laying out parks and recreation grounds. In consequence of his statements the Treasury advanced out of the Consolidated Fund a sum not exceeding

£1,200,000 at 3½ per cent., on the security of the local rates, to facilitate the execution of the public works suggested. Under Mr. Rawlinson's direction, success attended the experiment; the men were employed at a wage not less than 12s. a week, while the streets and roads in Lancashire that were at this time sewered, drained, paved, and generally improved, if added end to end would have formed a roadway 400 miles long. In this way £1,850,000 in all were spent, and in recognition of the services he rendered, Mr. Rawlinson was made a C.B. On the constitution of the Local Government Board he became chief engineering inspector, and in 1888, upon retiring from the post, which he had held for 16 years, he was promoted to be K.C.B., having already been knighted in 1883. In addition to his official duties, he acted as Chairman of the Royal Commision on the Pollution of Rivers in 1866, and also served on the Commission which inquired into the sanitary condition of Dublin in 1879. He became an Associate Member of the Institution of Civil Engineers in 1848, and served as president in 1894, and was a vice-president of the Society of Arts. He was for a long period a valued contributor to our columns.

Mr. Leopold Lowenstam, the well-known etcher, died, after a long and painful illness, on Saturday, at Woodcroft, Three Bridges, Sussex. Born in 1842 at Amsterdam, he studied there at the Academy until 1870, and acquired such a reputation as an etcher that in 1871, at the request of the Swedish Government, he went to Stockholm, and there founded an etching school. In 1873 Lowenstam came to London. He soon made himself known by his etchings of works by Alma Tadema, Rosa Bonheur, Stacey Marks, Boughton, Sadler, Leader, Kilburn, Linton, Sir Edward Poynter, and others, and exhibited for many years at the Royal Academy. He was awarded the highest distinctions and medals at the London, Paris, Amsterdam, Sydney, Melbourne, Columbian, and other exhibitions.

Dr. Wynn Westcott, Coroner for St. Luke's, held an inquiry, on Friday, respecting the death of George Henry Cope, aged 24, surveyor, lately residing at 78, Cricketfield-road, Clapton. William Courtenay Le Maitre, assistant to the deceased, stated that on Monday afternoon he was with him on the roof of a building at 9A, Hill-street, Finsbury, in the occupation of Messrs. M'Namara, carmen and contractors. The deceased, with a view to alterations, was measuring a chimney stack. In order to do this, he stepped out of the gutter on to the sloping roof, which gave way, and he fell through. Other evidence showed that the deceased fell 15ft. on to the floor of a room, and evidently struck his head on the brickwork of an old disused forge. He died about a quarter of an hour later. Photographs of the roof showed that, although it was apparently sound as viewed from the outside, the rafter had been cut away inside, and the tiles that gave way were supported merely by three battens. At one time a hole had been made in the roof, about 2ft. 6in. square, and this had been merely covered over with tiles instead of being properly repaired. On behalf of Messrs. M'Namara, it was stated that the roof had been in the same condition for the last 20 years, and that they had only had the premises 10 years. Moreover, it was stated that the deceased knew the condition of the roof, as he had been inside the room a few days previously. A verdict of "Accidental Death" was returned.

The new National Schools at Llangedwyn were opened last week. They have been erected from the designs and under the supervision of Mr. W. D. Williams, of the estate office, Llangedwyn, by Mr. R. A. Jones, builder, Llanfyllin. The building is 70ft. by 21ft. 6in., and is designed to accommodate 160 children.

The latest addition to the Bristol tramway system is the extension of the Ashley route, which has now been continued from Sussex-place *viâ* Lower Ashley-road and Warwick-road to Stapleton-road, where it forms a junction with the Old Market and Staple Hill electric line. The construction of this new section has been delayed by the necessity for first carrying out an important widening of Lower Ashley-road, between Pennywell-road and Seymour-road; but since the acquisition of the properties no time has been lost. The new line, which has been constructed under the supervision of Mr. G. R. C. Edwards, resident engineer, was formally inspected on Friday by Sir Francis Marindin, R.E., the Board of Trade inspecting officer.

Building Intelligence.

Birmingham.—Mr. Tart, the manager of the Improvement Scheme, has prepared a set of seven sketch-plans of labourers' dwellings, to be erected upon the Milk-street improvement area. Some time back several tenement dwellings proposed to be erected were opposed by the Health Committee and rejected by the council. A conference has since been held between the Improvement Committee and the Health Committee, formed of four representatives from each body. Mr. Tart's drawings show buildings to be erected in two or three stories, the upper being entered, in some of the designs, from a balcony, and in others by a joint staircase to each pair of houses. The aim of the designer has been to approach as nearly as practicable to letting off two or three rooms, with scullery and other conveniences, at the rate of eighteenpence per room per week. It will not be possible to realise this ideal if anything like the full value is to be allowed for the land. The suggestion is, however, entertained that the rates might bear a portion of the cost of the land as a matter of sanitary improvement. In all the designs 150sq.ft. is allowed as the minimum floor space for a living room and 100ft. for a bedroom.

Brighton.—The new Bible Christian Church in Stamford-avenue was opened a short time since. The building is Early English in style, of semi-cruciform plan, and consists of nave and two wide transepts, and apsidal end. The external walling is of stock bricks with dressings of red bricks and Sussex stone; the roofs are covered with greenish-tinted slates, and are surmounted at the crossing of the transept roofs with an octagonal ventilating turret with oak shingled roof. The window openings are mostly in narrow lancet lights, and are glazed with simple patterns of cathedral glass. The church is placed over the schoolroom; but the gradients have been so utilised as to bring the whole of the windows of the schoolroom above the ground surface; while the external approaches are so arranged as to give access to the church floor level by a rise of only five steps at the east end, and flights of five steps descend to the level of the schoolroom floor at the west end. Internally the walls of the church are finished in plaster, relieved by beads and sunk mouldings. The pews and much of the other woodwork are of pitch-pine. In the rear are a stewards' vestry and a minister's vestry, which are approached by a private staircase, and have also an entrance from the church to the schoolroom. The chapel is seated for 400, and the schoolroom will seat 300, but there are four class-rooms divided off by patent swivel partitions, which can be thrown back, adding space for another 60. The infants' room holds 50 children, and there is also a young women's classroom, accommodating about 30, and kitchen and boiler, sink, and china closet. The heating is by hot-water pipes to the schoolroom and classroom, and by radiators to the church; while the ventilation of the church is provided for by means of exhaust ventilators in the roof, the inlets being arranged by a system of double glazing to portions of the windows, leaving cavities when open in the form of long narrow Tobin tubes. Exhaust shafts are carried up the walls from the schoolroom below. The buildings are lighted with electric light throughout. Mr. E. J. Hamilton, M.S.A., Brighton, was the architect, and Messrs. Saunders and Sons, of Shoreham, were the contractors.

Craigmillar Park, Edinburgh.—The Moderator of the Free Assembly, the Rev. Dr. White, laid last week the memorial-stone of the new Craigmillar Park Free Church, at the end of East Suffolk-road, Edinburgh. The plans have been prepared by Messrs. Sydney Mitchell and Wilson, architects, 13, Young-street, Edinburgh. The church is cruciform, and consists of a nave, aisles, transepts, and a semi-octagonal apse. The tower is in the north-west corner, and in it the main entrance is placed. Over the vestibule between the doorway and the church is placed a western gallery. The nave is divided into three bays by circular columns with moulded capitals, and these carry obliquely-pointed arches. The clerestory windows, of which there is one over each bay, are of three lights, filled with cusped tracery. There are no windows in the aisles themselves in order that they may be in shadow, and thus increase the effect of the ample light in the church itself. The aisles are used entirely as passages, and contain no seats. The apse is separated from the church by a lofty stone arch, and is lighted by three tall and narrow windows with traceried heads. A high panelled dado is carried round the apse, and its floor, which is raised three steps, is laid with encaustic tiles. The pulpit, which is of wood, is placed at one side of the arch between the church and the apse, and the Communion-table, reading-desk, and font are placed in the apse itself. On the north side of the apse, and opening into both it and the north transept by means of stone arches, is the organ-chamber. The roof of the apse is treated as a semi-dome, and is lined with wood and decorated with moulded ribs of the same material. The roof of the nave and transepts is open-timbered. Behind the church, vestry, session-house, ladies' room, &c., are provided. The hall is unusual in shape, being a complete octagon, with a row of low, many-mullioned windows on each of its sides. The tower is square in plan, and is designed without buttresses. At the belfry stage the walls are set back, and an octagonal turret with a pyramidal top is formed at each angle; between these is a panelled parapet, and above this parapet the tower changes from square to octagonal, and finishes with a stone spire. The church is seated for over 700, and the hall for nearly 300.

Durham.—The new County Council buildings in Old Elvet are approaching completion. They are being built from designs by Messrs. Harry Barnes and Frederick E. Coates, of Sunderland and Hartlepool, selected in competition. The front elevation is of red terracotta, and the sides and back are of brick, with buff terracotta dressings. The buildings have a frontage of about 170ft. and a depth of 150ft. In the centre is a large tower with dome, which is the chief feature of the elevation. It is carried on plaster columns, and covered with copper. The building is roofed with green slates. A flight of steps some 40ft. in width leads up to the front entrance, which is through an arched doorway, and minor entrances are placed at the sides. The ground floor is occupied by the council chamber, the committee rooms, offices of the clerk to the County Council, and the reception rooms. The chamber is approached through an anteroom of hexagonal form, 32ft. wide by 33ft. high. The council chamber, which is horseshoe in shape in its lower half, makes the transition to the circular at a height of about 12ft. The diameter is 45ft., and the height 36ft. It is crossed by four arches of 28ft. span, carrying the dome. The walls of the chamber are pierced by several windows of stained glass, and polished marble columns surround the chamber. The committee room is 42ft. by 21ft. From the ground floor access to the floor above is gained by a flight of stairs. The steps originally intended to be of tinted green slates are being constructed of marble. On the floor above are to be the offices of the county surveyor, the county accountant, the county medical officer, and the County Education Department. Above these again are a number of spacious rooms for laboratories, libraries, &c. The basement of the building, in addition to offices for the weights and measures department, contains strong rooms, store rooms, &c., and is entered from the street level; along the corridor of the ground floor runs a dado of faïence work. The marble work is being executed by Messrs. Lowes and Sons, Durham, and Messrs. Burmantofts, of Leeds, have been doing the faïence work. Furniture is being supplied by Messrs. Robson and Son, Newcastle. Messrs. Rule, Sunderland, have done the plasterwork, and Messrs. McCulloch, of Glasgow, have furnished the stained glass windows. The heating apparatus is supplied by Messrs. Ashwell and Nesbitt, of Leicester. Messrs. Rankin and Son, Sunderland, are the sole contractors for building. The entire cost will be about £29,000, including the purchase of land and furniture.

Marylebone.—The new central administrative department of the Marylebone Workhouse has been opened by the Bishop of London. The new building, which has just been completed at a cost of £50,000, stands upon the site of the original administrative blocks and chapel, which were pulled down in the latter part of the year 1896. It is designed to concentrate in one block the whole of the administrative offices (except the laundry) of the workhouse, and such parts as are used in common by all the inmates. The new general dining-hall is capable of seating 1,000 inmates at meals. The walls are faced with glazed bricks, relieved by a dark dado and

coloured bands, and the roof is of open timber, and the lofty walls are treated in panels, decorated in stencilled colour. The tables are so constructed that they can be folded so as to form comfortable backs to the seats when the hall is used for entertainments. Adjoining the dining-hall is the general kitchen, which is fitted with steam and gas apparatus for cooking for as many as 2,000 people at one time. The chapel is seated to hold 550 people. The dining-hall is heated with steam coils, and all other rooms are fitted with open fires, while the whole building is lighted throughout by electricity, gas also being provided at certain points. The buildings have been erected from the designs of Mr. A. Saxon Snell, F.R.I.B.A., by Mr. Charles Wall. An additional block will be erected on the Marylebone-road side of the workhouse, at a further cost of £60,000.

NEWCASTLE-ON-TYNE.—The opening services of the reconstructed Erskine Presbyterian Church, in Rye Hill, Newcastle, took place on Friday. The church has been rebuilt on the site originally occupied by the old church, in accordance with plans prepared by Messrs. Badenoch and Bruce, and it will now accommodate 500 worshippers, whereas only 300 could be accommodated in the old church. The building is designed in Late Gothic style, with walls of rubble, faced on the Rye Hill side by snecked stone facings, with chiselled stone dressings. At the entrances two large porches project into the open space in front, giving access to vestibules and staircases leading to galleries which run round three sides of the building. The roof is constructed with hammer-beam trusses in pitch pine, with cleaded ceilings following the line of rafters and collars, and divided into panels with mouldings planted on. The old schoolroom in the basement has not been interfered with, though the front portion under the vestibules has been converted into a ladies' room and tea-room with wide vestibule, and entrance lobby and lavatories. Mr. Robt. Veitch, of Barrack-road, Newcastle, has been the contractor. The heating will be effected by low-pressure hot-water pipes and radiators. The ventilation is by Causland and Mackay's climax roof ventilators, and the building will throughout be lighted with electricity.—The foundation-stone of the Primitive Methodist central church in Northumberland-road, Newcastle-on-Tyne, was laid on Monday. The church, which cost about £12,200, is planned to seat about 800 worshippers—for the most part on the ground floor—with a wide horseshoe-shaped gallery round three sides of the church. Behind the rostrum is the choir gallery and organ chamber. The entrance lobbies, vestibules, and staircases are spacious, and cloakrooms are provided at the entrances. Special additional exit-doors are provided, so that a large congregation can leave the building in the shortest possible time. The school buildings and vestries will be connected with the church at the rear, and will have a frontage to Ridley-place—there will be lecture hall, galleried schoolroom, church parlour, library, minister's vestry, and classroom, together with a caretaker's house. It is intended to light the whole of the buildings by electricity. The church will be built of stone, with Westmoreland green slate roof. The windows will be glazed with cathedral glass in leaded squares. The internal fittings will be of varnished pitch-pine. The architects are Messrs. Davidson and Bendle, and the contractor was Mr. A. Bruce, all of Newcastle.

OLDSWINFOAD.—On Saturday, May 2nd, the church of St. Mary's, Oldswinford, whose foundation dates back to the 13th century, was re-opened, when the Bishop of Worcester consecrated the new chancel, which has been erected from designs of Mr. J. A. Chatwin, of Birmingham, at a cost of upwards of £3,500. The original church was taken down, with the exception of the tower and spire, nearly sixty years ago, and an unsightly, oblong galleried building with a one-span roof, carried on weak-looking principals, replaced it. The chancel now added is about 40ft. long by 22ft. wide, with a chancel aisle on the south side, and has vestries and a capacious organ-chamber on the north. An arch now divides the nave from the chancel, the roof of which is wagon-headed. In the east wall there is a large window. The style is that of the Decorated period. Beneath the vestries has been provided a room, capable of receiving organ-bellows and a gas-engine. The chancel is faced externally with red Bromsgrove stone, and inside the dressings are of Bath stone. The gain in space by the present alterations will altogether give accommodation for about one hundred more worshippers. It is hoped at a future day to form a nave of the same width as the chancel by erecting two arcades of four arches each. The roof of the nave would then be made to correspond somewhat with the chancel, and the north and south aisles would have a span roof. The present stone walls and windows on the north and south sides of the church would remain. Messrs. Collins and Godfrey, of Tewkesbury, were the builders. The cost was £3,800.

PETERBOROUGH CATHEDRAL.—During the past fortnight much progress has been made under the superintendence of Mr. J. T. Irvine, the architects' clerk of works, in the bottoming of the north-eastern corner of the eastern chapel of Peterborough Cathedral which has so long been failing. The subsidence has threatened the destruction of the beautiful structure with its magnificent fan tracery. It was the last work added to the monastery church before the Reformation. It was built by Abbott Richard Ashton, circa 1438. The work was not finished before the death of Kirkton in 1528. During the work of excavation the workmen came across a mass of tooled stone—tracery of windows, and such like, which had evidently belonged to the Lady-chapel, pulled down to save repairing in 1670. Evidently, after the dean and chapter returned, the weakness of this eastern building was most apparent, and as the ruins of the Lady-chapel were plentifully in evidence, they dug a grip around the failing foundations of the eastern chapel, and pitched the stone in, with an erroneous idea that it would strengthen the foundations. There was no attempt at all of laying the fragments in any sort of order, and thus they have now been found 300 years later. A discovery of the Saxon wall of the ancient monastery has been made. This is one of the most important finds—next to the Saxon church and the Saxon cemetery—of the whole restoration, now extending over a period of over fifteen years. The eastern wall of the chapel has been found to be partially built upon it, and it is this Saxon wall which has sunk and carried with it the foundations of the eastern chapel.

SHAW, LANCS.—A new Congregational school adjoining the chapel in Rochdale-road, Shaw, was opened on Saturday last. On the ground floor are five classrooms, infants' room, 21ft. by 17ft., young men's room, 36ft. by 17ft., and young women's room, 26ft. by 15ft. All the first floor is appropriated by the assembly-hall, which is approached by wide staircases; its dimensions are 68ft. by 36ft., and seats 500 people. A platform, with ante-room attached, is provided at one end of the hall. The heating-chamber, kitchen, &c., are in the basement, under the rear of the building. The front is faced with Hipperholme pitch-faced wallstone, with dressings from the same quarries, the sides and back being faced with Accrington bricks and Yorkshire stone dressings. All the joiners' work inside is of pitch-pine. Mr. Whitworth Whittaker, of Oldham, was the general contractor. The sub-contractors were: Masonry, Mr. J. Bryan Shaw; carpenter and joiners' work, Mr. Booth Smith, Oldham; plumbing, &c., Mr. J. Broadbent, Shaw; plastering, Mr. D. Eastwood, Oldham; slating, Mr. J. Pogson, Shaw; heating, Mr. I. Butterworth, Rochdale. The architect was Mr. F. W. Dixon, Oldham.

Lord Courtenay, heir to the earldom of Devon, and for many years a Local Government Board inspector in the West of England, died yesterday in his 63rd year.

On Thursday in last week, Colonel C. H. Luard, R.E., an inspector of the Local Government Board, held an inquiry into the application of the Southborough Urban District Council for sanction to borrow £2,500 for works of street improvement, and £2,000 for the erection of a public hall.

At the town-hall, Evesham, on Friday night, nearly 200 workpeople engaged on the extensive alterations and building at Wood Norton were entertained to a "rearing supper" by the Duke of Orleans. The work has been proceeding for nearly a year, and it is hoped it will be finished in August, after which the Duke and Duchess of Orleans are expected to be frequent residents at their Worcestershire estate. The contractors are Messrs. Collins and Godfrey, of Tewkesbury, and both were present at the supper, Mr. Collins presiding. Others present were Messrs. C. H. Smith (agent to the Duke of Orleans) and G. H. Hunt, the architect.

Engineering Notes.

RAILWAY THROUGH SAVERNAKE FOREST.—Messrs. John Aird and Co. have just completed a railway which runs through the southern portion of the forest at Savernake, in Wiltshire. The line has been constructed at the instance of the Midland and South-Western Junction Company, who seventeen years since opened the Swindon, Marlborough, and Andover Railway connecting the Great Western system at Swindon Junction on the one side with the South-Western system at Andover Junction on the other, thus leaving Marlborough and other places en route, besides establishing a direct north and south route between the manufacturing districts and Southampton and Portsmouth. Hitherto the company has had to contend with difficulty, delay, and expense by running over five and a half miles of the branch from Marlborough to the Savernake Junction of the Great Western Railway, and it is with the view of obviating these obstacles that the new line has been constructed.

CHIPS.

A new organ, built by Mr. J. J. Binns, of Bramley, has just been placed in St. Wilfred's Church, Kirkby Knowle.

The new workhouse infirmary at Leek was formally opened on Wednesday week. It accommodates 60 beds, and has cost £103 per patient. Mr. J. T. Brealey was the architect, and Mr. E. R. Meldrum the clerk of works.

Major-General H. Darley Crozier, R.E., inspector to the Local Government Board, held an inquiry at the union offices, Bury, Lancs, on Thursday in last week, into the application of the Bury Rural District Council for sanction to borrow £1,200 for works of sewerage for the village of Walshaw, in the township of Tottington-lower-end. The scheme was drawn up by Mr. Joseph Olive, surveyor to the rural council.

Mr. Anning Bell, whose work in the field of decorative design, no less than in that of sculpture, has given tone to the art side of University College, Liverpool, is succeeded by Mr. J. Herbert M'Mair in the conduct of the classes in design at that college. Mr. M'Mair has a reputation as a colourist, and has executed a good deal of work in the form of water-colour and pastel drawings and mural decoration, as well as stained-glass and other branches of applied art.

The Court of Common Council have resolved to abandon its scheme for effecting a great public improvement on the site of the great fire in Cripplegate, owing to the County Council having declined to assist in the matter except upon impracticable conditions.

As a memorial of the Queen's Diamond Jubilee, a stained-glass window has been placed in the parish church of Silverdale, Staffs, and it was dedicated by the Archdeacon of Stoke on Wednesday week. The window was designed and erected by Messrs. Heaton, Butler, and Bayne, of London. It is divided into two panels, and the subjects are the Queen of Sheba and Queen Esther. Below these are the dates 1837 and 1897.

The rural district council of the Isle of Thanet have at length decided that Birchington-on-Sea shall be provided with an efficent system of sewerage, and have instructed Messrs. Bailey-Denton, Son, and Lawford, of Westminster, to report in detail thereon.

A convention of the American Institute of Architects will be held at Washington, D.C., from Nov. 1st to 3rd. The headquarters will be at the Arlington, and the following speakers have been secured to address the convention:—Mr. B. E. Fernow, Chief of the Division of Forestry, of the Agricultural Department; Mr. Merrill, on Building Stones; Mr. Adler, of the Smithsonian Institute, on the place to be assigned to the Jewish people in Architectural History; and Professor Sabine, of Harvard, on Acoustics.

The dredging operations which have been going on for some time past for deepening Jersey Harbour, have now been completed. A channel has been made from the outside roads to inside the mouth of the harbour, having an average depth of 11ft. at low water; also a depth of 9ft. at the railway companies' berths. The work has been done by Messrs. Volker and Bos, of Holland. Over 350,000 cubic yards of sand, blue clay, stones, and silt have been removed.

Wetherby guardians and rural district council have appointed Mr. Silcocks, borough engineer and surveyor, of King's Lynn, who will shortly commence private practice in Leeds, to prepare a scheme of sewerage and sewage disposal for Shadwell.

COMPETITIONS.

GLASGOW INTERNATIONAL EXHIBITION, 1901.—In connection with the competitive plans to be submitted by architects for the Glasgow International Exhibition in 1901, it has been decided by the Building Committee to recommend to the Executive Council that the following professional members of the Building Committee, together with the convener and vice-convener, be appointed a sub-committee to examine the plans when received and to report:—Messrs. J. J. Burnet, A.R.S.; W. Leiper, R.S.A.; A. B. M'Donald, C.E.; W. F. Salmon, James Thomson, and Robert Whitson.

LEEDS.—The Corporate Property Committee of the Leeds Corporation had before them at their last meeting the designs submitted under the motto "White Rose" for the redecorating and refurnishing of the Lord Mayor's rooms at the Town-hall, to which the first premium was awarded as the best designs. Messrs. Marsh, Jones, and Cribb, of Leeds, were the successful competitors, and the committee propose to use their designs as the basis for the work, which, it is expected, will cost about £1,500.

TROWBRIDGE.—The assessor's award in the competitive designs for new schools is expected on June 8. The whole of the designs sent in will be on view at the Town Hall, Trowbridge, on Thursday, Friday, and Saturday, June 9, 10, and 11, from 10 a.m. till 8 p.m. each day. The designs to be returned will be sent to their respective authors after the close of the public exhibition.

WOLVERHAMPTON.—At the meeting of the board of guardians on Friday, a discussion took place upon a report presented by the New Workhouse Committee, with regard to the selection of architects to submit plans for approval. It was recommended that the competition be limited to all architects having offices in the Wolverhampton union, and Messrs. Magnall and Littlewoods, of Manchester, Mr. W. Doubleday, of Birmingham, and Messrs. Marshall and Turner, of Nottingham, and that the author or authors of the designs selected by the guardians as most useful have the appointment of architect, at the usual fee of five per cent. upon the outlay, to include all fees and expenses, and that a fee of £200 be paid to the author of the second best design, and £100 to the third author of merit. An amendment that the competition be limited to three local gentlemen and the three outside architects was agreed to; and, on a voto being taken—twelve local architects being nominated—the following obtained the highest number of votes:—Messrs. Beck, Berrington, and Johnson. It was then decided that £100 be given to the architects sending in the second, third, and fourth best designs.

The board of the Jura-Simplon Railway has ratified the contract with Messrs. Brandt, Brandau, and Co., for the construction of the Simplon Tunnel, and has also approved the loan agreement with the Cantonal Banks Syndicate.

Mr. H. P. Boulnois, a Local Government Board inspector, attended at the Urban Council Room, Wellington, Salop, on May 25, to take evidence in respect to an application from the urban council for sanction to borrow £500 for an improvement at the corner of New-street.

A south aisle, seating 100 persons, and sacristy and side chapel have been added to St. Stephen's Church, Devonport. Messrs. Pethick Brothers, of Plymouth, were the contractors, and the outlay has been about £3,000.

On Thursday in last week the Very Rev. Canon Douglass blessed the new church dedicated to St. Peter, which has been erected in Church-lane, adjacent to the Board schools, Beeston, Nottingham. The building is from the designs of Messrs. Hart, of Corby, and has cost £600. The structure, which will accommodate 150 persons, and which stands on 800 square yards of ground, is of red brick, with stone dressings. Ground is secured for future extension, and also for a priest's house, which will be erected at the earliest opportunity.

At the Free Methodist Sunday-school at Grantham the trustees have been obliged to provide additional accommodation, and recently they acquired a disused malting adjoining the chapel. At a cost of about £300 this has been converted into a schoolroom and lecture-hall, which will seat about 250 persons. The front of the hall has been faced with bricks and stones, the style being in harmony with the façade of the chapel. The work was carried out by Messrs. Wartnaby and Sons, the plans being prepared by Mr. J. W. Taylor, who also supervised the alterations.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—W. M.—A. W. and Son.—V. D.—N. B.—W. M.—H. R.—W. B. C. H.—H. C.

Correspondence.

THE ARCHITECTURAL ASSOCIATION.

To the Editor of the BUILDING NEWS.

SIR,—Although a goodly number attended the annual dinner on May 26, it must have been evident that the old faces were wanting. We looked in vain for Messrs. T. Blashill, J. D. Mathews, J. Slater, Cole Adams, J. A. Gotch, L. Stokes, E. W. Mountford, G. H. Birch, S. Flint Clarkson, and many others.

Of the old lot we found only Messrs. H. Tanner, J. Osborne Smith, and H. Lovegrove, with some more modern friends of the A.A., such as Messrs. Carõe, B. Pite, W. Pite, B. F. Fletcher, and Seth-Smith.

Is it that the change of method has made the older men feel that things are not what they were, and that the old A.A. is fast passing away from the old mutual help society into a teaching branch of the R.I.B.A.?

The improved methods of teaching we all approve of; but the loss of the former friendliness would be very deplorable.—I am, &c.,

OBSERVER.

Adjudications in bankruptcy have been made in the cases of Joseph Brown, North-road, Croydon, and of George James Chivers, Myddelton-square, Islington, and Hornsey-road, Holloway, also a builder.

The town council of Truro having applied to the Local Government Board for sanction to borrow £1,250 for works of paving, Mr. W. A. Ducat, Local Government Board inspector, attended at the Town-hall of that city on May 25 to hold an inquiry. The borough surveyor, Mr. W. C. Clemens, gave details of the proposed expenditure.

Intercommunication.

QUESTIONS.

[11961.]—**Parliament Street.**—Would Mr. Hebb, or any of your correspondents aquainted with the history of modern London, give the date of the actual formation of Parliament-street from Whitehall through the Board of Trade's old offices, which were, previous to this improvement, located in the house formerly belonging to the Earl of Rochester? Parliament-street cut right through the side of the Privy Garden and into Rhenish Wine-yard, Stephen's-alley, White Horse-yard, Clinker's-court, and Wool Staple into New Palace-yard. Great George-street absorbed Bell-alley, George Inn-yard, and Blue Boar's Head Inn-yard. I cannot find an exact reference as to the precise date when this improvement was carried out. Can any reader oblige?—MONTROSE.

REPLIES.

[11957.]—**Breweries.**—There is a very good book named "Breweries and Maltings," by Mr. G. Scammel, and I think that some articles appeared in the "B.N." some years since.—H. L.

[11958.]—**Stone Lintels and Architraves.**—I should advise "Young Architect" to have the lintel in one piece, as any joint except a visible joggle joint would not look well, and the joint is ordinary.—H. L.

[11959.]—**Fixing Columns.**—It would be better to bond the three-quarter columns and to dowel the frustum.—H. L.

[11960.]—**External Wall.**—This is not very clearly put, as it appears that B. intends to build a separate external wall, so how can the wall of A. be a party-wall, which is defined as a wall separating two buildings? If B. intends to raise on the party-wall he must give the usual notice; but if he simply intends to build an adjoining wall, he need not give notice unless he intends to make his footings deeper than A.'s wall, when he must arrange to underpin.—HENRY LOVEGROVE.

CHIPS.

Considerable additions are being made to Farnham Union, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

In the case of John Dewhurst, North End-road, West Kensington, W., electrician, sanitary engineer, and plumber, the discharge from bankruptcy has been suspended.

The urban district council of Twickenham have under consideration the desirability of purchasing for preservation as a public park the riverside Peel Estate at Marble-hill, which for eight or nine years past has been in the market. The estate comprises 63 acres of well wooded land and a house.

The new underground telegraph cable from London to Birmingham is on the point of completion.

Before Sheriff Rutherfurd and a jury in Edinburgh Sheriff Court on Friday, an elderly man of respectable appearance, William Darlington, residing at Easter Duddington, was sentenced to nine months' hard labour on four charges of fraud. The accused had formed a fraudulent scheme of obtaining goods on false pretences by means of letters and post-cards, upon which it was represented that he was a surveyor and required the goods for the purposes of his business. The firms defrauded were: The Decorative Art Tile Company, Ltd., Hanley; Francis Carter, a stationer, Derby; Waterproofing Varnish and Wall Decoration Company, Ltd., Barrhead; and Moore and Co., tile and glass painters, at Lancaster.

Colonel Albert C. Smith, R.E., an inspector from the Local Government Board, held a public inquiry at Weybridge, on the 26th ult., into the application of the urban district council for sanction to borrow £2,500 for works of surface-water drainage, and £2,500 for the improvement of footpaths. The plans were prepared by Mr. J. S. Crawshaw, surveyor to the council. The surface drainage system comprises a new outfall constructed of 18in. stoneware pipes.

At the last meeting of the City Court of Common Council, a report was brought up from the Streets Committee as to the artesian well experimentally sunk in the Petticoat-square site of the model lodging-houses erected by the Corporation, with the view of rendering the tenants independent of the New River Company. They recommended that no further action should be taken in regard to utilising the surplus water from the well, owing to the expense and the insufficiency of the surplus supply for street washing, fire extinction, and other purposes. The report was adopted.

The need of additional accommodation at the Falmouth Hotel for sitting-rooms and suite of rooms has compelled the directors to enlarge the hotel towards the west, and the foundation-stone of the new wing which is to be added was on Thursday in last week laid by Sir Joseph Fayrer. The addition will consist of 80 new rooms, including a coffee-room, facing south and west, and seating over 100 persons. A service-room, kitchen, and scullery will also be added.

NUNEATON CONSERVATIVE CLUB.—ROCHDALE COTTAGE HOMES.—HOUSE AT SHACKLEFORD.—FIREPLACE IN BOLSOVER CASTLE.—HOUSE AT THORPE MANDEVILLE.—DETAIL OF DUTCH SEVENTEENTH-CENTURY CABINET.—ALTRINCHAM TOWN HALL.

Our Illustrations.

NUNEATON NEW CONSERVATIVE CLUB.

The new Conservative Club premises at Nuneaton shown on this illustration are being built. The contractor is Mr. T. Smith, of Chilvers Coton, Nuneaton. The club is to occupy the corner site formed by New Bridge-street and Bondgate. Four floors of the building are to be devoted to the use of the members. In the basement a double skittle-alley occupies the side of site next right-of-way, the remainder of this floor being occupied with beer and wine cellars, heating cellar, and coal store. On the ground floor (which is raised 3ft. above the general street level for the better lighting of the basement), are situated the ordinary members' billiard-room (for two tables) coffee, reading, and smoke rooms, bar, lavatories, secretary's office, and entrances, the principal being from the angle and a side entrance from New Bridge-street. A spacious arcaded entrance-hall contains the wide, open staircase leading to the upper floors. On the first floor, of primary importance is the assembly-hall, to accommodate 500, with gallery at one end, entered off landing of upper stairs. The ceiling of hall is proposed to be a third of the way down from ridge, giving as great cubic contents as are consistent with acoustic requirements. The wood trusses, which are of the hammer-beam type, with moulded ribs, show beneath the ceiling, and spring from stone corbels of moulded section. Retiring and ante-rooms, with their attendants' offices, are conveniently situated and easily accessible from hall. A separate staircase, leading from side entrance to hall, enables the latter to be used without any inconvenience to the other users of the club premises. The ante-room, being situated at the angle of the streets, a glazed door opens on to a speech-gallery or balcony contrived over the front entrance. The other apartment which completes the first floor, is a spacious committee-room on the New Bridge-street side, with open loggia the extent of its front, having hammered iron ornamental balconettes. The second floor contains the honorary members' billiard-room, with ante-room and lavatory running the whole length of New Bridge-street front. By the formation of the roof, accommodation has been provided for a caretaker in same; the kitchen with its attendant offices also being here placed, a lift could be conveniently arranged from the kitchen to the ground floor with intermediate services to the principal rooms on the first and second floors. The building will be heated by hot water on the low-pressure system, and lit by electricity. The materials are red brick, with Bath stone dressings, roof covered with Carnarvon slates, all woodwork internally to be of deal stained dark green; the windows filled with iron casements and leaded lights to open as required for ventilation. The entrance-hall floor is to be laid with terrazzo, the corridor tiles, the basement cement, and the remaining floors wood; that over honorary members' billiard-room will be made soundproof by silicate cotton packing, so that no noise can be transmitted from caretaker's apartments. The roofing will be rendered damp-proof by a layer of under-slating. The building is designed as a Free Classic treatment, a feature being made of the angle, which is boldly relieved by the speech balcony over doorway, and, further, by culminating in an octagon at the top, with pointed roof, forming a base for flagpole. The assembly-hall has been taken advantage of to form the feature in the Bondgate elevation, a semicircular glazed tympanum accentuating the three central lights of the window, and the gable formed producing the desired balancing effect. The New Bridge-street elevation has some relief imparted to it by the committee-room loggia, with its stone arches and columns, and the airy, curved wrought-iron work avoids a tendency to overpowering effect. The architect is Mr. Charles William Smith, M.S.A., Grantham, whose plans were selected in the recent competition, and the work is now in hand.

COTTAGE HOMES, MIDDLEWOOD, FOR THE ROCHDALE UNION.

These homes are to be erected in a hilly district, away from, and out of sight of, the workhouse. The present scheme is for a receiving-home at the entrance to accommodate twelve children, with two spare bedrooms, a superintendent's house, offices, and stores; the house also to accommodate six of the older girls, eight semi-detached homes for boys and girls, each providing for twelve children, with an additional spare bedroom each. Instead of building a hospital, two spare houses are shown similar in plan to the receiving-home, but only one of these is let in the present contract; the workshop shown at the back of the view is also deferred for the present. Each home contains living-room, playroom, kitchen, scullery, bathroom, and the necessary pantries and larders: the ground floor and the upper floor are each divided into two bedrooms for children—one spare bedroom and mothers' bedroom. The ground floors will be mainly laid with wood blocks; the buildings are to be built in Yorkshire pitch-faced parpoints, the gables finished in Parian cement, the chimneys in Ruabon bricks, and the roofs covered with Westmoreland green slates. The number of beds provided in the present scheme, including mothers', is 143, and, as the contract has been let to Messrs. Preston and Dryland, of Littleborough, at the sum of £12,600, this works out at less than £90 per bed. The architects are Messrs. P. Butterworth and Duncan, of South-parade, Rochdale, who are also engaged on plans of a new hospital for over 300 beds for the guardians of the same Union.

HOUSE AT SHACKLEFORD, SURREY.

This house is much more extensive than the last, and it is also designed by Mr. Voysey, who says of them both: "They are only intended for 19th-century homes, and have no architectural growth of anatomical interest." Failing further particulars, we are unable to give the usual information; but, after all, it is the somewhat unusual quaintness of their odd picturesqueness which gives these designs by Mr. Voysey their individuality. This is the residence of the Rev. Leighton Crane. The plans add much to the interest of the plate.

BOLSOVER CASTLE FIREPLACES: NATIONAL SILVER MEDAL DRAWINGS.

In the BUILDING NEWS for April 15 last we gave a double-page plate, reproduced from Mr. A. B. Illston's measured details of these interesting Jacobean or Renaissance chimney-pieces, for which Bolsover Castle is so justly famous. To-day we print another example, one of the best of the series. A rather full description of the building, giving an outline of its history, was given on the occasion when we published the first drawing as above-mentioned; consequently there is nothing to add here to-day. A National Silver Medal was awarded to Mr. Illston for this set of drawings. One more remains to be illustrated, and that will appear shortly—so soon as space will permit.

HOUSE AT THORPE MANDEVILLE, NORTHANTS.

The drawing which illustrates this house is in the Royal Academy Exhibition. The plan explains the internal arrangements of the building, and the simplicity of the exterior forms its characteristic. Oak, left its natural surface, and whitewash are the inside colours employed. Outside, rough-cast and green slates are the materials depended on for effect, with red pots for the chimneys. Mr. C. F. A. Voysey is the architect.

DETAIL OF DUTCH SEVENTEENTH-CENTURY CABINET.

This old piece of solidly-constructed Renaissance furniture has been drawn out by Mr. C. Kemp Bonnar, of Edinburgh, whose details are so clear as to need no description. Sketches in perspective of historic pieces of this kind are interesting enough; but the practical cabinet-maker wants the actuality technically displayed—hence the usefulness of such illustrations as this. The small elevations show the cabinet as a whole. Much of its quaintness depends upon the angle-way set columns on either side. The carving of the piece is reduced to a minimum in quantity.

ALTRINCHAM TOWN HALL.

This design was submitted in an open competition. The sum available was £4,000, which was to include a fire-station and caretaker's house. The public offices are situated on the ground-floor, the council chamber, &c., on the first floor. The council chamber is indicated on the exterior by a long range of windows, flanked by angle turrets. The materials to be of pressed brick, with stone dressings, and green slates on the roof. The author of the design is Mr. F. W. Mee, architect.

CHIPS.

The Goldsmiths' Company have made a grant of £600 to the building fund of the North-Eastern Hospital for Children, Hackney-road, Shoreditch, which is about to be completed after remaining unfinished since 1880.

The repairs to the spire and tower of Salisbury Cathedral have been completed from Sir Arthur Blomfield's plans, and £14,000 has been expended, the whole sum having been subscribed except £600. There is to be a thanksgiving sermon in the cathedral on Monday, July 11, when the sermon will be preached by the Archbishop of Canterbury.

The restoration of the 17th-century town house of Lady Stair in the Lawn Market, Edinburgh, has just been completed from plans by Mr. G. S. Aitken, of Queen-street, Edinburgh, for Lord Rosebery. The house was built in 1622 by Sir William Gray, of Pettendrum.

To the collection of pictures in the Museum at Peel Park, Salford, there has just been added "A Spanish Sheep-stealer," by the late W. Bright Morris.

The new suburban station about a mile and a half from Bristol on the Great Western, which is known as St. Anne's Park, was opened last week. It has been built at a cost of £4,000, and the adjoining district is being laid out for small villas.

Princess Christian has consented to open the new girls' school of the Stepney and Bow Foundation, now being erected in the Bow-road, on Thursday next, the 9th inst., at three o'clock.

Cardinal Vaughan has laid the foundation-stone of a Roman Catholic church, to be dedicated to SS. Peter and Paul, in High-street, Ilford. The church is designed with nave and side aisles, two chapels, and sanctuary, to seat 566 people. At the north end there will be a choir gallery and priests' sacristy. The portion now being built includes a sanctuary, nave, and choir gallery, with seating accommodation for 250 people. The presbytery south of the church will accommodate two priests. The nave will be 84ft. long, 31ft. 6in. wide, and 40ft. high. The sanctuary will be approached by three steps, and will be 23ft. 3in. long, 27ft. wide, and 40ft. high. The style is Perpendicular Gothic. The external dressings will be of Portland stone with Kentish rag facings, and stock bricks relieved with red bricks, and a red-tiled roof. The internal dressings will be of Bath stone. The work is being carried out by Messrs. Gregar and Son, of Stratford, the architect being Mr. Curtis, of London Wall, E.C.

Mr. Robert Collier Driver, of Melrose House, Cromwell-road, and of 4, Whitehall, auctioneer and surveyor, a past-master of the Clothworkers' Company, who died on April 13 last, aged 81 years, leaving personal estate of the net value of £211,153, bequeathed to his sons, Charles William Driver, Robert Manning Driver, and James Hutchinson Driver, £5,000 each; to his son-in-law, Henry Jonas, £5,000; and other legacies to his sisters, daughters-in-law, and grandchildren. He also left to his cashier and head clerk £100 each, and to the Surveyors' Institution, of which he was Past President, £500 for a "Driver Prize," upon like conditions with the annual prize given by him in his lifetime. Mr. Driver bequeathed £10,000 upon trust for his son-in-law Henry Jonas and his children, and he left the residue of his property in equal shares to, or in trust for, his three sons.

LEGAL INTELLIGENCE.

THE L.C.C.'s POWERS TO REJECT PLANS.—Before the Metropolitan Tribunal of Appeal composed of Mr. Arthur Cates (president), Mr. A. A. Hudson, and Mr. J. W. Penfold, sitting at the Surveyors' Institution, an important case under the Building Act, and involving the rights of the London County Council to refuse to sanction plans for the erection of buildings under certain conditions, came on for decision on May 25. The case was one in which Mr. Charles Gillett, a builder, of 190, Eltherne-road, Upper Holloway, was the appellant, and the London County Council were the respondents. Mr. A. F. Wootten was council for the appellant, and Mr. F. Seager Berry appeared for the respondent council. Mr. Wootten, in stating his case, said the point in dispute was an important one as far as building construction in London was concerned, and had been brought forward in order to clear up any difficulties in that connection. Early in the present year Mr. Lawrence, as the architect to the appellant, submitted plans to the London County Council of two houses which it was proposed to erect in Hornsey-road. The houses were intended to be for the use of the working classes, and were to be let in tenements. On April 17th the Council refused to sanction the plans, but gave no definite reason for their refusal. It was held for the appellant that the plans were faultless, and that they were within the provisions of the Building Act. It had been satisfactorily shown that sufficient space was allowed for the admission of light and air. At the rear and front open spaces of 10ft. and 20ft. respectively were allowed, and the entrances gave a width of 12ft. between the houses, together with total lengths of 68ft. in the 12ft. way and 38ft. in the 20ft. way. The total air space allowed to the two houses was 750sq.ft. It was true that the buildings were to be erected on a strip of land between the backs of two rows of houses, but even then plenty of light and air space was provided. The appellant, therefore, claimed a verdict. Mr. Seager Berry, on behalf of the Council, pointed out that, although on the plans the appellant showed what was proposed to be the front of the houses, the Council held, as they were empowered to do, that the entrances for the front were on another side, and that if the plans were sanctioned the builder would be able to extend the length of the houses to a much greater distance than that for which the plans would be sanctioned. It was well established that there could be any number of fronts, and the Council were quite within their rights in saying that a certain part would be the front, notwithstanding what was shown on the plan. Then, again, part 5 of the Building Act laid it down that there should be a double current of air. The Council's point was the allowance of feet in front and behind, because if the houses were started they could be built block after block, and the builder could shelter himself behind the fact that he had so many feet of open space in front and so many at the back. It opened up a vast field for irregular construction in London, and the Council in consequence refused to permit the possibility of it by interpreting what they thought would be the front and back, and not what the architect or builder thought in that respect. It was the intention of the Legislature to prevent that mode of construction. The President: But their intentions are not always realised.—Expert evidence of a medical nature was then called, showing that if the houses were erected as proposed in the original plans they would practically form an insanitary area. The tribunal, after a lengthy deliberation, dismissed the appeal and made no order as to costs. Mr. Wootten applied for a case to be stated for the High Court; but the Tribunal reserved their decision as to whether their finding was based on points of law or matters of fact.

INSUFFICENT AND UNREASONABLE PRIVATE STREETS WORKS. — MANSFIELD CORPORATION V. BUTTERWORTH.—In the Queen's Bench Divison on May 21 Mr. Justice Wills and Mr. Justice Kennedy gave judgment in this special case stated by the justices of the Mansfield Division, before whom objections made under section 7 of the Private Street Works Act, 1892, by the respondent to proposals of the appellants with reference to a street called Quarry-lane were heard. The appellants, resolved, in pursuance of the Act, to execute works of paving, &c., in part of Quarry-lane, in their borough, and specifications of the proposed works, with plans and sections, an estimate of the expenses, and a provisional apportionment, were duly prepared and approved by the appellants. The provisional apportionment included a piece of land belonging to the trustees of Bellamy's Charity, having a frontage of about 200 yards on Quarry-lane, and hereafter referred to as the respoudent's land. The respondent duly objected to the proposals of the appellants on the grounds specified in section 7 (*d*) of the Act—namely, "that the proposed works are insufficient or unreasonable, or that the estimated expenses are excessive." The proposed works were intended to be done over a part of Quarry-lane, about 677 yards in length. Both vehicular and foot traffic has increas ed in the street during the past 12 months, and is increasing, in consequence of the erection (which is still in progress) of a street of houses on land abutting on and adjoining Quarry-lane, but at a further distance from Mansfield than the respondent's land. Vehicular traffic between the new street of houses and Mansfield passes through Quarry-lane. There is no made roadway or footpath, and no foundation to the road, which is uneven, with very deep ruts, but there is a footpath irregularly demarcated with rough stones. There are no sewers to carry off the sewage of the houses erected and in course of erection in the said new street, or of the houses adjoining Quarry-lane, and there is no provision for lighting it. In wet weather Quarry-lane is almost impassable. The average width of Quarry-lane throughout the 677 yards is about 16ft., and for several yards opposite the respondent's land the width is about 12ft. (inclusive of the rough footway referred to, which is 3ft. in width). At other points in the street where the respondent's land does not adjoin Quarry-lane its width is from 14ft. 6in. to 16ft. It was admitted that the estimated expenses stated in the provisional apportionment were not excessive. In support of the respondent's objection it was contended that, inasmuch as it was not part of the plan of the appellants' proposed works that Quarry-lane should be widened opposite any part of the respondent's land, but that the works should be executed whilst retaining Quarry-lane at its present width, the proposed works would be insufficient and unreasonable, and that the insufficiency and unreasonableness meant by the statute had reference to the probable requirements of future vehicular traffic as well as, in addition to, the requirements of present vehicular traffic. For the appellants it was contended that the justices could not find that the proposed works were insufficient and unreasonable within the meaning of section 7 of the Act on the ground only that they considered that the street ought to be widened before any works were done, and that the insufficiency and unreasonableness meant by the statute must be in respect of the nature and character of the proposed works, having regard to the present condition of the street and the traffic over it. The justices were of opinion that the proposed works were insufficient and unreasonable on the ground that the existing width of the highway (that is to say, 9ft. roadway and 3ft. footway) at the point before mentioned was insufficient for a highway, and that such works or any part thereof ought not to be done unless and until the street was made wider, and they therefore adjudged that the works were insufficient and unreasonable on the ground that such proposed works involved the retention of the present width of the street without enlargement. The question for the court was whether the justices could find on the grounds above stated that the proposed works were insufficient and unreasonable within the meaning of section 7 (*d*) of the Act. The court allowed the appeal. Mr. Justice Wills said the Act provided that where a street was not in a state satisfactory to the local authority, they might resolve that certain works should be done, comprehending such works as had been ordered in the present case. The objections that could be made were specified in section 7. Certain of the objections—two of them beyond all doubt—went to the root of the whole scheme, because, if they were valid in fact, they went to establish a state of things in which the local authority had no jurisdiction to pass the resolutions. That was much as it was under section 150 of the Public Health Act, 1875. Under that section the local authority might pass resolutions, execute works, and apportion expenses. But if it turned out that the alleged street was not a street, the whole foundation of the proceedings failed, and the person proceeded against escaped. The Act of 1892 preserved objections of this class, and provided for objections of other kinds. Then the Act gave the justices power, where an objection succeeded, to quash "the resolution." Looking at the whole scheme of the legislation and more particularly at the fact that under section 7 there was a large class of objections relating to the plans and matters of that kind, he thought it impossible to doubt that the jurisdiction of the magistrates was to quash the resolution approving the plans. That was just as effectual in the case of a place which was not a street as if the original resolution were quashed. In the present case the Court was specially concerned with the objection, under clause (*d*) of the section, "that the proposed works are insufficient or unreasonable." At first sight that objection to proposed works might appear to be an objection of the same class as the objection that the place was not a street, going to the root of the whole scheme. But the language of the clause was capable of another construction—namely, as referring to the works as specified in the plans and sections. This was the true construction of the clause, and the Act was not intended to interfere with the jurisdiction of the local authority to adopt the scheme as a whole, but merely to give the justices power to consider the sufficiency and reasonableness of the way in which the work was proposed to be done. The first ground of the objection was the insufficiency of the works. In his opinion, the expression "insufficient" in the clause did not mean insufficient having regard to some matter which might make a better scheme for the neighbourhood in general. The other ground of the objection was the unreasonableness of the works. "Unreasonable" was a much wider word. It did give power to the justices to consider whether or not the thing proposed to be done was as a whole a reasonable thing to be done. That followed from "Sheffield Corporation v. Anderson," where it was held under a local Act similar to the Act of 1892 that the justices had power to say that under the circumstances a sewer was not required for a street. He thought there was no reason to quarrel with that construction of the Act. And if the magistrates had found in this case that the works ought not to be done at all—that is to say, that the works were not required, and had held that the scheme was unreasonable, on that ground they would have had jurisdiction to disapprove of it and quash the resolution approving the plans. But it was plain that the magistrates had not decided anything of that kind. He thought the magistrates had thought it would be a very good thing to have the street made wider, and that they would put the screw on the corporation and get the street widened by withholding their approval of the scheme. It was clear from their deciding that the work was insufficient that they were thinking of the insufficiency of the general scheme for the good of the public; a matter they had no power to consider. And it appeared that they found that the work was unreasonable because they thought that the corporation ought to add to their scheme a widening of the street. The magistrates' order must therefore be quashed, and the appeal allowed. Mr. Justice Kennedy delivered judgment to the like effect.

VALUE OF LAND IN WESTMINSTER.—At the Surveyors' Institution on Friday, an arbitration case, involving a claim for £15,000, the alleged value of land at Westminster, came before Mr. Arthur Cates, president of the Metropolitan Tribunal of Appeal, sitting as sole arbitrator. The parties to the action were the Governors of the Bounty of Queen Anne (the Ecclesiastical Commissioners), claimants; and the united vestry of the parishes of St. Margaret and St. John the Evangelist, Westminster, respondents. Mr. Cripps, Q.C., appearing for the claimants, said it would devolve upon the arbitrator to lay down what was the value of the land in dispute. The Vestry of Westminster under a scheme of improvement proposed to widen Great Smith-street. For that purpose it was necessary to acquire property at present existing in the street, and known as Nos. 1, 3, and 5, Great Smith-street, which belonged to the Governors of Queen Anne's Bounty. The vestry some time ago approved and adopted a scheme of improvement in the street, and had already agreed with the Ecclesiastical Commissioners for the purchase of a portion of No. 8, The Sanctuary, Westminster, which abutted on the northern boundary of the property sought to be acquired. For the purposes of the improvement, however, it was found that it was necessary to secure the houses known as Nos. 1, 3, and 5, Great Smith-street, and notice to treat was accordingly served on the Governors of the Bounty. The case for the claimants was that the value of the land which the vestry desired to compulsorily purchase was much greater than that placed upon it by the vestry. The value stated was held to fairly represent the value of the property. Expert evidence was given by Messrs. Penfold, Currey, and Watney, who, in the main, agreed as to the value of the land. For the vestry Sir William Marriott contended that the charge for the land was altogether too high. Expert evidence was given for the vestry, setting out prices for the land considerably lower than that put upon it for the other side. The arbitrator reserved his award.

A new American brickmaking machine is being tried at some of the Peterboro' brickyards.

The partnership heretofore subsisting between F. B. Wade and H. G. Sargent, architects, Sloane-street, S.W., under the style of Wade and Sargent, has been dissolved.

At the town-hall, Withington, last week, Colonel Hepper, R.E., one of the Local Government Board inspectors, held an inquiry with reference to an application of the urban district council for power to borrow £121 for sewerage works on the Fielden Park estate. The local authority was represented by Mr. A. Roberts, the clerk, and Mr. A. H. Mountain, surveyor.

What is claimed to be the largest pontoon in the world has just been launched from the shipbuilding yard of Messrs. Swan and Hunter (Ltd.), Wallsend. The pontoon, which has been built to the order of the Vulcan Shipping Company, Stettin, to which port it will be towed, is 510ft. long, 110ft. wide, and 42ft. 6in. high, and its lifting power is put down at 11,000 tons. This weight can, however, be increased by tower auxilaries similar to those introduced in the case of the large pontoon recently built by Messrs. Swan and Hunter for the Spanish Government.

PROFESSIONAL AND TRADE SOCIETIES.

ROYAL ARCHÆOLOGICAL INSTITUTE.—A general meeting of the members of the Royal Archæological Institute was held on Wednesday at 20, Hanover-square, W., Judge Baylis, Q.C., presiding. Viscount Dillon having resigned the presidency of the Institute, Sir H. Howorth, M.P., was unamiously elected in his stead. Mr. G. E. Fox, F.S.A., gave a description of some black and white mosaic work on the floor of the calidarium of a house at Pompeii, presumed to have been inhabited by M. Caesius Blandus, a centurion of the 9th Prætorian cohorts. Mr. Fox also described a dwelling-house recently uncovered during the excavations on the site of the old Roman city at Silchester. He explained that this was one of the largest houses which had yet been discovered in the course of the excavations. It was of the courtyard type, and very substantial. The same type was not found amongst the remains of Roman houses at Pompeii. Elaborate arrangements were discovered for heating by means of hot air, and traces were also discernible of the use of braziers for heating purposes. There were corridors on each side of the living-rooms, and fragments of a very fine mosaic pavement had been found in one of the rooms. Supplementing Mr. Fox's information, Mr. F. Davis, who had been present during the uncovering of this house, stated that it had been erected upon the site of an earlier structure. Some 2ft. below one of the floors they had discovered a tesselated pavement which clearly belonged to another and more ancient house. On the south-west corner was found an inclosed chamber paved with very large flagstones. It was the only structure of the kind which had been found at Silchester during the nine years he had been working there.

CHIPS.

The Northern Branch of the Somersetshire Archæological Society had an agreeable meeting at Stanton Drew on Wednesday week, when the vicar, the Rev. H. T. Perfect, acted as guide.

It is stated that the Queen will lay the foundation-stone of the new front of the South Kensington Museum some time in July.

A new town hall is about to be built in Church-street, Oakham, at a cost of about £3,000. The architect is Mr. Edmund Jeeves, of Melton Mowbray.

A new cleansing depot for Glasgow was opened in Graeme-street on Tuesday. The site, 1,864sq.yds. in extent, cost £4,893, or 52s. 6d. per yard, and the outlay on buildings and machinery amounts to nearly £13,500. On the south side of the yard there are a granary and food-mixing machinery, with the ground floor set apart as a cart shed. On the west side are the stables, which occupy three flats, with cart-sheds underneath. Each flat has 20 stalls and four loose boxes, giving accommodation for 72 horses. The north side of the yard is occupied with general stores, offices, muster hall, and saddlers' workshop.

Mr. Edward Mackeson, of 13, Hyde Park-square, who died on March 12, aged 81, desired in his will that his picture of "The Burial of St. Catharine," by Mucke, and the picture of his father's ship should be offered to the Royal Academy; if refused by the Academy, they are to be retained by the executors for their own use, or sold for the benefit of his residuary estate.

The Hôtel Ritz, a new hotel which has been erected in the Place Vendôme, Paris, was opened on Wednesday. There are 150 apartments in the hotel, which stands on the site formerly occupied by the old Lievin mansion, some of the architectural features of which have been preserved in the new building.

An important addition to the fittings of the church of St. Aidan, Leeds, was dedicated last week. A rood was a part of the original design, and from the opening of the church a heavy oaken beam across the entrance to the choir has indicated its position. It has now been finished, at a cost of £300, from designs by Mr. Crawford Hick, the architect of the church work. In the centre stands a figure of the Saviour hanging on the Cross, flanked by figures of the Blessed Virgin and St. John the Evangelist. At the extremities of the supporting beam are kneeling figures of adoring angels, with folded wings.

A stained-glass window has just been placed in German Church, Bradford, by Mr. Dehus. The subject is taken from the well-known print by Hofmann, illustrating the text: "Where two or three are gathered together in my name," &c. The window has been designed and executed by Messrs. Powell Bros., of Park-square, Leeds.

Our Office Table.

IN a letter which appears in Wednesday's *Times*, Mr. G. A. T. Middleton, A.R.I.B.A., draws attention to the responsibilities of architects, as suggested by the verdict of manslaughter against the architect returned by the coroner's jury in the case of the Abbey-mansions disaster. This verdict, he says, raises a point of serious public interest, for it amounts to a declaration of want of skill or knowledge upon the part of the architect, and the question arises as to how large a proportion of architects are fully competent to protect the lives of the public using their buildings. As Mr. Middleton points out, anyone may pose and practise as an architect. There is no compulsory training, no compulsory examination, and the only voluntary examinations, those of the Royal Institute of British Architects, are deplorably weak on the scientific side—weak to the extent of danger. Some few thoughtful men long since recognised this, and promoted a Bill which would place architects, in the matter of training and examination, upon the same footing as doctors and lawyers. Is there, he asks, no member in the House who at this moment, when public attention is drawn to its importance, will take the matter up and not rest until the Bill becomes law?

THE Dean of Canterbury draws attention to the fact that the available burial space in Westminster Abbey is almost exhausted, and asks whether it is not the duty of the nation to improve the surroundings of the Abbey, and above all to connect it with a memorial chapel such as has already been planned and suggested? For many centuries the stream of English history has, Dr. Farrar remarks, flowed through the precincts of our famous Abbey Church; and many instances might be adduced of the deep and stimulating impression which has been created in the minds of illustrious men by the great memories which it enshrines. That Westminster Abbey should henceforth be severed from its immediate connection with the story of our Empire would, he thinks, be nothing short of a national misfortune.

WE are pleased to observe that the north-east staircase leading to the Raphael Gallery at South Kensington Museum, which was recently condemned by the House of Commons Committee as dangerous in case of fire, has been altogether removed, and is now replaced by a stone vestibule connecting the Sheepshanks and the Cartoon Galleries, which will hereafter be hung with pictures. A piece of tapestry has just been hung on the wall at the top of the library stairs at the same museum. It was executed by Mr. William Morris, its subject being the Four Seasons, and is the only one designed by himself, all the other tapestries produced by him having been designed by Sir E. Burne Jones. The new Cross Gallery and its thirteen rooms, devoted to the Oriental collections, are now completely arranged. Entering by the south-east stairs, there is a series of sketches made by Sir William Simpson, R.I., in India, during the Mutiny. The first three rooms contain woodwork, pottery, textiles, and metal-work from Egypt, Syria, and Turkey, including several specimens of large lattice-windows from Cairo, and two sides of different rooms from Damascus. There are also a collection of tiles from Constantinople and Damascus, and two cases of Saracenic glass lamps. The next three rooms contain similar collections from Persia, but are richer in pottery and textiles. A number of full-size coloured copies of beautiful tile-work from Ispahan is shown here. The two succeeding rooms and part of another are devoted to Chinese art-work, principally porcelain. The two farther rooms are devoted entirely to the Japanese collection.

DR. PIGOT, the Dean of Bristol, has issued a fresh appeal for £2,620 to complete the restoration of his Cathedral. He states that up to the present date the following works have been completed by Messrs. Cowlin, of that city, under the direction of the late Mr. J. L. Pearson:—Central tower, Lady-chapel, cloisters, choir-roof, parapets of south choir-aisle, and eastern end of choir; the northern, eastern, and southern bays of the eastern Lady-chapel, the last bay of which is now being completed. The expenditure already sanctioned will allow of completing the eastern bay of the the south choir-aisle. There remain the following works and the approximate estimate for their completion:—To finish Berkeley chapel, £620; north choir-aisle, £900; south choir-aisle, £450; Newton chapel (approximate), £300; roof of Berkeley chapel, £200; south transept, £150; making the total already named of £2,620. As to the south-western side of the cathedral, it is, the Dean states, no exaggeration to say that it is in a ruinous condition, and imperatively requires thorough restoration. It is not a matter of sentiment, but of urgent necessity, for the preservation of the fabric itself.

AN archæological discovery of some interest has been made at Dublin in the course of the operations for electrically equipping the Tramway Company's system. While digging a manhole in connection with the feeder cables close to the walls of Trinity College and opposite the end of Dawson-street, the workmen came on a vault-like structure which on further investigation turned out to be a covering for the famous well of St. Patrick, the exact site of which has been a matter of doubt for some centuries. It appears that the well formerly stood within the grounds of the college; but when Nassau-street was being widened sixty years ago the footpath was built over the wellhouse, which, however, still continued to have an entrance from the Fellows' Garden of the college. With the exception of the late Dr. Stubbs, who always maintained that this was the famous well of St. Patrick, the college authorities do not seem to have interested themselves in the matter, and while antiquarians conjectured, from the fact that Dawson-street was formerly called St. Patrick's Well-lane, that the original well must have been close to the end of Dawson-street, they were unaware of the existence of the well at the edge of the Fellows' Garden which has now been discovered.

THE Sun Insurance Office report for the year ending 31st December, 1897, states that the premiums received, less re-insurances, amount to £1,012,340 8s. 5d., being an increase of £42,655 11s. 5d. as compared with those of the preceding year. The total of the sums insured during the year, after deduction of the amounts re-insured, exceeds £425,000,000, being an increase of about £36,000,000 on the corresponding figures for the year 1896. The losses paid and outstanding amount to £588,296 6s. 7d., being at the rate of 58·11 per cent. on the premiums received. The expenses of management (including commission to agents and working charges of all kinds) amount to £343,252 3s. 10d., being at the rate of 33·91 per cent. The income from investments during the year has amounted to £78,671 16s. 4d. After providing for the usual reserve of 40 per cent. of the premiums to cover liabilities under current policies, a balance of £142,401 9s. 10d. remains, which has been transferred to the credit of the profit and loss account.

The Duke of Cambridge opened on Wednesday a new isolation hospital at Isleworth, for the joint use of the boroughs of Richmond and Hounslow with Isleworth.

The foundation-stone of the church of St. Faith, Crosby, near Liverpool, was laid last week. The church will accommodate 800 persons. It will be of brick faced with Accrington bricks, with red Runcorn stone dressings. The nave will be 109ft. long, and 39ft. wide, with narrow aisles 74ft. in length. The transepts will be 22ft. square, and the chancel 42ft. in length. The fittings and endowment will cost £20,000. Messrs. Grayson and Ould, of Liverpool, are the architects.

With the commencement of warm weather the members of the British School of Archæology in Athens have discontinued their excavations in the island of Milo, and will not resume their work until the return of winter. Up to the present the results of their search have been the discovery of an acropolis beyond the town. Recent investigations have brought to light fresco paintings of great importance as examples of primitive art. They represent men holding fish in their hands, and on the wall are primitive vases.

As many as 99 applications came before the Glasgow Dean of Guild Court on Friday, and although that number has been exceeded, the valuation of the proposed buildings and alterations, £273,000, is the highest on record in the Court. Two of the plans presented to the Court were for the erection of one building 92ft. high and another 119ft. high. The master of works objected to these plans being passed, owing to the great height of the proposed buildings, which, he said, would constitute a serious danger in case of fire, as the pressure of the mains was only sufficient to send water to a height of 73ft. The plans for the 92ft. building were passed, but the Court thought it advisable to delay consideration of the others.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY To-MORROW].—London Architectural Association. Visit to Sutton Place, near Guildford. By rail to Worplesdon per 1.50 p.m. from Waterloo main line.

Edinburgh Architectural Association. Annual excursion to Alloa and Clackmannan. Leave Waverly Station 9.10 a.m.

St. Paul's Ecclesiological Society. Visit to the Church of Northolt. Book to Southall Station via Ealing, by District train, leaving Mansion House at 2.42 p.m.

MONDAY.—Surveyors' Institution. Annual meeting. 3 p.m.

Royal Institute of British Architects. Business meeting. 8 p.m.

Carpenters' Hall, London Wall, E.C. Lecture by James Bartlett, M.S.A., on "The Setting-Out and Construction of Staircases." 7.30 p.m.

The new lavatories for men and women in City-square, Leeds, were opened to the public on the 28th ult. The whole of the fittings have been prepared from special designs, and have been carried out in glazed fireclay and earthenware by Messrs. Doulton, Twyford, and others. The whole of the works have been designed and carried out under the superintendence of Mr. W. Bakewell, F.R.I.B.A., for the corporate property committee, Leeds. Mr. Henry Whiteley has acted as clerk of the works.

Owing to the Epsom race meeting and the approaching Whitsun holidays, business at the London Auction Mart was naturally restricted last week, and the returns fall far below those of the corresponding week in last year, which was not similarly influenced. The total only amounted to £87,881.

The Prince of Wales, who is Vice-Patron of the North London, or University College Hospital, will lay the foundation-stone of the new building now being erected through the generosity of Sir J. Blundell Maple, Bart., M.P., on Tuesday, June 21st. We illustrated the hospital, which will be carried out from plans by Mr. Alfred Waterhouse, R.A., in our issue of May 8, 1896.

Major General F. D. Crozier held a Local Government Board inquiry at Bury, Lancs, on Friday, in reference to an application by the Bury Rural District Council for sanction to borrow £1,200 for the sewering of Walshaw. The Bury Corporation had refused to deal with the sewage, and in consequence of pressure by the Mersey and Irwell Joint Committee the Local Government Board in January issued an order for the district council to do the work.

The foundation-stone of St. Mary's Priory Church, Princethorpe, was laid by the Bishop of Birmingham on the Feast of Our Lady Help of Christians. The church, which was designed by Messrs. Pugin and Pugin, of Westminster, will be completed by October, 1899.

An electric tramway at Kidderminster was opened on Monday. The corporation have resolved to sell to the British Electric Traction Company the power possessed by them under the electric lighting order obtained seven years since, the company undertaking to at once construct works for supplying electric light for town purposes. The corporation lay down conditions as to the repurchase of the power and works, if deemed necessary, at the end of a stated period.

An inquiry has been held at Llanidloes by Mr. H. Percy Boulnois, M.I.C.E., an inspector of the Local Government Board, into the application of the town council for sanction to borrow £12,000 for the purpose of carrying out the scheme of Messrs. F. Beesley and Son for the water supply of the borough, and other improvements.

Mr. E. B. B. Newton, of the Rochdale borough surveyor's department, has been appointed assistant surveyor to the Paddington Vestry, W., at a salary of £300 a year.

A United Free Methodist chapel in Carlton-street, Burton-on-Trent, was opened on Wednesday week. Messrs. Mason and Sons were the builders.

At the meeting of the Middlesex County Council at the Guild Hall, Westminster, on Thursday, the Asylum Committee presented a report, in which they recommended the purchase of an estate of 414 acres at Napsbury, St. Albans, at a cost of £50,000, for the erection of a new county asylum. On the site are eight cottages, a modern farmhouse, and farm buildings, which it is proposed shall remain. The price first asked was £60,000. The sum of £50,000 works out at £113 10s. an acre. The report was adopted without discussion.

The Leeds School Board have agreed to purchase 13,672sq.yds. of land at 10s. a yard in Burton-avenue, off Dewsbury-road, for the purpose of erecting a higher grade school and other premises thereon. Buildings will be erected thereon to accommodate 2,500 children.

Trade News.

WAGES MOVEMENTS.

BOLTON.—A meeting of master joiners was held on Tuesday evening to consider the present dispute. The operatives demanded Easter Monday as a holiday, an increase in overtime rates, an addition to the sum allowed for lodging money, and the introduction of an apprentice rule. The employers gave way on all points except the apprentice rule. They declined to allow any restriction of the number of apprentices. They, however, have agreed that in future apprentices shall be bound. This has been accepted by the men, and a strike has been averted.

BRADFORD.—A deputation from the Leeds Society of Joiners have attended a meeting of Bradford joiners, who are on strike, to consider the action of the Bradford masters in, as it is alleged, inducing Leeds employers to stop men who, since the commencement of the dispute, have left Bradford and obtained work in Leeds. As a result of the conference it is stated the Leeds men will take action if that course of conduct is persisted in by the masters.

LEEDS.—Some months ago the operative plumbers of Leeds intimated to their employers that they required an advance of wages to the extent of 1d. per hour, together with considerable alterations in the working rules. They have been receiving 8d., and they wanted 9d. In the interval the masters have endeavoured to effect a compromise by offering 8½d. per hour, but have so far failed in their object. The men insist on 9d., and for the further consideration of the matter a meeting of the local branch of the Master Plumbers' Association was held on Friday night, Mr. John Skirrow, president, in the chair. There was a numerous attendance, and the question was once more fully discussed. The result was the confirmation of the decision to offer an advance of ½d. per hour. Sheffield, it seems, is the only town in the county in which the plumber is paid 9d. per hour, and that being so, the Leeds employers feel that if they conceded 9d., whilst adjacent towns, such as York, Bradford, Halifax, Huddersfield, and Dewsbury, were continuing to pay less, they would be subject to unfair competition, inasmuch as a considerable proportion of the work now undertaken by Leeds shops is beyond the city boundaries. The representatives of the men, on hearing the masters' decision, plainly indicated that it is the intention of the operatives to come out on strike when their notice terminates—viz., to-day (Friday)—unless their terms are granted. The masters' organisation comprises 60 shops, and all the larger ones; the operatives concerned number between 300 and 400.

NEWPORT.—The dispute between the Newport Master Builders' Association and the carpenters' societies, which resulted in the men being locked out before Easter, shows no signs of being settled. The masters during the last few days have abandoned the lock-out and have thrown their shops open. The men, however, desire a settlement of the overtime question, over which the dispute originated; but up to the present the masters have declined to consider the matter, and have attempted to fill their shops. The attempt has not met with success up to the present. Efforts are being made to bring the parties together again for a fresh conference.

WREXHAM. — The operative carpenters and joiners of Wrexham recently asked an advance in the standard rate of wages, and the request has now been generally granted. The men have received an increase of one halfpenny per hour from 24 of the largest firms. The united committee of the men have issued a circular thanking the employers for their consideration, and assuring them that the men intend to give to the masters an ample return for the increase.

YORK.—No change is reported in the dispute regarding the York carpenters and joiners and their employers. Building matters in the city are practically at a standstill so far as carpentering is concerned. The dispute is resolving itself into a contest of endurance, and who will last the longer has yet to be seen. The York and District Trades Council have resolved to support the men "morally and financially."

A new peal of bells, which have been erected in the tower of All Saints Church, Northallerton, was dedicated on Friday. The old peal of bells were taken down, two new bells being added, and the remaining six retuned.

At the Oxford Encœnia, on the 22nd inst., honorary degrees of D.C.L. will be conferred upon Mr. F. C. Penrose, F.R.S., ex-president R.I.B.A. and late surveyor of St. Paul's, and on Sir J. Scott, K.C.M.G., late Judicial Adviser to the Khedive of Egypt, and Sir E. J. Poynter, P.R.A., Director of the National Gallery.

CHIPS.

Sir J. Wolfe Barry, K.C.B., and Professor Roberts-Austen, C.B., who are members of the committee appointed by the Government to report on the advisability of establishing a national physical laboratory in this country, have left London for the Continent to inspect the Reichanstalt and other technical institutions in Berlin.

A Primitive Methodist chapel in St. Albans-road, Watford, was formally opened on Wednesday week. The building is faced with Fletton red bricks, relieved by Bath stone dressings, the constructive timbers are of Baltic red deal, the whole of the internal joinery being of pitch-pine. The greater part of the congregation is provided for on the ground floor, and a small portion in an end gallery. The accommodation is for 460 persons. The estimated cost, exclusive of land, is £1,650.

Ayscoughgee Hall and Gardens at Spalding, acquired by the town as a place of public resort to celebrate the Queen's Jubilee, were opened on Whit Monday by Mr. H. F. Pollock, M.P. The initiative was taken by the Spalding Urban District Council, and the property has been obtained at a cost of £2,150.

The late Mr. Philip H. Calderon, R.A., who died on April 30, leaves gross estate sworn at £6,168 7s. 1d., the net personalty being £6,013 15s. 8d. The sole executrix of his will is his widow, Mrs. Clara M. Calderon, of Burlington House.

Among the increases of salary granted by the London County Council at the last meeting were the following:—J. Briggs, architect's department, from £325 to £500 by annual instalments of £25; H. Becher, bridges department, from £350 to £400 by two instalments; F. W. Cook, estates clerk, valuer's department, from £350 to £500 by instalments of £25; and W. Garnsey, chief clerk, from £350 to £400 by two instalments; G. Wise, principal assistant, works department, from £300 to £400 by two annual instalments of £50.

The commissioners who recently held an inquiry at Beaumaris touching the proposal for the construction of a light line of railway between Llanfair P.G. and Beaumaris have refused to advise the Board of Trade to grant a provisional order.

The parish church of St. Laurence, Meriden, has just had another point of interest added to its treasures in the shape of a chained book, which was given to the church with an oak chest in 1627. The old Legier Book is a collection of the works of Bishop Jewel, who was Bishop of Salisbury in Elizabeth's reign. The binding has been repaired, and the original chain now attaches it to a desk.

At Marylebone Police-court on Monday, Thomas Lewis, 32, operative painter, was remanded charged with the murder of Walter Gibbs, a house decorator, who died on Saturday morning from injuries alleged to have been inflicted by the prisoner in a fight outside a publichouse in North-street on Friday afternoon.

The Lord Chancellor opened at Farnborough, Hants, on Tuesday, a public hall given to the people, at a cost of several thousand pounds, by Major and Mrs. Holt, in commemoration of her Majesty's Diamond Jubilee.

The Local Government Board have appointed Mr. Jas. Green, of the firm of Weatherall and Green, to be the surveyor under the County Council Improvement Act, 1897, to settle the value of properties within the improvement areas in connection with the Tottenham Court-road and Strand widenings, where it is contended that "betterment" will result.

An outbreak of fire occurred on Monday afternoon at the timber-yard of Messrs. Garland and Roger, situated at the north-east corner of the Edinburgh Dock, Leith. The damage done exceeded £2,000.

The clearance of the Carrington House site begins immediately, and H.M. Office of Works will migrate to Storey's-gate, St. James's Park, shortly, in order to place their present building at the disposal of the wreckers.

A new Congregational chapel and schools are in course of erection in Dacre-street, Morpeth. Mr. T. W. Middlemiss, in commencing excavations for the foundation has come across two large boulders imbedded in the gravel soil, one of limestone weighing between two and three tons, and the other of whinstone weighing not less than twelve tons.

At Hereford a Jubilee footbridge is being thrown across the Wye at the Castle Green. The bridge will rest on two piers in the river, with a central span of 110ft., and will be of concrete and iron. The cost will be £1,200, and Messrs. Findlay and Co., of Glasgow, are the contractors for the ironwork.

The painted copies of the celebrated Raphael cartoons, intended for the Cathedral at Lima, are now nearly finished by Mr. Calderon, and the four last may be seen in the Raphael Gallery at South Kensington Museum.

CHIPS.

A children's wing has been added to the hospital at Lowestoft, from plans by Mr. W. J. Roberts, architect, of that town.

The Bishop of Chichester on Sunday consecrated the church of St. Philip, Aldrington, near Hove.

The members of the Society of Architects will make an excursion to Windsor on Saturday, the 18th inst.

Scarborough Unitarian Church, which has been closed for some weeks, was reopened on Sunday last. The church has been cleaned and painted, a new organ erected, and the electric light installed. In addition to this, some fresco decorations have been painted upon the end wall, each recess or niche containing a figure upon a dull gold background. The figures illustrate the cardinal virtues, Faith, Love, Hope, Peace, &c. The work has been executed by Messrs. Powell Brothers, of Park-square, Leeds, under the supervision of Mr. T. W. Connon, architect, of Leeds.

During a violent thunderstorm at Dartford on Tuesday evening, a flash of lightning struck the tower of the parish church and caused damage estimated at £300. The tower is the oldest part of the church, and was formerly a fortification, built upon some Roman foundations.

Abercorn Park, which the public parks committee have acquired for the Portobello district of Edinburgh, was opened on Saturday afternoon. The grounds have been laid out under the direction of Mr. McLeod, the city gardener.

The Bishop of Chichester opened on Friday the Simmons Church Institute at Seaford. The building seats 150 persons in the large hall, which is 40ft. by 20ft., with a 30ft. apse. The whole is inclosed with a fence. The building cost £1,000, which has been defrayed by Mr. Henry Simmons, who also gave the site. The architect was Mr. H. Curtis Card, of Lewes, and the builder Mr. C. Morliog, of Seaford.

The Leeds City Council agreed on Wednesday to allow another £5,000 to be expended on the experiments in the bacteriological treatment of sewage at Knostrop.

Arrangements are in progress for converting the buildings at present occupied by the Aske's Schools at Hoxton into a technical institute and technical day-school specially suited for equipping pupils for the furniture and cabinet-making trades of the district. The Shoreditch Municipal Technical School will be transferred to these buildings after the summer holidays. The boys in the day technical school will have the advantage of the use of the workshops in the daytime. The day-schools for boys and girls, which are at present located at Hoxton, will be transferred to Hampstead and Acton respectively.

The Independent Methodists at Salem Chapel, Scotland-road, Nelson, have resolved to erect a new school-chapel, which will have accommodation for about 500 adults. The building will cost over £3,000. Two new school-chapels are about to be erected by the Nelson Wesleyan circuit, one in Barkerhouse-road and the other in a neglected part of the town. Accommodation will be provided for 700 persons in each place, and the cost for each is estimated at over £4,500.

A board school, accommodating 500 children, and built at a cost of £1,000, was opened at Allerton-Bywater, near Castleford, on Friday.

The parish church of Craiglockhart, N.B., was reopened on Sunday after restoration from plans by Messrs. Hay and Henderson, architects, of Edinburgh, from whose designs a tower is being added to the building. The style of the new works is Scottish 15th century.

A very satisfactory report has been received by the Unhealthy Dwellings Sub-committee of the Manchester Corporation in regard to the occupation of the Corporation dwellings in Oldham-road and Pollard-street, which were erected under the Artisans and Labourers' Dwellings Act. These two blocks of buildings were completed and ready for occupation in the middle of 1894. At first there was a strong prejudice amongst the labouring class in regard to the occupation of buildings of this description, but this died away during 1896, and the committee are now enabled, in consequence of the large number of applications for tenements, to refuse any applicants whose character may not be satisfactory. On two occasions within the last few weeks the whole of the shops and tenements have been occupied, and the number of empty tenements in either block of buildings will not average more than three per week.

Mr. Walter A. Ducat, Local Government Board Inspector, held an inquiry at Devonport, on Friday, respecting an application of the town council for leave to borrow £9,250 for the purchase of a site for municipal buildings. The site adjoins the South-Western Railway station and the technical school in course of erection.

The new schools, Taunton, are being warmed and ventilated by means of Shorland's pateut Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Baptist church at Pietermaritzburg was crowded yesterday afternoon, says the *Natal Witness* of April 28, on the occasion of the solemnisatiou of the nuptials of Mr. William Hems, third son of Mr. Harry Hems, the well-known ecclesiastical sculptor, of Fair Park, Exeter, Devon, and Florence Isabel, only daughter of Mr. Wm. Loney, of Maritzburg, and formerly of Wellington, Somerset. Among those present was Mr. Harry Hems, who came specially from England to attend the marriage.

The Kent and Surrey Committee of the Commons Preservation Society are to be congratulated on the acquisition of "the highest point in Kent," a piece of land at Toy's Hill, from which the famous view over the Weald of Kent is obtained.

A faculty has been granted by the Consistory Court of Manchester for the restoration of St. Paul's Church, Bury, the work to include the removal of the north and south galleries. The architect is Mr. C. H. Openshaw, of Fleet-street, Manchester.

The great tower at New Brighton, which has been in process of construction for nearly two years, was opened to the public on Whit-Monday. In the lower portion of the structure are a theatre, a ball-room, a winter garden, restaurant, cafés, and shops. The work of erecting the tower and laying-out the grounds has cost over £400,000, and has been executed from designs by Messrs. Maxwell and Tuke, of Manchester and Bury.

A conversazione of the Institution of Civil Engineers was held on Friday night at their house in Great George-street. The programme included an exhibition by Captain Abney of Dr. Joby's photography in natural colours, of views illustrating the total solar eclipse in January last, and of engineering models and scientific apparatus, and electric-lighting methods of the present and of a bygone day.

The memorial stone of a new church for Cunninghame Free Church congregation, Glasgow, was laid, on Saturday afternoon, by Mr. A. Cameron-Corbett, M.P. The new church is situated at the corner of Govan-street and Thistle-street, and is a plain structure, without steeple or tower. Sittings are to be provided in the church for 870 persons; and the halls, with church-officer's house, form three stories, and give accommodation for 900 children. The old church has been acquired by the Glasgow and South-Western Railway Company for £9,000, and the cost of the new buildings is £8,000.

The memorial-stone of a new chapel about to be added to Queen Anne's School, Caversham, near Reading, was laid on Wednesday week. The school was till recently known as Amersham Hall, but has been converted into a country branch school for girls of the Grey Coat Hospital, Westminster. The chapel, which is now in course of erection, is to be of red brick, with stone dressings. It will be 70ft. by 30ft., and has seating accommodation for over 200 persons. The estimated cost is £3,000. The building is in the Late Decorated style. There will be a raised chancel, and the floor will be paved with wood blocks. The roof will be open-timbered, covered in with slates. The work is being carried out by Messrs. Lewis Brothers, builders, Reading, from designs by Sir Arthur Blomfield, A.R.A., and Sons, architects. Mr. Roberts is clerk of the works.

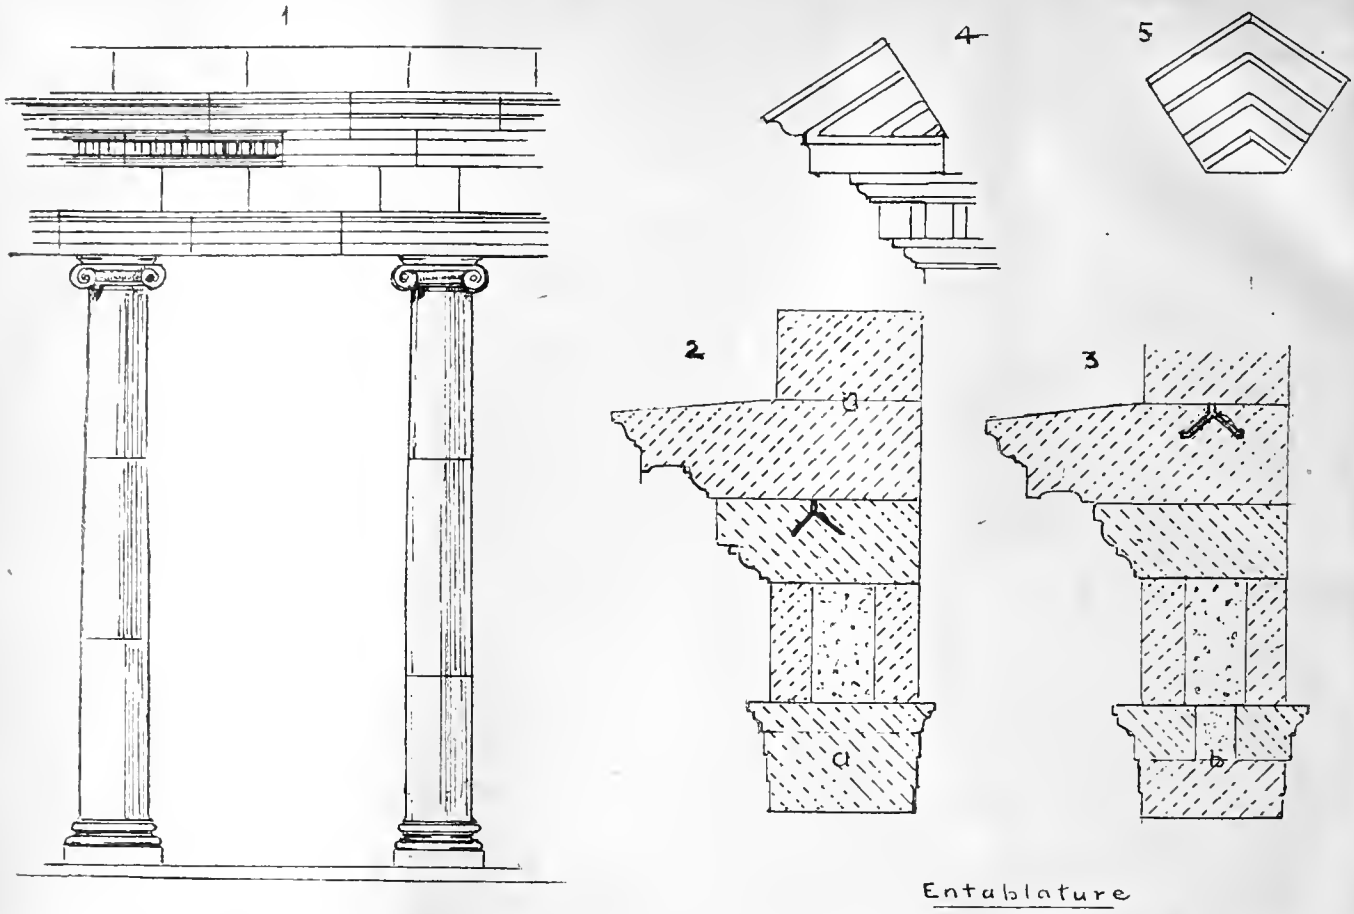
FRIDAY, JUNE 10, 1898.

KEEPING PACE.

THE hurry and rush of professional life at the present day is, perhaps, one of the chief impediments in the way of great achievements. One of the speakers at the Architectural Association Dinner remarked it was a serious matter nowadays to organise and keep going societies; and the same kind of remark applies in a much greater degree to the lack of time and opportunity to keep pace with the advance and growth of industries and the science of the architect's calling. If we consider the immense amount of collateral knowledge now required to equip a man to practise as a competent architect, and the very little time afforded him in a business that must be pushed and kept going, we shall soon realise how hopeless it is for anyone to take to the profession who is not addicted to sustained effort and hard work. A young man who loves his leisure, but who at the same time has a love for art—and there are many such—has little opportunity of making architecture remunerative. The overwhelming number of matters that now call for immediate solution, the mastering of details of trades, many of which are of comparatively new introduction, such as the different systems of hydraulic foundations, the demands of steel, of fireproof construction, of electric lighting, of heating apparatus, and other questions, almost render it impossible for an architect to spend much time over these subjects in the way of thinking over features, of elaborating his thoughts or details. No doubt the inability of one man to master his art in all its baanches, and to thoroughly understand executive details necessary for carrying them into execution, has furnished some ground for dividing the work of the profession—of employing those who are not hampered by the anxieties of practice to prepare the design, leaving to practical men the usual professional duties; but the objection to this division of labour is that designs made apart from the real condition of materials and progressive workmanship are wanting in that true interdependence between labour and art so necessary to success. And the man who works independently of his material falls into platitudes and mannerisms to a greater extent than one who is in touch with the actual requirements of building. We speak now of the hurried way the architect is compelled to carry on his his work; how impossible it is for him to consult any authorities or precedents, to make the necesary arrangements for trades which are absolutely called for, and the consequent unpreparedness with which he enters into any of those numerous details he is called upon to deal with. It is important for him to closely watch the market, to see what new things have come out in the way of ironmongery, of metal-work, decorative and other materials; any inventions in sanitary fittings, heating, electric-lighting, &c. The exhibition and the trade catalogue must both be in evidence; he cannot afford to indulge in cheap sneers at Mr. Smith's taste for iron grates and overmantels or electric fittings when any decided improvement has been made in construction. An exhibition such as that of building appli ances or art metal-work may teach him many things that he could never learn by studying an old treatise or a book on art-metal, and a great deal must be learned from trade catalogues and chats with manufacturing firms. He must have a mind and eye open for picking up sundry things connected with his vocation, and probably the most successful man is he who, in this omnivorous manner, is the picker-up of various unconsidered trifles, and who can appropriate them to his particular work. Take, for example, many things met with in such an exhibition as that of art metal-work open at the Royal Aquarium. An architect who is about to design or specify any iron or metal-work will do well to acquaint himself with the many new forms and sections of cast-iron and bar-iron that are in the market. Suppose he is looking for a water-tight metal casement, he will see dozens of examples of improved casements and frames fixed to jambs and mullioned windows, or if he is in quest of artistic patterns for handles or finger-plates, or electric fittings, he will find many of considerable merit in the collection. One thing we learn from a visit to an exhibition of this kind is the immense strides that have been made in cast work and wrought iron hammered work during the last decade or two;—how many new forms and applications of metal have been made for building, how varied are the wrought steel and iron sections for window frames and sashes; how hammered iron, bronze, aluminium, copper, and other metals can be turned to account for decorative uses, for joinery and furniture, which a few years ago were unknown. Other specialities of construction demand a constant "looking-up." What with tests of brickwork, and iron, and concrete, and the new developments of fire-resisting construction in its many forms of floors and roofs and coverings, the architect must be always taking in and digesting. Such a special branch of construction as stage architecture and machinery, requiring a particular study of theatres and opera-houses, is a matter quite of recent years. The costly and valuable contributions of Mr. Edwin O. Sachs on this branch alone require careful study. The machinery of the stage, and of other forms of complex buildings like big hotels, club-houses, and residences, require a more intimate knowledge of iron and steel construction, hydraulic power, electric motors, and other things, than has hitherto been thought of. Even the comprehensive list of attainments which Vitruvius laid down as necessary for the architect of his day, is quite small if we compare the few abstract principles known in his time which passed for sciences with the numerous special developments of experimental science, any of which would require years to thoroughly master. For it is not so much the abstract and simple principles, but the application of science to building in its varieties, that has to be mastered. The minutiæ of the trades, prices, and legal matters keep a busy practitioner pretty well occupied. The purely artistic must necessarily be left in the rear. Were it not for the artistic gifts which seldom fail their possessor, and his early training and culture in art, it would be quite impossible for an architect in these days to add anything to his store of ideas, and it is because of this, that we think the historical and the artistic parts of his equipment should be learned or cultivated early in the career of the young architect. Happily, there are many agencies for instruction outside the classroom and the elementary studio or workshop. We have named some of them, exhibitions of art and technological products, the lectures and illustrations of professional societies, all of which find a place in the technical press, which can be relied upon by the provincial business man and student. But is not the hurry of the modern architect's work answerable for thoughtless architecture and inferior construction? The best has always been the product of ages when the range of attainments was limited, and there was no haste.

FRENCH PAINTINGS AT THE GUILDHALL.

THE Corporation of the City have this year brought together in their Art Gallery a very interesting loan-collection of French pictures, which illustrate the progress of painting during the last 200 years or more. The earlier pictures are those in Gallery II., where we find one of Antoine Watteau's finest works, "La Gamme d'Amour," vivacious in drawing and rich in colour. It is a small picture of eight figures in a garden; a lady and gentleman in the foreground, the latter playing on a mandolin, while the lady seated on the ground beside him holds the music-book open. Beyond is a group of other figures. This picture is well known from an engraving by Le Bas. Watteau's attractiveness is a certain grace and freshness in depicting the society of the early 18th century, and his subjects are pastoral festivities, music, and dance. "A Garden Scene" (51)—figures in a garden, a gentleman in red playing a guitar to a lady in white who sits at his side, playing with a spaniel, a child at her feet, is also a pleasing little picture. A very charming and brilliant little piece, "The Duet" (53), only 7in. by 6in., lent by Sir Francis Cook, Bart., represents a man and woman singing by candle-light, the light falling on the music-book. Next we have a work by J. B. Greuze, also small, lent by Lord Wantage, "A Girl with a Young Bird," an exquisite work, full of grace, movement, and tenderness. "Marie Antoinette and her Children," by Madame le Brun, a small panel, depicts the beautiful and unfortunate wife of Louis XVI. as she was before the disastrous Revolution to which she fell a victim. Her three children are in the group. Another brilliant Watteau is 71, "A Fête Champêtre," a garden or wood full of figures; one couple is dancing to pipers, and a lady in white satin and pink cloak and two children are looking on, while others are coquetting. Works attributed to De la Haye, "A Lady and Gentleman Playing Cards" (50), is Dutchlike in its quality and finish. Further on we have a large full-length portrait of the Duc de Penthièvre, in a grey costume, with black hat in his hand. An attendant is divesting the Duke of his embroidered cloak. The delicate silver grey and the scarlet livery of the stooping servant, the couch of pale blue and gold, make a very harmonious scheme of colour. It is painted by J. M. Nattier, a great portrait artist, who died in 1766. Lord Wantage's Lancret, "A Garden Party" (84), is a fine work, with much of the Watteau style, but quieter. The group of figures, especially the children; and landscape, are delightful. "The Swing" (78) is another interesting example. Mr. Alfred de Rothschild's works by Boucher, such as "Cupid and Children" (85), "A Group of Children" (74), are good examples. But for the general picture-admirer the canvases of the large gallery are the most attractive. What can be finer than the "Solitude," by H. Harpignies?—a sunset landscape with the reflected light on the winding river between wooded banks. The "Funeral of a Chief in the Iron Age," by Fernand Cormon, exhibited in the Paris Salon of 1892, we have seen before. Amidst a crowd of savages armed with weapons, the burning of the funeral pile is going on; the very clever picture "Execution of Marshal Ney after the Defeat at Waterloo," by J. L. Gérome, is also here. G. Laugée Fils' picture of "The Widow" (4) is feelingly painted. The fine example of Bastien-Lepage, "La Saison Octobre," or the "Potato Harvest," is worth looking at again—women and girls in a field filling sacks with potatoes—a powerful work of the best realism. Meunier's picture, "The Emigrants," an old man and his daughter

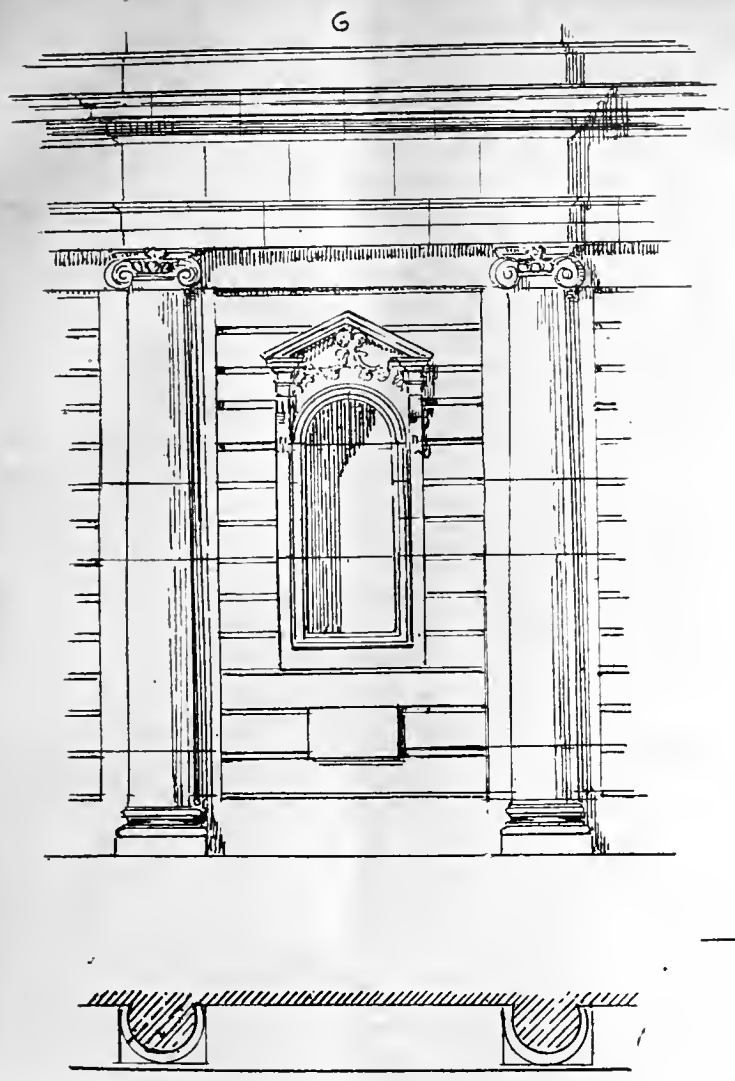


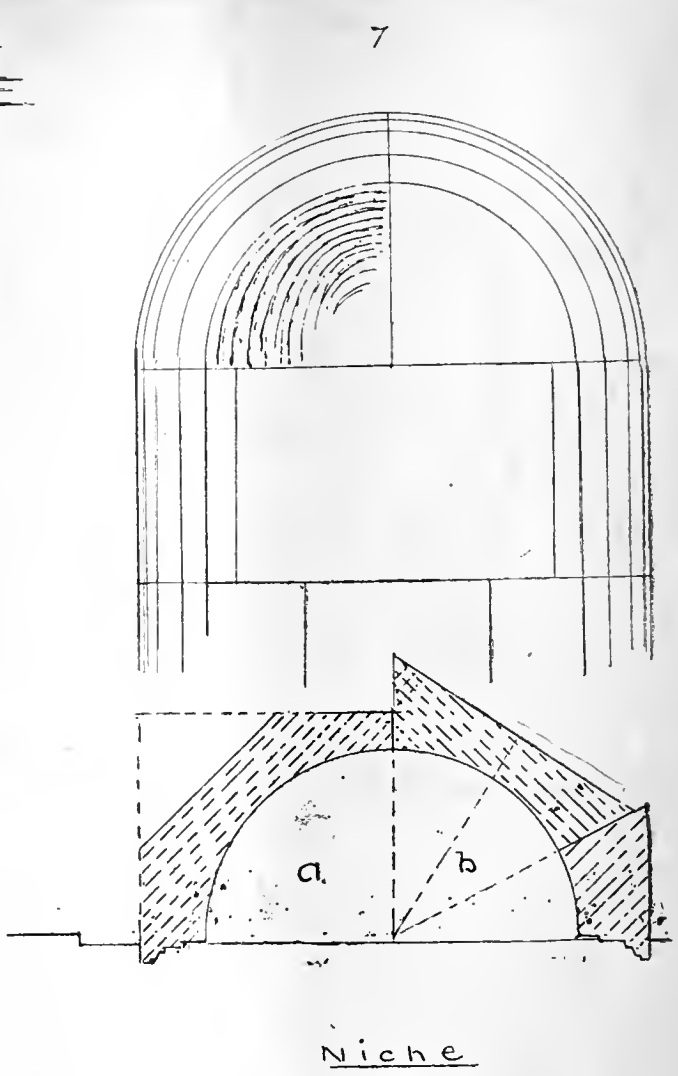
trudging along a sandy road, with their belongings, is full of pathos and tenderness of expression. A very fine work by C. F. Jalabert, "Christ Walking on the Sea" (12), lent by H.R.H. the Duchess of Albany, will attract attention. The scene illustrates the narrative of Mark vi. 48, where our Saviour appears to the affrighted crew in the fourth watch of the night. The luminous and radiant figure of the Saviour is diguified and mystically realised. The very large seascape "A Rescue at Sea from a Burning Vessel," by A. Morlon, lent by the painter, is a very effective piece of sea-painting; the blazing hull of a large vessel is seen in the distance amidst a tempestuous sea, while a boat full of the picked-up crew is trying to save a man, who clings to a floating spar, by throwing a life-belt to him. A very choice piece of flower-painting is E. Bidau's charming group of white and pink roses and playful kittens (14). Jean Béraud is seen at his best in "Réunion à la Salle Grafford," where an audience of enthusiasts shout hoarsely "Vive La Commune!" The galleried hall is crowded with Communists of the most fanatical type; one wild-looking man on a platform by the side of the chairman holds up his large hand, and in wild gesticulation is haranguing his colleagues. The characters are drawn from life, and the scene is full of animation. Jules Breton's "The First Communion," a procession of young girls clad in white carrying tapers, breathes of the poetry of human life. One little girl is being kissed by her mother on her way. A fine example of F. Roybet, "La Sarabande," is a large and prominently-hung picture at the end of gallery. The principal figures—a gentleman playing a mandolin, his young wife seated beside him, in pale-blue silk, while two children—a boy and girl—are stepping to a dance, is graceful and brilliant in colour. On the other wall the colossal picture of "Friedland," by J. E. Meissonier, well known from the etching by Jacquet, published by Arthur Tooth and Sons, hangs, a marvellous example of movement and expression. The scene illustrates the French army, commanded by Napoleon, about to meet the Russian forces, 14th June, 1807. The Emperor, with his generals around him, is looking on at the dashing cavalry regiment, which is sweeping past him through a mass of thick grass. Each horse and rider is made a study, and the eye is struck as much by the breadth and skill of the massing as by the extreme finish and detail. "A Reconnaissance," a painful incident in the siege of Paris, by Edouard Detaille, is another work of infinite care and skill. E. Burnand's "Return of the Prodigal" (27), Dagnan-Bouveret's "Bretonnes au Pardon," a clever group of nuns seated on the grass are interesting works. The sensational but clever picture by Albert Maignan, of the "Death of William the Conqueror," and the touching and beautiful repose of a young girl lying dead, "Une Bienheureuse" ("The Sleep of the Blessed Dead"), are pictures of merit. The fine work by J. L. Gérôme, "The Cardinal in Grey," a grand staircase scene, where the barefooted Capuchin is descending a noble flight in the Old Palais Cardinal, while a servile crowd of courtiers are ascending on one side, bowing low, and after they pass on the upper flight are seen to look round at the cardinal in an insolent manner, is a clever piece of irony. "La Salutation Angelique," by Guillaume Dubufe, is decorative; and we must notice also J. Tissot's "Too Early," a piece of amusing *genre*, and his touching "Last Evening" (45); Fantin-Latour's flowers (43A), "Cupid and Psyche," G. W. A. Bouguereau. In the second gallery is a fine work by Corot, "Le Lac," a beautiful lake scene, the tone and softness of the colour and foliage exceedingly beautiful. In the third gallery, a little work of much value, "Fainting of the Virgin" (141), by Paul Delaroche, is full of devotional feeling; and we must also notice a work by Armand Charnay, very charming and delicate in colour; and some clever figure-subjects, Meissonier (132, 134), portrait of Madame Gautreau, by G. Gustave Courtois, and pictures of Carolus Duran, Gustave Courbet (143), a delightful sandy shore—a harmony of greys; E. Degas, Cazin, Monet, J. Renoir, and other well-known French painters. The latter's "A Cup of Tea" (150) is a daring piece of colour.

MODEL SPECIFICATIONS.—XVI.

MASON.

IN the specification of finished Classical work particular care is necessary. We now give clauses for the execution of columns, entablatures, and pediments. In specifying these features, the bases, shafts, capitals, entablatures, the jointing, dowels, and cramps ought to be described unless the drawings show these details. As to columns, it is not usual in Classic architecture that the ashlar joints are continued through the shafts; they may be, if of considerable height, of three or more stones. For example, in the Strand front of Somerset House, which is before us as we write, the columns (three-quarter) above the ground story are about 18ft. or 20ft. in height of shaft, and have three stones or frustra between base and capital. The lowest stones are the shortest, the two upper ones being about equal height, or 7ft. in length each. The base and capital are, of course, separate stones, and their bed-joints course with the ashlar. The shafts are, as usual, diminished, and the small curves or apophyges joining the upper fillet of base and the lower fillet of the neck of capital are included in the base and capital respectively, not worked on the shafts. When they are so worked, the cylindrical shaft has to be sunk to the full projection of the fillet—an undesirable and uneconomical plan, though it may look a little better if the bed-joint is placed below the upper fillet of the base. Columns of three-quarter projection may be dowelled at the beds, or preferably bonded at intervals. In lofty columns the stones should be bedded upon 4lb. lead, about an inch within the face of shaft. Sometimes thin laminæ of pine are used instead of lead, and these seatings prevent flushing at the joints, and equalise the pressure. For





Niche

bedding, stone-dust mortar is sometimes used. The joints should be few and fine; the stones of the frustra for each shaft should be selected. Vertical joints are wrong, though they are seen occasionally in Continental buildings. The beds or ends of each stone should be worked to exactly true and parallel planes, and the sides of column or each stone be worked to a diminishing rule.

The distance apart of the columns must determine the number of stones or joints of the entablature over. When the columns are engaged, as in the building mentioned, the architrave can be partly supported on its inner side by the stones tailing into the wall; but when the entablature is isolated, as in a portico or colonnade, proper means must be taken to insure support if the intercolumnar spaces are wide. Rondelet and other French writers describe the tying together of the stones by rods and bars. In ordinary cases, where the columns are three or more diameters apart, the distance may be spanned by three stones, the centre one, or "key-stone" being joggled to the other two which rest on the columns. But, of course, the quality of stone used, and whether it can be obtained solid in long lengths, must guide the architect. Bartholomew, in his work on "Practical Specifications," now rather out of date, suggests several constructive expedients, and for stucco and cement entablature they are necessary. More modern plans are to use concrete with steel bars imbedded in the frieze part behind the ashlar; to insert wrought-iron flanged beams between the outer and inner faces of the entablature, or to use concealed flat brick arches with iron ties behind the ashlar if there is any weight. But a solid stone architrave, or architrave and frieze in two courses, breaking joint, with joggled joints, is to be preferred for substantial buildings.

Our sketches give examples of columns—The first, Fig. 1, shows a colonnade, the columns and entablature isolated, with the mode of constructing the latter. Fig. 2 shows a solidly-built entablature with solid stone architrave; but the frieze is ashlared, leaving a cavity filled with brickwork or concrete, *a*. Fig. 3 shows the architrave in two stones, the upper mouldings not being worked out of one stone, *b*; but there seems to be little advantage in this plan. The figures 4 and 5 show the springer and apex stones of a pediment. The bed moulding is worked in a separate stone for large cornices.

In Fig. 6 we show engaged columns taken from an actual building (St. Mary-le-Strand). These three-quarter columns, which are about 1ft. 8in. in diameter, adorn the church on both sides, and form the lower of the two orders used; the upper range of columns is of the Corinthian Order. These columns on the lower story stand on a high plain podium or basement. The intercolumnal spaces are rusticated with plain channels between the row of niches and pilasters, which channelled joints stop against plain vertical faces of projecting stonework, from which the columns project. The beds of each rusticated course occur at the top of each channel joint, and are continued through the plain ashlar backing, though we have not shown them in sketch. The columns are jointed as shown, the base stone level with top of first rustication, then a long stone, then a bonder in the centre equal to the height of two rustics, and then another long stone to the apophyge of neck of capital. The effect is good. In other cases, as at the Mansion House, the pilasters are composed of four long blocks, with three intermediate stones of a course or two high, which are bonders. The thickness of bed of the bonding stones should be specified.

A semicircular niche is often required in Classical work. Fig. 7 shews one used between the side pilasters of St. Mary's Church. The head of niche is worked in two stones by a centre vertical joint, and we may imagine four such stones cut out of a single block. On the other side, *b*, the manner of jointing the back of niche is shown, the stones alternately breaking joint and bonding into the wall. Only two courses are used below head of niche.

30. *Columns.*—The columns of colonnade (or portico) to be worked out of selected Portland (or other) stone, free from vents, unsightly veins, sand-holes, and other defects, according to drawings, with bases and capitals as shown in detail. Each shaft to be diminished according to rule or drawing to a true entasis, and to be in three (or more) stones, the apophyges to be worked on base and capital. The beds of columns to be brought to a perfectly flat and level surface, and to have 4lb. lead seatings (or pitch-pine seatings) ¼in. thick, allowing 1in. free all round from face (or to be bedded in stone-dust mortar). Or—

31. *Pilasters.*—They are to be monoliths, or are to be in not less than two blocks of stone. The caps and bases to be of solid stones jointed below the apophyge in one case, and above it in the other. The pilasters corresponding to the columns to be bonded not less than 9in. (or 12in.) into the wall every other course. Or—

The pilasters to be of three (or more) stones, and bonded every two or three courses into the wall to a distance of at least 9in. Each stone to be wrought with true and level surfaces and beds.

32.—*Entablature of Portico or Colonnade.*—The architrave to be moulded as shown in detail, with three faces, and to be wrought out of solid stones, not less than 3ft. in length, the stones to be joggled together (see sketch *d*, p. 733): the joints to occur where shown in detail. Or—

(If the intercolumnar space is several feet,

rolled iron joists may be introduced, as shown in sketch; or a tied brick arch, or concrete beam with iron bars, may be used in the upper part; and mention should be made of any of these arrangements.)

33. *Frieze.*—The frieze to be solid, and of stones not less than 2ft. in length, and of the full height required to bed-moulding of cornice, and to break joint with those of architrave. (If to be enriched by carving, state) the stones to be 2in. more of extra thickness for the carver. Or—

The frieze to be of ashlar, 4in. or 6in. on bed, and the full height required, allowing 2in. or more on thickness for carving. The ashlar to be bonded every 3ft. or 6ft., and the cavity filled in with lime or breeze concrete or brick in cement. Or—

The frieze to be of ashlar, 4in. (or 6in.) on bed, the stones to be the full height of the member between architrave and bed-moulding of cornice, and to be carved to the architect's detail, for which purpose 2in. (or 3in.) extra thickness to be left, and to be jointed to the brickwork backing with cement (or bonded with a stone every 3ft. or 5ft. apart, to go right through).

34. *Cornice.*—The cornice of entablature to be of two (or three) layers, moulded according to detail, and the stones to be not less than 3ft. (or 5ft.) long, bedded the full thickness of frieze, with truly-worked beds and joints, and to be plugged with lead at the joints (or the stones to be united with slate dowels run in with cement), and the joints set in lime mortar. Or, if enriched, add—

Enriched.—The lower layer, or bed-moulding, to have modillions (or dentils), plain or enriched, which are to be carved after models approved by the architect. The soffit or corona to be sunk panelled.

35. *Balustrade.*—The balustrade (if any) is to be as shown in detail, with plinth, turned (or square) balusters, capping, pedestals, &c., each part solid. The plinth and capping to be in long stones, not less than 3ft. (or 5ft.) long. Each baluster to be dowelled with slate dowels in cement to the plinth and capping, and these are to be plugged with lead, or cramped with metal cramps. Or—

The balusters to be each wrought out of one stone, allowing, at least, an inch of joggle at ends into the plinth and capping. The vertical joints to be plugged with lead, and the capping to be cramped with cast-iron or bronze metal cramps. The half-balusters to be worked out of the same block as the pedestal.

36. *Pediment.*—The pediment to be constructed in strict conformity with the drawings and details; the horizontal cornice to consist only of the corona with the lower mouldings, the stones of both layers to be securely tailed into the masonry for not less than 9in. (or 12in.), and the stones of upper layer to have a length of at least 5ft. The raking cornices to be the same as the main horizontal cornice, and to be jointed as shown. At the springing of pediment the horizontal and raking members to be worked out of one solid block (see sketch), and to be securely bedded into the masonry of wall at least 12in. (or 18in.) The raking cornices are to be in separate stones, bedded in horizontal steps on the masonry behind to a distance of 12in. (or 18in.); or are to be cut in the form of steps. Or—

The raking cornices to be cut with horizontal beds every third stone, the others cut raking. The stones are to be plugged with lead (or dowelled), and the upper layer or moulding to be in stones of not less length than 4ft. or 5ft., breaking joint plugged with lead (or cramped with bronze cramps in cement), and to have a bed the whole thickness of wall, or state how much. The tympanum of pediment to be executed in courses of stone 6in. or 9in., on bed to match the ashlar below.

37. *Staircase Basement.*—The basement staircase to be constructed of 12in. by 6in. solid York stone steps, tooled (or rubbed) on all sides, projecting 3ft. (see sketch, section, Fig. 7, p. 697), pinned 6in. into the wall in cement as the work proceeds, rebated joint (or bedded in cement), two holes to be cut in each step for balusters. The curtail step to be 14in. by 7in., solid with scroll end. The winders, if any, or half-space landings to be 6in. thick, cut and pinned 6in. into wall with cement. The landings to be 3in. (or 4in.) thick, joggled (or grooved and tongued) together in cement. The thresholds of doors on landings to be of hard York 3in. thick, rubbed and back-jointed.

The steps, if solid, may be rebated together as shown, or simply splayed at the angles of contact. For ordinary steps, simple bedding in cement may be specified. Sometimes the holes or mortices in the brick walls are left for the stone steps to be put in after the brick wall is built. These holes or chases should be filled up temporarily with bricks bedded in sand, and the wall carried up some courses above as well as below the stair-line with cement mortar. The outer or free ends of the steps are supported by timber till the cement is set. Landings of wide span are carried by an iron joist under the external edge. Concrete landings with iron imbedded are often used as substitutes, but of these we shall speak in another trade.

38. *Principal Stone Stairs.*—The main staircase from the ground floor to the first (or second) floor to be in a single (or double) flight of hard Portland stone steps, rebated at joints with moulded nosings along the front, outer end (and back of each step). The soffit of each step to be moulded, as shown in detail, each step to be tailed or pinned into the walls 9in. The landings to be 6in. thick, with similar moulded nosings, panelled on the soffit, and to be in one or more slabs tailed 6in. (or 9in.) into walls, and joggle-jointed (or rebated) with lead. Mortise the necessary number of holes for balusters. The bottom step to be cut out of a solid square section with a bold curtail. The whole to be rubbed smooth on all faces and soffits. Or—

The principal stairs to be of Portland stone steps and landings, as shown, tailed into walls 9in., with moulded nosings, and returned nosings at ends and back. The soffits to be moulded to the shape of the ends of the step (or according to detail). The solid steps to be jointed or rebated to 6in. landings with moulded nosings, the latter to have joggled joints run with lead, and to be tailed into wall 4in. or 6in.

FOUNDATIONS AS APPLIED TO LONDON BUILDINGS AND RIVER-SIDE FOUNDATIONS.*

(*Concluded from page* 774.)

THE value of the Greathead system of working enables a running stratum to be broken into without danger. Where buildings and wharfs are situated on the side of a river unsecured, and where the materials of its bed are not sufficiently firm to allow a shelf being maintained between the buildings and the low-water line, the shore may run down and carry the foundation of the buildings along with it. An instance of sand thus running occurred in 1837, during the progress of the Thames Tunnel, notwithstanding the close protection afforded in the shield used by the late Sir Isambard Brunel, the sand running in to such an extent that, at a distance of 50ft. east of the shield, the bed of the river sunk 13ft., bringing the river within less than 3ft. of the level of the excavation, while immediately above very little depression took place. A similar instance of running gravel is recorded when the shield approached the wharf on the Middlesex side, producing a conical depression 30ft. in diameter and 13ft. deep on the shore, followed by a subsidence of the wharf front. In the construction of the Blackwall Tunnel the use of the Greathead shield enabled the work to be successfully accomplished. In the construction of the Metropolitan District Railway between Westminster Abbey and Westminster Hospital the soil was sand and gravel, heavily charged with water, Westminster Abbey itself being on the sand. The nearest point of the works to the main walls of the hospital was 23ft., and to Westminster Abbey 70ft. 8in. The tunnel was made without the slightest settlement of adjacent buildings, notwithstanding the fact that, in wet sand and gravel, pumping was carefully resorted to, in order practically to dry the ground sufficiently for work. By the aid of iron tubing, and the use of compressed air with the Greathead shield, as adopted in the City and South London Railway work, we need experience no anxiety. You can work as safely in gravel charged with water as you can in London clay. The ordinary timbering of a tunnel is a yielding material, so that, unless special precautions are observed, there is a risk for the framework to yield which is employed to temporarily hold up the excavation before the brickwork is put in; but with an iron lining and cement grouting outside, there is no need of alarm. The

DANGER CONNECTED WITH PUMPING

is obviated when it is carefully done. If it is carelessly done, you may draw some of the finer particles of sand and water, and so undermine the foundations of an adjacent building to a greater or less extent. Where any accidents occurred on the construction of the City and Southwark Railway it was near the brick stations, where wood centres were introduced; but by adopting cast-iron lined shafts to the stations with cement grouting outside, any danger to surrounding property is avoided. On the Metropolitan Railway ordinary stock bricks in blue lias lime were used. In the Metropolitan Railway settlements occurred, as it was constructed mainly without an invert. The ultimate improvement was to put an invert, which, of course, gave greater support from the pressure of the sides. The system of construction was in some cases tunnel—near Kensington, for instance—but generally cut and cover. With the use of the Greathead shield upon the Central London Railway, where not in the clay, compressed air is introduced, and the work is entirely in tunnel. The iron plates are properly jointed throughout.

BRIDGE FOUNDATIONS.

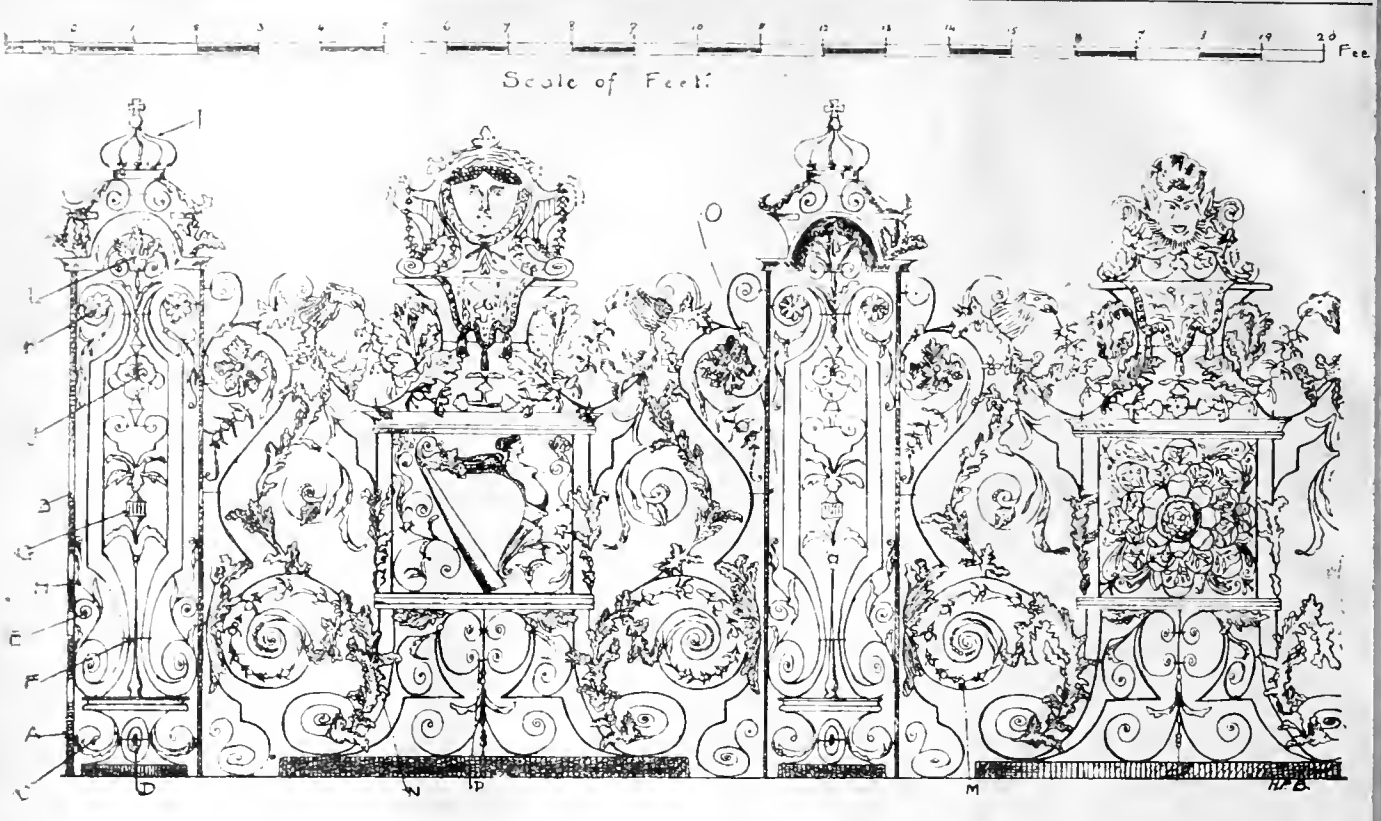
In the King's-road bridge over the Regent's Canal, Camden Town—designed by Messrs. Thomas and Taylor—the foundations were sunk 22ft. below the roadway level, or 11ft. 6in. below the water level in the canal, and 5ft. 6in. below the bed of the canal. The soil from the top of roadway to a depth of 18ft. was found to be of a clayey character, below which was found a seam of clay-stones 1ft. deep, and then clay suitable for a foundation. A trench 50ft. long was made, in which a concrete bed 8ft. 6in. square in section was built, with counterforts added at every 12ft. It was found that this ground could be timbered by experienced men without driving piles, and without pumping beyond the removal of a small amount of soakage while the men are not at work. Old Westminster Bridge, which was built between the years 1738 and 1750, consisted of thirteen principal and two smaller arches nearest the abutments, 25ft. span, all semicircular, springing from the piers at about 2ft. above the level of low water. The central arch was 76ft. span, but the principal lateral arches decreased in width by intervals of 4ft. each, and their intervening piers were supported by caissons consisting of rafts of timbers floated into position and then sunk in place, a level area having been previously dredged to receive them. Each raft was about 80ft. by 30ft. by 10ft. deep, made watertight all round, within which a portion of the pier was built, and the raft was then floated to the site of the proposed pier, the water admitted by sluices in the sides, and the foundation guided to its proper bed by ropes from a light barge previously moored off the shore. None of the foundations, which all rested on a substratum of sand and gravel, were at a greater depth than 14ft. below the bed of the river, and parts were not more than 5ft. or 6ft. The wooden platforms carrying the base of each pier thus ran the risk of settling upon an irregular foundation, and gradually getting undermined as the bed of the river lowers. Originally the piers were intended for a light wooden structure; but when it was determined that the bridge should be built of Portland stone, a stone casing was built around them. The bed of the river on which the caissons rested became undermined, particularly when, in later years, the tidal current, since the removal of the numerous piers of old London Bridge, ran off with greater rapidity than when old Westminster Bridge was erected, and produced a general, though not uniform, lowering of the level of the river bed. A similar plan was, however, followed in the case of old Blackfriars Bridge, built 1760 to 1770, the platforms here employed being 88ft. by 37ft., and two balks and a half thick; but in this structure bearing piles were introduced to obviate the liability to settlement. This bridge consisted of nine arches, elliptical in shape, constructed in Portland stone. The centre arch was 100ft. span, and the side spans decreased gradually to 98ft., 93ft., 83ft., and 70ft. Waterloo Bridge, built in 1811 to 1817, contains nine equal semi-elliptical arches of 120ft. span, and was the first bridge on the river in which coffer-dams were employed. These consisted of double piling, with puddle between, and did their work successfully during construction. Like old Westminster and Blackfriars Bridges, however, the foundations of Waterloo Bridge were left upon sand and gravel, and not carried down to the clay. Each pier was, however, built upon piles, there being one pile to every square yard of bearing surface. The heads of these piles were sawn off, and timber sills or bearing piles and waling

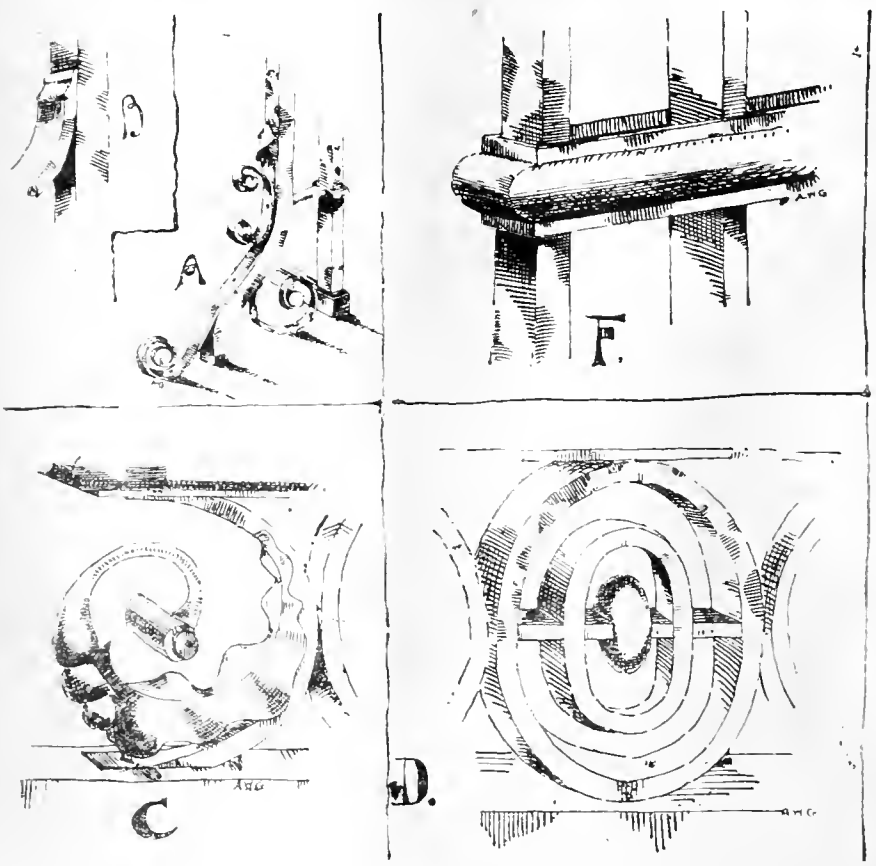
* By ARTHUR T. WALMISLEY, M.Inst.C.E. A paper read before the London Architectural Association on Friday, May 20, 1898.

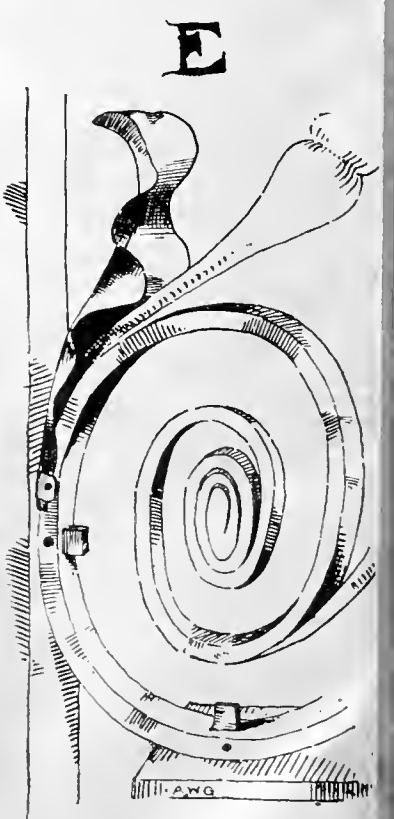
pieces fastened on both transversely and longitudinally, upon which a flooring of 6in. planks was fixed, and then the first course of masonry laid thereon. The system of laying the foundations dry in coffer-dams was followed in Southwark Bridge, and the same plan adopted at New London Bridge, the former built 1814-1819, and the latter 1823-1831. In Old London Bridge the piers were built on platforms supported on elm piles, driven into the bed of the river, and cut off at low-water level. In New London Bridge the foundation consists of timber piles 12in. to 14in. square, shod with wrought-iron shoes, weighing 35lb. each, and heops 30lb. each, driven at intervals of 3ft. 6in. to 4ft. centre to centre, so that 16sq.ft. of masonry are taken by each pile. The bearing-piles are here driven into the London clay about 18ft. below the platforms. The importance of establishing a foundation to resist undermining action cannot be over-rated. Uniform width in a river produces uniform scour, which, while it creates a better channel for the discharge of flood-water, also attacks any impediments it encounters. Since the construction of the Thames Embankment, the bed of the river parallel to the Embankment has varied considerably. In New Westminster Bridge, completed in 1862, the foundation of each pier is entirely piled over with 145 elm piles, driven centre to centre, 3ft. 3in., and 2ft. 6in., passing through the gravel into the London clay, and cut-off below low-water. To avoid the expense of permanent coffer-dams, these piles were surrounded with iron piles connected by cast-iron plates driven between them, known as "plate-piles," so as form a complete casing, the interstices between all the piles being filled in with concrete. They go about 10ft. into the blue clay, and extend about a foot above the gravel bed. Upon these is placed a series of slabs of granite edgeways, the plate-piles being secured by two sets of ranges of iron ties, passing through the pier, and fixed by divers, the granite slabs secured both by the masonry of the pier and by the main piles to which the plate piles are connected. A complete caisson is thus formed, which has caused the necessity of the interior piles to be much questioned. In new Blackfriars Bridge, built 1864-69, wrought-iron caissons were employed for the foundation. Each pier stands upon four independent rectangular caissons, 36ft. by 18ft., carrying the centre of the pier, and two triangular caissons projecting beyond, to carry the cutwaters. These caissons were built upon a stage, and lowered, by the aid of guide piles, into their assigned position, with their cutting edge resting on the bed of the river. The ground inclosed in each caisson was then excavated by divers, and the caissons sunk by being weighted with iron kentledge until the clay was reached, when leakage ceased, and the caisson by pretracted leading took its final bearings at an approved depth of excavation. A material like the London clay is for all practical purposes incompressible, especially when prevented from spreading laterally, and so deep down as to be unaffected by heat or damp. The caissons were then filled with concrete in cement, upon which was placed 8ft. of brickwork in cement, the top of which was at a level of 4ft. below low-water mark. A space of one yard was left between the caisson sections, which was subsequently filled with concrete in cement up to the same level, so as to provide an uninterrupted area over the base upon which each pier now stands, and the movable portion of the caissons above 4ft. below low-water level were removed as the work proceeded. Cylinder foundations were first used by the late Sir W. Cubitt, at Rochester, and their employment has since been efficiently tested to show their adaptability for foundations. They were adopted for the original railway bridge at Blackfriars, 18ft. diameter, below the stone piers. Cylinder foundations, 18ft. diameter below, and 12ft. diameter above, the bottom of the river are used for the piers of the Cannon-street railway bridge. At Charing Cross the cylinders are 14ft. diameter below and 10ft. diameter above the ground. The foundation cylinders of the Albert Bridge at Chelsea are 21ft. diameter, and their mode of fixture is described by the author in the discussion which took place on Mr. Cruttwell's paper at the Institution of Civil Engineers, in which the foundations of the new railway bridge across the Thames at Blackfriars were described, and for which rectangular caissons, sunk 16½ft. to 23½ft. below the river bed, were adopted (see *Min.*, Inst. C.E., Vol. CI.) The Victoria railway bridge over the river at Battersea was originally constructed with piers on the up-river side standing on a bed of cement concrete inclosed by permanent sheet piles driven to a depth of 8ft. below the lowest foundation level; but, when widened, the increased width of foundation was obtained by sinking permanent cast-iron cylinders to a depth of 45ft. below Trinity high water on the down-river side, four to each pier, 21ft. internal diameter, and 24ft. long, cast in segments 8ft. in length, with flanges for bolting together. These cylinders were filled with cement concrete for a depth of 12ft, upon which was laid brickwork in cement up to low-water level, above which level temporary wrought-iron cylinders were employed. The foundation cylinders were united at the top by a framework of cast iron, but the masonry between the cylinders is principally carried by brick arches in cement turned between the cylinders in the hearting of the piers, which from this level to the springing line consist of solid brickwork in cement faced with masonry, so as to present the appearance above low water of a continuous pier.

RIVERSIDE FOUNDATIONS.

In the foundations for the destructor cells and chimney-shaft designed for the borough of Great Yarmouth, concrete blocks were employed, built in brickwork cylinders as shown, and the maximum pressure per square foot on the subsoil was calculated to be 4tons 6¾cwt. The ground is of a very marshy character overlying sand and coarse gravel, into which the foundation is sunk. The cylinders are constructed of 9in. brickwork, built in Portland cement, the lower 4ft. being encased in a wooden drum, with cutting edge sunk into the gravel and sand at least 2ft. The cylinders are sunk by the aid of a grab, the bottom being levelled, and the concrete blocks laid by a diver. In this way the risk involved by pumping, which might disturb the foundations of cylinders already in their places, would be avoided. The blocks are grouted through a 3in. pipe with liquid cement, the joints and lewis holes having been previously filled with coarse, clean shingle. After about four days to permit the grout setting, and thus forming a watertight bottom, the cylinders are pumped out and filled with concrete composed of six parts shingle, one part sand, and one part Portland cement. The remainder of the buildings, which are low, and light in weight, have concrete foundations tied with iron joists and spread to such a width that the subsoil shall not receive a greater weight than half a ton per foot superficial, which, it has been ascertained by experiment, can be carried on this soil after the upper layer of turf and roots has been removed. The Dover Electricity Supply Company erected works adjacent to the River Dour, from which the town is named. These works included a chimney, designed by Mr. F. G. Knight, of Westminster, about 130ft. high, with a concrete base 24ft. 3in. square, by 5ft. deep. The River Tyne at Newcastle affords instructive examples of riverside foundations. The old quay walls, with a depth alongside at low water, varying in the year 1840 from 2½ft. to 5½ft., had a piled foundation, and when in 1866 deeper quays were deemed essential, 12ft. of water at low tide was considered ample, which was subsequently increased to 22ft. Piled foundations were adhered to, until upon the advice of the late Mr. T. E. Harrison, Engineer to the North-Eastern Railway Company, cast-iron cylinders sunk under atmospheric pressure for the substructure of the quay were adopted for new work, as cheaper than piled work. Two rows of cylinders were employed, each 5ft. diameter, placed 25ft. centre to centre longitudinally, the front and back cylinders being surmounted by cast-iron beams, from which masonry and brick arches were turned. Longitudinal metal sheet piling, up to the level of low water, was driven in the form of a segment between the front cylinders, but proved too weak for the increased depth of water, after the bed of the river had been dredged out. The intervening sheet piling was done away with, and a mere continuous front row of cylinders substituted, 13ft. 9in. centre to centre with elliptical cylinders intervening. These likewise proving too weak, a close row of 6ft. front circular cylinders was tried, the back cylinders remaining as before, but tied to every alternate front cylinder by a wrought-iron band passing round both. The same method was adopted under a large grain warehouse built on the quay. Finally, in the rebuilding of part of the 1840 wall, monoliths of concrete were, upon the advice of the late Mr. P. J. Messent, engineer to the Tyne Commission, sunk for the foundation of a wall constructed to give a depth of about 20ft. at low water spring tides, and this plan has since been applied to the reconstruction of all the old quays requiring renewal. The blocks are 30ft. long, 20ft. wide, and 37ft. deep, with a well 20ft. by 10ft., and walls 5ft. thick, forming concrete caissons, sunk to an average depth of about 32ft. 6in. below low water, and are set about 2ft. apart, the interior and also the space between them being filled with concrete. On these blocks the masonry and concrete superstructure was built. Concrete cylinders have, upon the advice of the late Sir John Coode, been employed by his successors, Messrs. Coode, Son, and Matthews, for the foundation of the abutment to the new east pier to the Outer Harbour Extension at Dover. These cylinders were cast upon a lower seating ring 12in. deep, to form a cutting edge, the cylinders being 7ft. external diameter, 15in. thick. They were cast in wood moulds with 5 to 1 Portland cement concrete, and were allowed to set at least ten days before lifting, and to season one month prior to removal from the yard to their destination. The top and bottom edges of all intermediate rings are toothed 6in. deep, and tapered 1in., so as to key into each other when sunk *in situ*. The cast-iron cutting edge shoe is bolted into the bottom ring by 1in. bolts, let in flush at the top. The interior concrete is placed in position by means of skips, so arranged as to deposit the contents as close as possible to the concrete previously deposited. Between this abutment and the old north pier of the existing harbour entrance a sea-walls exists, built by the late Mr. James Walker as engineer, in which a row of cast-iron sheet piles were driven at the toe of the outer slope between the wall and its apron. Messrs. F. and H. F. Higgs built, in Upper Thames-street, a warehouse with a river-wall going down about 10ft. below the river-bed, which was easily effected by means of the usual cofferdam of 12in. piles planked each side with clay puddle between, notwithstanding the fact that in sinking the other foundations a brick sewer running parallel to the river, about 40ft. from the bank and at about 15ft. down, constructed by the District Railway Company to drain their tunnel, was encountered. At Stratford the premises built by this firm were against one of the many tidal cuts in that district; hence a river-wall had to be constructed. This Messrs. Higgs managed with light piles and single planking, with tarred and tongued joints belted outside the piles—a construction sufficient to resist quiet water of no great depth. The Horse Shoe Wharf in Upper Thames-street, built by Messrs. Holland and Hannen, was erected in 1888 and 1889 for Messrs. Pilkington Bros., glass manufacturers, by Messrs. Francis Chambers and Son as architects. The frontage of this warehouse is about 82ft., the river wall going to a depth of 30ft. below the average high water level, the basement floor being about 6ft. below high water level. In excavating for the foundation, the strata passed through was made ground 12ft, wet mud, dirty gravel, old piles and previous foundations, shells and silt, lastly, clean ballast. In order to build the river wall, a coffer-dam was formed by driving in two rows of 12in. by 12in. pitch-pine sheet piling 6ft. apart. The piles were strapped together and the rows securely laced together with iron ties. The space between the sheeting being filled in with clay puddle, and the whole construction firmly shored from the ground at the back. A shield was provided in the dam at shore level as a precautionary measure for draining off, as the tide receded, any sudden rush of water that might have accumulated within the dam through extraordinary flood or other tides. In this instance the whole area of the basement, occupying between 15,000 and 16,000 square feet, was excavated at the same time. A deep sump-hole was formed, and a steam chain-pump kept constantly going to keep the excavation clear of water until the permanent river wall was constructed. It may be interesting to note that while getting out these excavations, the old Kentish rag foundations of Baynard's Castle, which occupied the site in the time of Queen Elizabeth, were discovered. The river wall of Brook's Wharf, Upper Thames-street, was built tide work by Messrs. Holland and Hannen. A sound foundation was obtained at a depth of 14ft. below the level of the shore, but no record has been kept of the class of soil passed through. The excavation, concrete, footings, &c., were carried







out in short lengths, as in underpinning, during the time the tide was out, and the work done was carefully covered up or cased in before the water reached it. The casing of brickwork, &c. was in no way watertight, but was sufficient to prevent the washing action of the tide. This is an economical method of constructing a river wall, but of necessity rather slow, and can only be adopted in particular cases. In 1880 the same firm constructed a quay wall to their own property in Nine Elms-lane. The length of wall was 100ft., and height 18ft.; this was also carried out by tide work as in the previous case, but is constructed entirely of Portland cement concrete. This is a very inexpensive form, costing between £4 and £5 per foot run complete.

IRONWORK AT SOUTH KENSINGTON MUSEUM.—V.

By G. A. T. Middleton.

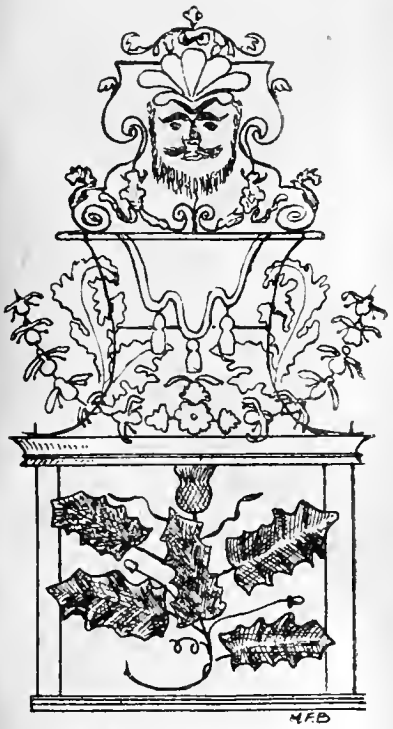
VI.—ENGLISH: THE HAMPTON COURT SCREEN.

THE famous Hampton Court screen, designed by Jean Tijou, and supposed to have been wrought by Huntingdon Shaw, of Nottingham, about 1693 A.D., is, considering its actual massiveness and power, distinctly disappointin when reduced to a small-scale fine drawing. I grandeur lies in its exquisite workmanship ar in its wealth of foliage ornament more than the outline of its design, and the effect is en hanced by the details being in bold relief, ar the enrichment being mostly duplicated, ar applied to both sides of the screen alike.

The detail drawings show that the curv are of a rounded character, that the structu work is of bar and sometimes moulded iron, a that much use is made of the pin or rivet, t most peculiar connections being those shown C and E.

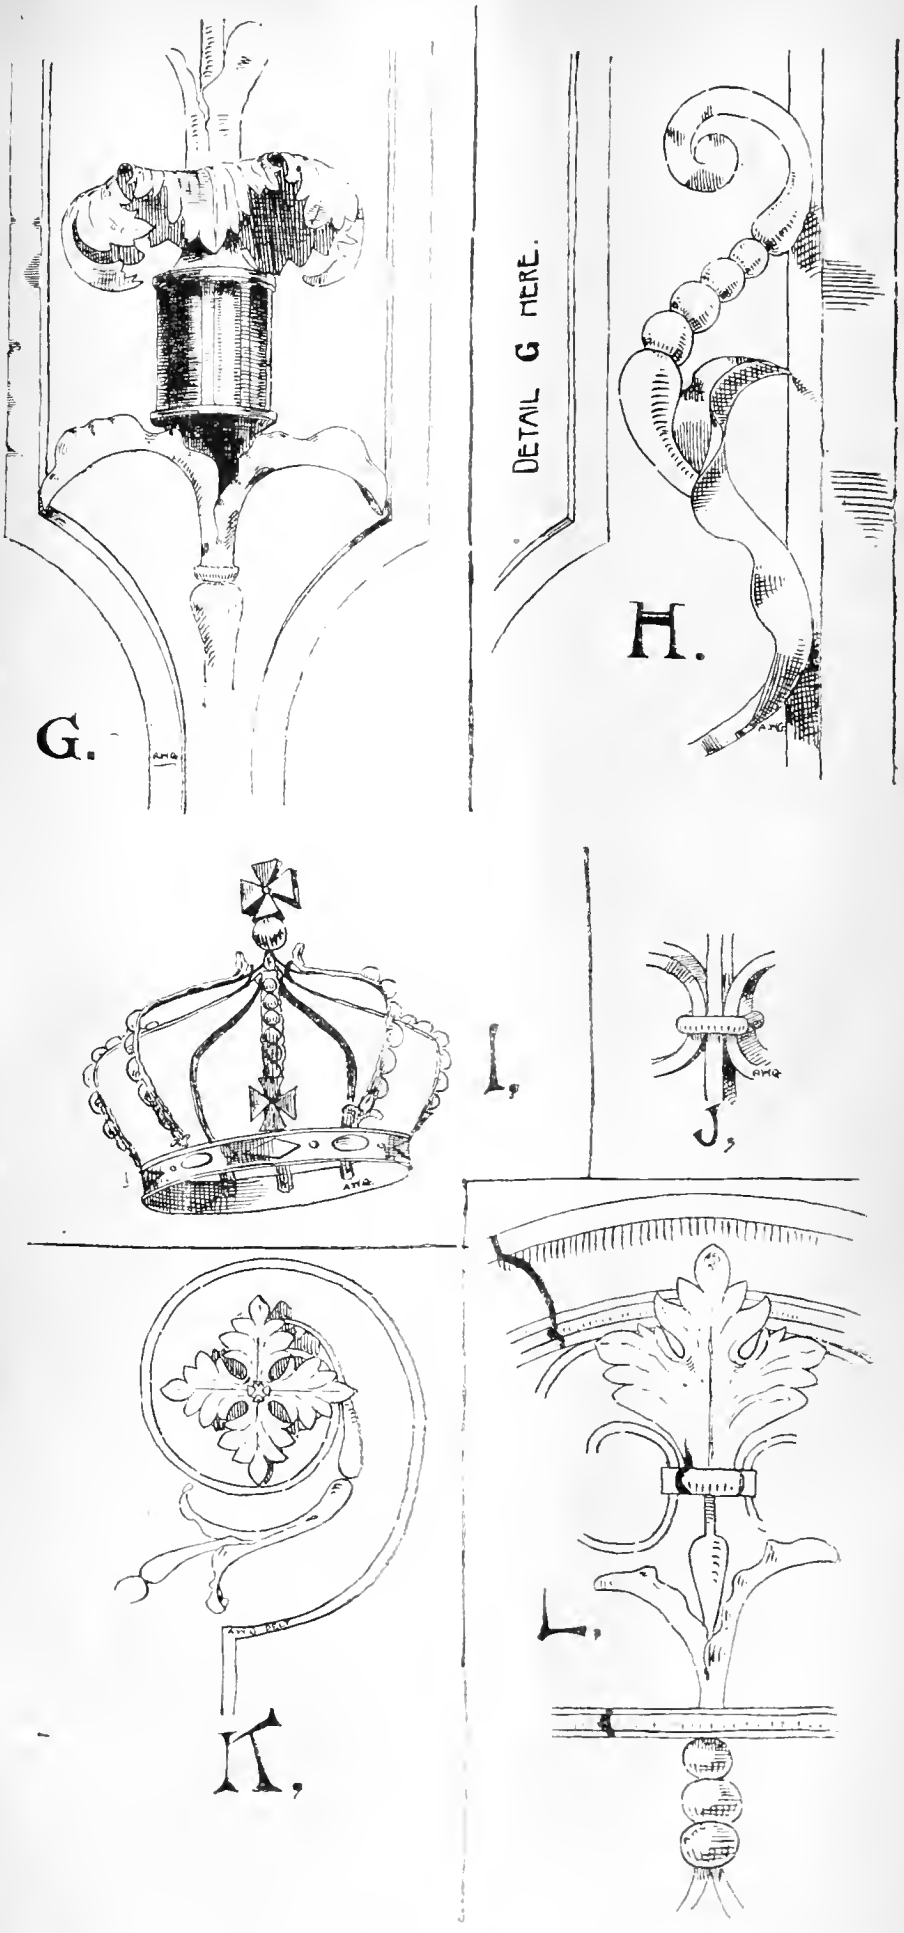
GASWORKS MACHINERY.

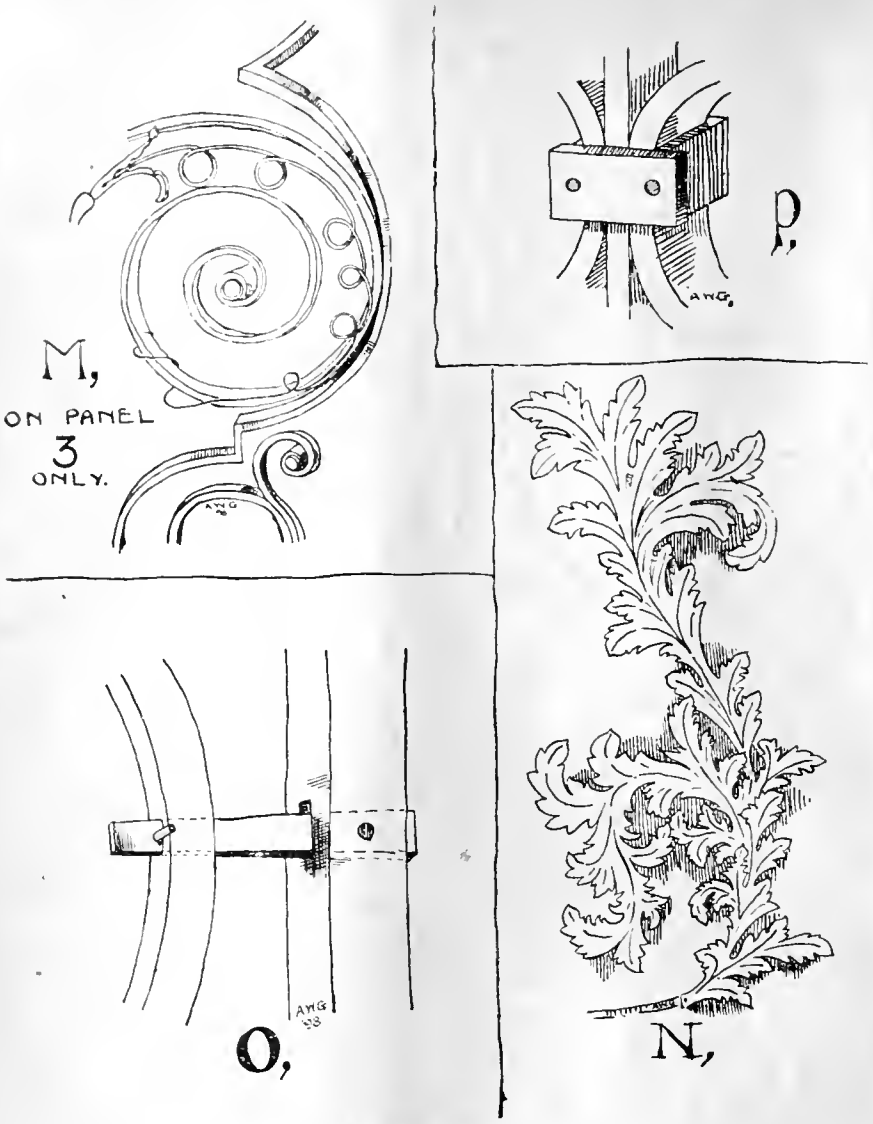
AT a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening, June 6, 1898, a paper was read by Mr. Edward A. Harman, entitled, "Gasworks Machinery." The author first pointed out the close relationship of gasworks machinery with other branches of engineering. Attention was then directed to the deteriorating influences to which gasworks machinery was subjected, on account of coal and coke dust, and the presence of miscellaneous waste gases. The author pointed out the severe conditions under which some portions of the machinery had to be operated, such as the handling of red hot coke at a distance of 2ft. or 3ft. from the face of the machine: he also referred to the influence of contraction and expansion on the various parts of the machinery, due to working under variable temperatures. Attention was then drawn to the special objects of gasworks machinery. Continuous carbonisation was referred to as having been experimented with, but had not resulted in being adopted. The erroneous impressions of the arduous nature of retort house work as now existing were referred to, and it was stated that if a comparison could be made with labour in other works a different idea would prevail. Attention was then called to the



CENTRE OF THIRD PANEL.

numerous novelties existing in gasworks. The magnitude of the operations required to be performed by gasworks machinery was shown by the carbonisation of 12¾ millions of tons of coal in the United Kingdom annually. The exhausting plant used was explained at length: the author combating the common erroneous idea that atmospheric air was drawn into the gas, and explaining the functions of the exhausters for drawing the gas from the hydraulic main, leaving the dip pipes always sealed: and for forcing the gas through the purifying apparatus: and also for raising the gasholders. The difficult duty required from pumps was referred to—viz., that of having to raise substances ranging from light spirits to almost thick solid matter, at various temperatures from zero to nearly boiling point. The coal and coke stacking operations were then reviewed, attention being called to Mr. Marshall's extensive installation at one of the Copenhagen gasworks, for the Danish Gas Company, which is capable of unloading and stacking about three quarters of a millions tons of coal in six months. The Temperley transporters were also described. Coke conveyors were considered, special reference being made to that designed by Mr. Henry Hack, M.Inst.C.E., at one of the Birmingham gasworks, and to the design of M. de Brouwer, of Bruges. Coke breakers with circular steel sheets were stated to be most desirable for cutting the coke, instead of crushing it. Gas engines and tramcar motors were also considered. Regenerative furnaces were stated to be considerably reducing the consumption of fuel on gasworks, while giving higher heats and vastly better working results. Lifting and travelling apparatus for purifier covers was stated to be generally worked by





THE HAMPTON COURT SCREEN.

hydraulic power. The recovery of the large quantity of waste upon gasworks was mentioned as being gradually coped with, such as the quantity of gas lost during the operations of charging the retorts, the coke dust, spent lime, waste hot water from various processes, and also the unrecovered cyanides in the coal gas. Stoking machinery was dealt with at length, Mr. West's compressed air system being first described, and afterwards the Arrol-Foulis system. Coal breakers, elevators, and conveyors were also described. The depreciation of gasworks machinery was regarded by the author as not being greater than with other machinery, as the wear and tear of the renewable portions had to be made good as required. The author, in conclusion, stated that he considered that rule of thumb methods were rapidly giving place to systematic methods and design. The paper was very fully illustrated.

THE COLLAPSE OF A BASEMENT VAULT AT MARYLEBONE.

DR. DANFORD THOMAS held an inquest on Saturday respecting the death of George Unicine, twenty-two, bricklayer, of Paddington-street, Marylebone. Robert Leggatt, foreman to Messrs. H. Burman and Sons, said his employers were rebuilding the Devonshire Arms tavern, Devonshire-street, Portland-place, and on Thursday Unicine and another man named Daniel Mackie were working in the basement of the premises. The vaults of the tavern extended under a mews beside the house. Unicine and Mackie were putting in a pier through the vaults, in the wall of one of which a crack was discovered. As soon as it was discovered, someone shouted, "Look out; here it comes." The arch of the vault and wall then fell in, burying Unicine beneath a superincumbent mass of wreckage. The Coroner: Do you think since these building operations have been in progress anything has occurred to lessen the strength of the arch? Witness replied that the foundations of sandy soil might have been affected by the heavy rain, and hence the collapse. The pier was being put in 10ft. distant from where the crack showed. Shortly before this some heavy loads had passed over the crown of the arch. The man was extricated as speedily as possible, but life was then quite extinct. Replying to Mr. Crabtree, inspector of factories, the witness said the bed of the old brickwork rested on nothing but sand. None of the shoring gave way. Daniel Mackie, bricklayer, who was working with Unicine, said there was no shoring in the vault, as there should have been. Witness added that he made no complaint to the foreman. The bricks were soft and rotten. They were about 100 years old. Mr. A. Ashbridge, district surveyor, said he approved the plans for reconstructing the Devonshire Arms, and considered the works were turned out satisfactorily. His belief was that when the hole was dug for underpinning, the sandy foundation gave way, probably owing to recent rain, and so weakened the side wall of the arch. Mackie was wrong as to the age and condition of the old brickwork. But for the rain witness did not think the accident would have occurred. Mr. Crabtree, on behalf of the Home Office, stated his conviction that the brickwork was good; but that, owing to the heavy rains, the sand foundation had eased down and caused the accident. The jury returned a verdict of "Death from an accidental cause."

The tender of Mr. W. A. Linton, at £7,350, has been accepted for building the new church of St. John the Baptist, on Risca-road, Newport, without the tower. The foundation-stone will be laid on Monday, the 20th inst.

"BUILDING NEWS" DESIGNING CLUB.

DINING-ROOM OAK FURNITURE AND CHIMNEYPIECE.

BUNGALOW furniture, for which uses the accompanying pieces are intended, should be distinctly plain and simple in character. Its construction should be straightforward, and, if anything, ought to be more like joiners' work than favour necessarily the productions of a cabinet-maker. This remark applies less, of course, to the chairs, for, indeed, chairs in any case are the speciality of the chair-maker. We suggested that the furniture designs to be submitted in this competition should be suitable for the living-room of the Bungalow, which formed the subject of the previous "B. N." D. C. contest. The three best designs for the Bungalow itself were illustrated in our pages for May 20th, and it will now be seen that the author of the plan placed first on that occasion is the designer of the furniture which we have chosen as the best proposal to-day. This circumstance has not in any way influenced our choice, however; in fact, it was not till after we had determined on the order of merit of these furniture designs that we became aware, by reference, that "Centaur's" plan for the Bungalow had been awarded the post of honour. "Nothing succeeds like success"; but we are far from saying that these furniture designs by "Centaur" are everything that could be desired, or that their success is unqualified. The second degree of merit is accorded to "Pantile" and the third position is taken by "Hotspur." The following are the instructions issued for the use of the competitors:—A suite of oak furniture and chimneypiece, suitable for the living-room of the Gentleman's Bungalow which formed the subject for the sixth and last competition of our Designing Club. The room is 24ft. long by about 18ft. wide. The chimneypiece is to have a fire 18in. wide. The whole composition is to be 4ft. 6in. wide, and the total height is to be not less than 7ft. 6in. including the overmantel. A good shelf is to be provided, and tiles are to be introduced round the slow-combustion firegrate. The table is to be suitable for a dining-room. One armchair, with leather seat, and a sideboard. This latter is to be 6ft. long, and have cupboards and drawers below, with buffet shelves above. The entire height is not to exceed 5ft. Style left to the competitors. Scale for general drawings, inch scale, and details quarter full size. Plans sufficient to show the design, and armchair may be shown only by a view. A view of the buffet is desirable.

Very few members responded to the invitation thus afforded for their display of inventiveness, and while many architects complain, not infrequently, that clients do not often give them an opportunity of designing furniture for the buildings erected from their plans, it is quite clear that only a very few architects devote any attention to the subject, although furniture must always of necessity play a most important part in the success or failure of a building, judged as a whole as a work of art. Pupils in the majority of offices seldom or ever see any furniture designs produced by their principals, and experience has shown what dreadful stuff some men, calling themselves architects, have turned out in the way of board-room and other furniture, sometimes called by the passing phrase of "fitments." This being the case, we think those members of our club who have risen to the occasion by sending in designs for this suite of oak furniture deserve commendation, because in all probability they have individually gone beyond the routine limits of the particular offices in which they may be working, and have studied furniture apart for its own sake; and possibly they have done so with the idea of qualifying for an extended sphere of usefulness. If so, they are wise. There can be no doubt that there is plenty of scope remaining for the gifted designer in this branch of decorative design, and while originality of idea is of prime importance, good taste and a keen sense of fitness is even of more value. Architects at the best are so accustomed to planning structural woodwork, that they are liable, more or less always, to make the scantlings of the furniture they design too big and massive, an error in some sense on the right side; but the furniture thus designed is generally ineffective and faulty in the essential element of proportionate scale. "Centaur's" sideboard is an example in point, though, as we have already indicated, the rough-

d-ready freedom of Bungalow life undoubtedly es suggest an avoidance of delicate detail and ultiplicity of parts. The inclosed ends above e table-top prevent the ready use of a buffet oth on the sideboard. The plans and sections e shown in a workmanlike manner, so that her the chimneypiece or sideboard could be adily made by any skilful joiner. The Gesso nels in the overmantel would be another matter, d unless a really capable artist designed them, e effect would be quite spoiled. Executed with ste, no doubt they would be spirited and very etty. Three good figures in illustration of me fancy or poetic idea would much enhance e interest of the design, of course. "Pan-e's" designs are distinguished by a tasteful serve, and they harmonise in their un-mbitious simplicity. The sideboard is not quaint, however, as to avoid the com-onplace. The proportions account for this, d the long shapes of the glazed cup-oard doors in the upper part seem very un-ainly. An absence of fuss is welcomed by fined taste, but an interest is always imparted some display of a quiet fancy. The panels to e cupboards in the body of the piece are so ry meagre, and the same remark applies to the per portion of the chimney-piece. A little genuity of structural framing or mitring of the ouldings would have sufficed to impart a trifle ore interest even for a Bungalow. The heart-aped device is introduced rather nicely in the ode we are suggesting. "Hotspur" is more dinary, and does not draw so crisply. His imney-piece is not lacking in refinement, but e overmantel piles itself up in tiers without ncentration of interest. An unqualified set of geon-holes in a way has an air of fitness, and resser-like shelves for holding a display of fine ue ware can be made to look admirable, a quiet setting for real works of art. We ake no objection to repeats as such; but when, in this case, a composition is made of the sign by a series of shafts, cornices, and a big ntral opening, the side recesses become piers to e middle portion, and emphasis of scale is ndered desirable in their parts: otherwise, the hole thing resembles the piling up of cigar-xes in idea. "Hotspur" brings his table-legs ght out to the corners of his table: the same ult is noted in the two best designs. It is ways an advantage to get the legs away from e angle of a dining-room table, out of the way the servants' feet when serving, and, of course, e legs should be out of the way of those sitting the table. "Byd" contests the third place mewhat sharply with "Hotspur," for in me respects "Byd" is the better man of e two. However, we have taken as compre-nsive a view as we can. "Byd" draws thinly d without much spirit. His care and endeavour do well we have duly noted, though the per-ective of his table-legs is not so careful as it ght have been. The chimneypiece has a dual ched recess, divided by Jacobean columns tween broad fluted pilaster stiles at the ends. he sideboard buffet is needlessly lumpy in its rts, and crude in its massiveness. "Dachs" more ambitious with a frieze over his fireplace, ggestive of hunting. Above the curved shelf curs a series of figure panels, indicative of other orts, we presume. The copper hood to the wer is not very pretty; but the general notion the composition, with its curves on plan, shows study of the parts which merits approval. The leboard is not very nice, and its details are poor.

HE BUILDING TRADES DIRECTORY.

N the new (eighth) edition of *Kelly's Directory of the Building Trades*, which is a portly lume of considerable thickness, and is now solutely indispensable in the office of every chitect and contractor, and all engaged in ades connected with building, some useful facts e summarised in the preface. It is assuring to told that the present position of the building ades is very prosperous, and the editor quotes a port of the Central Association of Master ilders of London, in which the future pro-ects of the trade appear very satisfactory. he unfortunate engineering strike of last year s no doubt been felt; but the building trades the whole have not suffered. Notwithstand-g the great loss and privations sustained, the port states, "Petty strikes of plasterers have curred in a number of firms, and the re-nstrances of the council and committee have been either met by evasions or the *non possumus*, and though no serious inconvenience has resulted, undoubtedly loss and annoyance have been inflicted." The report continues: "The conduct of all the trades appears to be determined by considerations more or less Socialistic and Communistic, and without regard to the reasonable and proper relationships which should exist between the employés and their employers, and the entire absence of any recognition of the obligations on the part of the former to give a fair day's work for wages received; but, on the other hand, to rather regard what they get from the employer as lawful plunder." These are rather severe strictures, and we hope some better explanation can be found. The editor speaks also of the important works undertaken in London by the L.C.C. and London School Board in the erection of workmen's dwellings, &c., the developments in sanitary and electric science as they affect building. The statistics quoted are of interest. It is stated that the amount of timber used in building imported into this country during 1896, including hewn, sawn, house-fittings and joiners' work, &c., was 8 464,282 loads, valued at nearly nineteen and a quarter millions. These totals show a large increase in every description since 1893 of timber imported, and about two millions in value. The above returns are exclusive of mahogany and hardwoods. The exports are also large. Cement is estimated in tons at 353,769, valued at £580,417; lead, rolled sheet, 22,537 tons, valued at £309,849; painters' colours valued at £1,658,180; and slates tale at 30,439,000, valued at £190,984. The total value of stone of all kinds raised in this country is between seven and eight millions, and of slate and slabs produced under the Mines Acts 581,760 tons. The importation of stone, marble, and slate into this country is given at a total of 673,206 tons. The number of persons engaged in building in London alone is estimated at a total of 120,434, including the various trades. Architects alone number 2,024, surveyors 1,271, builders 8,866. Carpenters and joiners number 32,332, and painters and glaziers 32,666; the other trades show smaller numbers. Throughout England and Wales, the number of architects is computed at 7,842, surveyors 5,836, and builders 37,815, and these last find employment in the various trades for a total of 686,752. Other trades connected with building are enumerated, such as those engaged as stone, slate, and tile dealers, stone quarriers, cutters and dressers, lime-burners, cement manufacturers, paviors, labourers, &c.

ARCHITECTURAL METAL-WORK.

THE artistic metal-work of Mr. George Wragge, the Wardry Metal Works, Salford, Manchester, and Surrey-street, Strand, is well known to the readers of the BUILDING NEWS. Last week we drew attention to his very interesting stand of decorative metal-work at the Art Metal Exhibition at the Royal Aquarium, and we now call attention to his newly-published illustrated catalogue, which comprises several branches of metal-work of value to the architect. The casements and frames made by Mr. Wragge are of superior design and workmanship. The designs include a registered design (No. 19) in steel, iron, and bronze, guaranteed watertight, to open outwards, with full-size details of frame and casements, showing the mode of fixing to the stone jambs and mullions, the grooved frames and water-tight sill. The No. 20 section in steel, iron, and bronze is similar, but the casement frame has two grooves. The outer frame is sunk, so that a bar can be fitted, and the straight joint avoided. Other sections are illustrated suitable for different windows: many are made to open inwards or in and out, and to swing on pivots. We advise all architects to consult this catalogue before specifying. Forms of specification are given. Top-hung casements are also shown. These sections are perfectly watertight, and a special channel for condensation is shown on the inside of the sill of the inside opening casement with a bronze weather-bar on the outside. Many of the ordinary forms are illustrated, and these are made in two different qualities. These fittings can be made to suit wood casements. The sections for wrought-iron and steel sections are useful. Several forms of windows in wrought steel, with mitred joints, and cast iron; hospital and other metal windows, with secret opening gearing, are illustrated in subsequent pages. The designs for wrought handles to metal and wood casements are very artistic and simple; also the back plates taken from old examples in hammered iron. Attention may be directed to several illustrations of very pleasing designs for park gates; door furniture in bronze, copper, brass, pewter, and aluminium; cabinet metal-work in the above metals, repoussé and beaten work, ecclesiastical metal-work and screens; dog grates, vanes and terminals, electric light and gas fittings in various metals, in hammered metal or cast. Full particulars and prices are given for many of the departments.

ART METAL EXHIBITION AWARDS.

THE following is a list of the awards in the Designs Competitions, at the Art Metal Exhibition:—

No. 1.—A street lamp-post for electric light; scale 3in. to the foot. No award.

No. 2.—A wrought-iron open panel, 2ft. 6in. by 1ft. 6in.; scale full size. Silver medal, V. Shaw, 105, Hungerford-road, London, N. ("St. Eloc"); bronze medal, H. Ramsdale Tucker, Hazlemere, Green-lane, Northwood, near Rickmansworth ("Tuclarke"); certificate, Hugh Stirling, 12, Vauxhall-street, Dudley ("Reversible").

No. 3.—A weathercock, 7ft high, on 6in. square lead-covered post; scale 3in. to the foot. No award.

No. 4.—Repoussé coal scuttle in copper; scale full size. Bronze medal, Herbert C. Maw, Severn House, Coalbrookdale, Shropshire ("Utility").

No. 5.—Pair of wrought-iron carriage gates and piers, opening to be 10ft. wide; scale 1½in. to the foot, with necessary details full size. Silver medal, T. R. Spence, 28, Newman-street, London, W. ("Memser"); bronze medal, Arthur Manock, Benfield House, Boscombe Park, Bournemouth ("Practical").

No. 6.—Wrought-iron grille, 12in. high by 8in. wide, in solid oak door, with hinges, lock-plate, and knocker; door 4ft. wide and 8ft. high; scale 3in. to the foot. Details full size. Silver medal, A. Harold Smith, 4, Fairlop-road, Leytonstone, Essex ("Wessex"); bronze medal, Chas. R. Warren, 17, Pepper-street, Chester ("Hindoo").

No. 7.—Wrought-iron ornamental open screen with door in centre, dividing a hall in residence; the hall 18ft. wide and 12ft. 6in. high; scale 1in. to the foot, with necessary details full size. Bronze medal, Albert Waldron, 21, Russell-road, Bowes Park, London, N. ("Heron"); certificate, Herbert W. Doe, 30, Speenham-road, Stockwell, S.W. ("Nature in Art").

No. 8.—Wrought-iron brass casket with enamel panels; its object is to contain the freedom of a City to be given to a General who has served Her Majesty successfully in India; scale full size. No award.

No. 9.—Metal end of a coach-pole for a Mayor's State Carriage; the City is a seaport; scale full size. No award.

No. 10.—A brass repoussé book-cover; the book is the "Pilgrim's Progress," its size large quarto, scale full size. Certificate, Chas. Wm. Crosby, Broome Hurst, Dorking, Surrey ("Appollyon").

No. 11.—A grille, to fill a semicircular arch 10ft. wide; the design is to be executed in wrought iron, and is to contain a central feature; it is suggested that electric light might be incorporated in this feature, but it is not compulsory; scale 3in. to the foot. Silver medal, R. Quilter Lane, 73, Hammersmith-road, West Kensington ("Anchor"); bronze medal, Hugh Stirling, 12, Vauxhall-street, Dudley ("Ling"); certificate, Mary Gondir Simpson, 199, Camberwell-grove, Denmark Hill ("Bulger").

No. 12.—A lectern in brass or iron, suitable for a parish church; scale 3in. to the foot. No award.

No. 13.—Wrought-iron balconette, 4ft. wide, projecting 3ft., and supported by cantilevers; scale 3in. to the foot. Silver medal, A. Harold Smith, 4, Fairlop-road, Leytonstone, Essex ("Wessex"); bronze medal, Herbert C. Maw, Severn House, Coalbrookdale, Shropshire ("Bull Rest").

No. 14.—Ornamental guard to prevent flower-pots falling into the street from the window-sill; drawing need only show two-thirds in width of the design; scale full size. Bronze medal, A. Harold Smith, 4, Fairlop-road, Leytonstone, Essex ("Wessex").

No. 15.—Cast-iron stove and mantelpiece with overmantel: fire, 14in.; mantel-shelf, 4ft. 6in. long; total height not to exceed 7ft. 6in., including overmantel. Plan, front elevation, and end elevation; scale, 1in. to the foot. Details, full size of mouldings and enrichments sufficient to illustrate design. No award.

No. 16.—A ewer and basin, soap dish and sponge basin; full size. No award.

AWARDS FOR CRAFTSMANSHIP.

A bronze medal and certificate: F. G. Francis, 37, St. Michael's-street, Folkestone; R. Western, 5, Bravington-place, Harrow-road, W.; A. W. Elwood, 9, Kennington Park-gardens; Annie Williams, 334, City-road, E.C.; Central School of Arts and Crafts, 316, Regent-street, W.

A certificate: Thomas Taylor, 16, Sales-street, Pye Bank, Sheffield; Wm. Steer, 64, Longhedge-street, Battersea, S.W.

PROTECTION AGAINST FIRE IN THE CITY.

THE city engineer (Mr. D. I. Ross) has reported to the Corporation on the great fire in Cripplegate. In regard to improved facilities for dealing with outbreaks of fire, he points out that there are four brigade stations in the City—viz., Watling-street, Victoria Embankment, Whitecross-street, and Bishopsgate-street. In addition there are 15 sub-stations, at which men with hose-carts and other appliances for fire

extinction are always in attendance. The Corporation at their own expense laid down a complete system of fire-hydrants in the City. These hydrants, each of which has two outlets, are 829 in number, and are constantly charged with water at good pressure. It is the custom universally outside the City to indicate the position of the fire-hydrants on the nearest building by an enamelled iron tablet with the letter "H" inscribed thereon, and Mr. Ross urges that that system should be introduced into the City. As to stop-cocks for shutting off the gas supply, there was some doubt as to whether it would be an advantage, in the case of fire, that either the fire brigade or the workmen of the gas company should have means of readily cutting off the gas without having to enter the premises. It would be a source of danger if stop-cocks were placed outside buildings, for evil-disposed persons might turn off the gas and extinguish all the lights, and the turning-on the gas again might lead to serious accidents. There are 27,827 houses in the City, and it is a matter for consideration whether stop-cocks on the footways might not in time become, by getting slippery, a serious source of danger and inconvenience to pedestrians. There are altogether 35 fire-alarms fixed in the City, all fixed and maintained by the Post office. Indicators might be placed on adjacent lamps without much expense.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE ANNUAL ELECTION OF OFFICERS.

At a business meeting of the Institute held on Monday night the Council for the year of office 1898-99 were declared to be duly elected as follows:—

President:—*Professor Aitchison, R.A.

Vice-Presidents:—*William Milner Fawcett, M.A.Cantab., F.S.A.; *Henry Louis Florence; *Ernest George; and *Edward Augustus Gruning.

Hon. Secretary:—*William Emerson.

Members of Council: — *John Belcher; *Thomas Blashill: *James Brooks: *John McKean Brydon: *William Douglas Caröe, M.A.Cantab., F.S.A: *Campbell Douglas (Glasgow); *John Alfred Gotch, F.S.A. (Kettering); *Alexandra Graham, F.S.A.; *Benjamin Ingelow; *Edward William Mountford; *Beresford Pite*; *John Slater, B.A.Lond.; *Percival Gordon Smith*; *Richard Phené Spiers, F.S.A.; *Henry Heathcote Statham; *Leonard Stokes*; *Paul Waterhouse, M.A.Oxon.; and *Aston Webb, F.S.A.

Associate-Members of Council:—*Arthur Smyth Flower, M.A.Oxon., F.S.A., and *Henry Thomas Hare*.

Representatives of Allied Societies:—*Robert Isaac Bennett* (Manchester Society); *William Larkins Bernard (Bristol Society); *Albert Nelson Bromley (Nottingham Society); *John James Burnet*, A.R.S.A. (Glasgow Institute); *Thomas Drew, R.H.A. (Royal Institute of Ireland); *Charles Busteed Fowler* (Cardiff, South Wales, and Monmouthshire Society); *James Hine* (Devon and Exeter Society); *Leslie Ower (Dundee Institute); and *Albert Edwin Sweday* (Leicester and Leicestershire Society).

Representative of the Architectural Association (London):—*George Halford Fellowes Prynne*.

THE STANDING COMMITTEES.

The following Fellows and Associates were declared duly elected to serve on the respective Standing Committees for the ensuing year of office, viz.:—

ART STANDING COMMITTEE.

Fellows.—*John Macvicar Anderson, F.R.S.E.; *James Brooks; *John McKean Brydon; *William Douglas Caröe, M.A.Cantab., F.S.A.; *Ernest George; *Edward William Mountford; *Beresford Pite; *Henry Heathcote Statham; *Alfred Waterhouse, R.A., LL.D.; and *William Young. *Associates.*—*Robert Shekleton Balfour; *Owen Fleming; *James Sivewright Gibson; *Henry Thomas Hare; *George Campbell Sherrin; and *John William Simpson.

LITERATURE STANDING COMMITTEE.

Fellows: *Henry Louis Florence; *Alexander Graham, F.S.A.; *Benjamin Ingelow; John Tavenor Perry; *William Alfred Pite; *Sydney Smirke; *Richard Phené Spiers, F.S.A.; *Henry Heathcote Statham; *Paul Waterhouse, M.A. Oxon.; and *Ralph Selden Wornum*. *Associates:* *Arthur Thomas Bolton; *Arthur Smyth Flower, M.A.Oxon., F.S.A.; *Andrew Noble Prentice; *Ravenscroft Elsey Smith; *Leslie Waterhouse, M.A.Cantab.; and *Percy Scott Worthington, M.A.Oxon.

PRACTICE STANDING COMMITTEE.

Fellows: *Thomas Batterbury; *Samuel Flint Clarkson; *Thomas Harris; *George Hubbard*; *Alexander Henry Kersey; *Joseph Douglass Mathews; *Walter Hilton Nash; *James Osborne Smith; *Charles James Smithem*; and *Edmund Woodthorpe, M.A.Oxon. *Associates:* *William H. Atkin-Berry; *Charles Henry Brodie; *Francis Thos. Wilberforce Goldsmith; *Herbert Hardwicke Langston; *Augustus William Tanner; and *William Henry White*.

SCIENCE STANDING COMMITTEE.

Fellows: — *Lewis Angell, M.Inst.C.E; *Hampden William Pratt*; *John Salmon Quilter; *Herbert Duncan Searles-Wood; *William Howard Seth-Smith; *Percival Gordon Smith*; *Alfred Saxon Snell*; *Lewis Solomon; *William Charles Street, Assoc.Inst.C.E.; and *Benjamin Tabberer. *Associates:* — *Sydney Benjamin Beale; *Henry William Burrows; *Max Clarke; *Bernard John Dicksee; *Matthew Garbutt, Assoc.-M.Inst.C.E.; and *George Pearson.

Auditors:—Messrs. *Zeph. King* and *Frederick William Marks*.

THE PROFESSIONAL PRACTICE AS TO THE CHARGES OF ARCHITECTS.

The Council submitted the following revision of the well-known "Schedule" of professional charges sanctioned by the Institute as far back as 1872, and confirmed at a general conference of architects of the United Kingdom held in that year. By reference to the existing schedule, it will be seen that the document is to a very large extent recast, and the number of clauses is reduced from 20 to 18, while all reference to the terms of payment adopted by H.M. Office of Works is omitted, and Ryde's scale of charges for the compulsory acquisition of property is introduced. The amounts of the charges are not materially altered, but the particulars are rendered more explicit than in the existing document.

1. The usual remuneration for an architect's services except as hereinafter mentioned, is a commission of 5 per cent. on the total cost of works executed [under his directions, except as to approving plans and valuing property of great value. Such total cost is to be valued as though executed by a builder with new materials.] This commission is for the necessary preliminary conferences and sketches, approximate estimate when required (such, for instance, as may be obtained by cubing out the contents), the necessary general and detailed drawings and specifications, one set of tracings and duplicate specification, general superintendence of works, examining and passing the accounts, exclusive of measuring and making out extras and omissions.* The clerk of the works should be appointed by the architect, his salary being paid by the client.

2. This commission does not include [the payment for services rendered in connection with negotiations relating to the site, or in surveying and taking levels, making surveys and plans of buildings to be altered, making arrangements in respect of party-walls and right of light, or for drawings and correspondence with local and other authorities, or consequent on the failure of builders to carry out the works, for services in connection with litigation or arbitration, or in the measurement and valuation of extras and omissions. For such services additional charges proportionate to the trouble involved and time spent are made.]

3. In all works [of less cost than £1,000, and in works requiring designs for furniture and fittings of buildings, or for their decoration with painting and mosaics, sculpture, or stained glass, and other like works, and in cases of alterations and additions to buildings] 5 per cent. is not remunerative, and the architect's charge [is regulated by special circumstances and conditions.]

4. When several distinct buildings [being repetitions of one design] are erected at the same time from a single specification and one set of drawings and under one contract, the [usual] commission [may] be charged on the cost of one such building, and a modified arrangement made in respect of the others; [but the arrangement does not apply to the reduplication of parts in one building undertaking, in which case the full commission is to be charged on the total cost.]

5. If the architect should have drawn out the approved design complete, with plans, elevations, sections, and specification, the charge is 2½ per cent. upon the estimated cost. If he should have procured tenders in accordance with the instructions of his employer, the charge is ½ per cent. in addition. [These charges are exclusive of the charge for taking out quantities. Preliminary sketches and interviews, where the drawings are not further proceeded with, are to be charged for according to circumstances.]

6. The architect is entitled during the progress of the works to payment [by instalments] on account at the rate of 5 per cent. on the amount of the certificates when granted, or alternatively on the signing of the contract [to half the commission on the amount thereof], and the remainder by instalments during their progress.

7. Should the client, having approved the design and after the contract drawings have been prepared, require material alterations to be made, whether before or after the contract has been entered into, an extra charge is made [in proportion to the time occupied in such alterations.]

8. The charge per day depends upon an architect's professional position, the minimum charge being three guineas.

9. The charge for taking a plan of an estate, laying it out, and arranging for building upon it, is regulated by the time, skill, and trouble involved.

[10. For setting out on an estate the position of the proposed road or roads, taking levels, and preparing drawings for roads and sewers, applying for the sanction of local authorities, and supplying all necessary tracings for this purpose, the charge is 2 per cent. on the estimated cost. For subsequently preparing working drawings and specifications of roads and sewers, obtaining tenders, supplying one copy of drawings and specification to the contractor, superintending works, examining and passing accounts (exclusive of measuring and valuing extras and omissions), the charge is 4 per cent. on the cost of the works executed, in addition to the 2 per cent. previously mentioned.]

11. For letting the several plots in ordinary cases the charge is a sum not exceeding a whole year's ground rent [but in respect of plots of great value a special arrangement must be made.]

12. For [approving plans submitted by the lessee, and for] inspecting the buildings during their progress, so far as may be necessary to insure the conditions being fulfilled, and certifying for lease, the charge is a percentage not exceeding [1½*] per cent. up to £5,000, and above that by special arrangement.

13. For valuing freehold, copyhold, or leasehold property the charge is—

On £1,000 ..... 1 per cent.
Thence to £10,000 ..... ½ " "
Above £10,000 ..... [½† " " on residue]

[In valuations for mortgage, if an advance is not made, one-third of the above scale. The minimum fee is three guineas.]

[14. For valuing and negotiating the settlement of claims under the Lands Clauses Consolidation Act or other Acts for the compulsory acquisition of property, the charge is on Ryde's scale, as follows:—

ON AMOUNT OF SETTLEMENT, WHETHER BY VERDICT, AWARD, OR OTHERWISE.

Amount.	Gs.	Amount.	Gs.	Amount.	Gs.	Amount.	Gs.
£		£		£		£	
100	5	2,400	25	5,400	40	8,400	55
200	7	2,600	26	5,600	41	8,600	56
300	9	2,800	28	5,800	42	8,800	57
400	11	3,000	27	6,000	43	9,000	58
500	13	3,200	29	6,200	44	9,200	59
600	14	3,400	30	6,400	45	9,400	60
700	15	3,600	31	6,600	46	9,600	61
800	16	3,800	32	6,800	47	9,800	62
900	17	4,000	33	7,000	48	10,000	63
1,000	18	4,200	34	7,200	49	11,000	68
1,200	19	4,400	35	7,400	50	12,000	73
1,400	20	4,600	36	7,600	51	14,000	83
1,600	21	4,800	37	7,800	52	16,000	93
1,800	22	5,000	38	8,000	53	18,000	103
2,000	23	5,200	39	8,200	54	20,000	113
2,200	24						

Beyond this half a guinea per cent.

The above scale is exclusive of attendances on juries or umpires, or at arbitrations, and also of expenses and preparation of plans.]

15. For estimating dilapidations [and furnishing or checking a schedule of same], the charge is 5 per cent. on the estimate, but in no case less than two guineas. [For services in connection with settlement of claim by arbitration or otherwise, extra charges are made, under Clause 8.]

[16. For inspecting, reporting, and advising on the sanitary condition of premises, the charge must depend on the nature and extent of the necessary services rendered.]

17. In all cases travelling and other out-of-pocket expenses are paid by the client in addition to the fees. [If the work is at such a distance as to lead to an exceptional expenditure of time in travelling, an additional charge is made under Clause 8.]

18. When an architect [takes out and] supplies to builders quantities on which to form estimates for executing his designs, he should do so with the concurrence of his client, and it is desirable that the architect should be paid by him rather than the builder, the cost of such quantities not being included in the commission of 5 per cent.

The suggested alterations were discussed in detail, and the debate was eventually adjourned to a special business meeting to be held on Monday, the 27th inst.

Preaching at the temporary church of St. Ambrose, Pershore-road, Edgbaston, Canon Strange announced on Sunday night that the Misses Stokes, who have already given £2,000 to the building fund, have decided to bear the whole of the structural cost of the new church over and above the sum which has been raised in the parish. The church will thus be a building complete, so far as structure goes, not merely with chancel and nave, aisles and transepts, but with tower and spire and tubular bells, besides the organ and east window, already given by these ladies.

* Signifies re-election. New members' names printed in italics.

* This sentence is incorporated in paragraph 11 of the existing schedule.

* In existing schedule ½ per cent.

† In existing schedule, by special arrangement.

CHAMBER OF COMMERCE BUILDINGS, CLEVELAND, OHIO.

AMONG the many clever buildings erected during the past twenty years in America, few have surpassed in merit those designed by Messrs. Peabody and Stearns, the well-known architects, of Boston. To-day we give a view of one of their more recent city buildings—the Chamber of Commerce, Cleveland. The difficulty of investing a vast façade like this with distinguishing character is a very real one when floor upon floor, each of about the same height, has to be provided for. The fenestration necessarily has to follow very nearly the same lines as the apartments within, and the variety of treatment which follows upon a diversity of internal arrangement is wanting in such edifices as hotels and apartment houses or office buildings. The architects in the instance now illustrated have very ingeniously overcome the inevitable monotony so frequently observable in elevations where the conditions of several floors are similar, and Messrs. Peabody and Stearns have inspired their façades with breadth and dignity by pleasingly contrasting the strongly-marked horizontal lines of the base with the vertical lines of the main portion of the fronts. These, again, are crowned by a boldly-managed cornice. The loggia of the top story, it is true, was rendered possible by the increased height of that floor, and thereby great advantage, of course, is obtained, an advantage which would have been lost had the upper part of the building been devoted to small apartments. The sculpture fronting the mezzanine floor is a distinct acquisition, and although there may be nothing, after all, very specially original in the detail of this building, its design is at once modern and architectural in style, its effect being obtained without following any exact period or recognised historical mode. Its parts are somewhat elaborate, notwithstanding the simplicity of its general outlines, and we intend to illustrate a sheet of of its details because of their merit, which we have thus endeavoured to indicate. The *American Architect*, to whom we are indebted for this view, has on more than one occasion enabled us to become acquainted with works by the same architects.

OBITUARY.

THE death is announced of an old and respected townsman of Wolverhampton, Mr. JAMES READ VEALL, architect, which occurred on the 27th May at Beewood. Coming originally from the Eastern Counties, he entered, in the early forties, the office of the late Mr. Edward Banks, of Wolverhampton, and in 1851 established himself in business with Mr. T. R. Meyrick, whose early death severed what appeared to be a promising connection. Some of the principal of his early works were the old town hall, Mr. Henry Underhill's residence at Pirton; Mr. F. Walton's, St. Cuthbert's, Albrighton; Mr. C. Clarke's, Muchall, Penn; and Mr. G. Perry's houses at Stockwell End. His later works comprise the gas company's offices, Darlington-street; Messrs. E. Webb and Son's offices and warehouses, Wordsley; almshouses, Leicester; the Victoria Nursing Institute, Wolverhampton, also sundry voluntary schools, including those in Steelhouse-lane. He also carried out extensive works for the Wolverhampton and the Cannock Boards of Guardians. The agricultural hall was another of his works. The roof of that building was at the time unique in its way, and has since been adopted elsewhere. Amongst the deceased's other works were residences at Codsall, Albrighton, Lapley, Penkridge, together with a few vicarages, mission churches, &c. During the last few years he was one of the surveyors for the diocese of Lichfield in the Archdeaconry of Stafford. He was a man of extensive reading and varied attainments, of sound judgment, and his taste for archæology led him to publish in 1880 a book illustrative of old houses in Wolverhampton and neighbourhood. The deafness from which he suffered precluded him from taking an active part in public affairs. His business will be carried on by his second son, Ashton Veall, whom he took into partnership a few years ago. He leaves a daughter and four sons.

THE German painter, Professor FRIEDRICH GESELSCHAP, whose body was found on Friday near Rome hanging from a tree, had been suffering for some time from depression caused by an injury to his knee, in consequence of which the doctors advised amputation of the leg. Professor Geselchap, who was born in 1835, in Wesel, and studied at the Dresden and Düsseldorf Academies, was best known as a fresco painter who imitated the Classical style. Some of his pictures adorn the walls of the Arsenal in Berlin; but his manner has long been regarded as antiquated and artificial. He had lately been greatly depressed owing to his physical inability to carry out a commission which he had received for fresco paintings on the ceiling of the Friedenskirche in Potsdam.

COMPETITIONS.

SUNDIAL MODELS.—The first prize in the competition for models for a sundial, instituted by Mr. Thomas H. Kelly, of New York, and carried on under the auspices of the National Sculpture Society, has been awarded to Mr. Charles A. Lopez, of New York; the second prize to Mr. W. C. Maynard, of Brooklyn; a first mention to a design whose author is not known; a second mention to Mr. Hall Winters Morris, of New York; a third mention to Miss Janet Hall Scudder, of New York, and a fourth mention to Mr. J. M. Kimball, of Brooklyn. The competition was for a sundial, standing on a pedestal in open ground; and Mr. Kelly offered 500dols. as the first prize, and 250dols. as the second. Twenty-eight designs were submitted, among them being some from England.

WINCHESTER.—The city corporation, at their meeting on Thursday in last week, considered the report of Mr. Jones, the assessor on the designs for public baths, who had awarded the premiums voted by the council as under:—"Cleanliness," first premium, £25; "Aqua No. 1," £15; and the third place to "Comme il Faut." The names of the premiated competitors were respectively Messrs. Lonsdale and Harrison, Compton-terrace, Highbury; Messrs. Hall, Cooper, and Davis, Scarborough, and 21, Old Queen-street, Westminster; and Mr. H. A. Cheers, Twickenham, London. The first premiated plan would, in its complete form, involve an outlay of £10,329; with modifications, either £8,691 or £7,181. "Aqua" was pretty nearly the same, and "Comme il Faut" £6,000 for the whole—two swimming and a Turkish bath, and "slippers." The first plan was adopted by the council, but subject to modifications to reduce the entire outlay to £7,000. The matter was referred again to the Committee on baths, who will communicate with the architects, and report again to the council. The premiums were ordered to be paid, and all plans save the adopted one returned. A curious item arose in connection with the plans—viz., that by some means the contents of one of the bath documents had become known, and it was recommended prompt action should be taken to insure greater secrecy. The town clerk said no person in his office had communicated with the public on the matter, and he should take extra precautions in future with all private documents.

CHIPS.

At the Mart, Tokenhouse-yard, E.C., on Tuesday, Wray Castle, situated on the banks of Lake Windermere, was sold for £25,000. The estate covers an area of about 830 acres.

The Earl of Jersey, Colonel Boughey, R.E., and H. A. Steward, sitting as commissioners under the Light Railways Act, opened an inquiry at Hastings on Tuesday into the application of Mr. Murphy for sanction to a proposed tramway scheme for the borough. A strong opposition was offered by a committee representing many tradesmen, property owners, and influential residents, and the trustees of the Eversfield Estate, the London, Brighton, and South-Coast Railway Company, and the Office of Woods and Forests also opposed the application.

A well-written article, "A Morning on the Island of St. Helena," from the pen of Mr. Harry Hems, appears in Tuesday's issue of the *Western Daily Mercury*.

The proceedings of the meeting of the Association of Municipal and County Engineers in the Nidd Valley, near Pately Bridge, Yorkshire, on Saturday, were marred by the sudden death of Mr. William Tulley, surveyor, of Rothwell, near Leeds. The meeting was especially held for the purpose of visiting the works which the Bradford Corporation have in progress in the Nidd Valley for the supply of water to Bradford, and was attended by municipal engineers from all parts of the country. Whilst in a contractor's train along a light railway on the higher slopes of the valley, Mr. Tulley fell off the truck on which he was riding, and was picked up dead.

PROFESSIONAL AND TRADE SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—On Saturday the members of this association, to the number of between 40 and 50, accompanied by the president, Mr. Thomas Ross, and the secretary, Mr. Hunter Crawford, enjoyed their annual excursion, the place visited being Alloa. Leaving the Waverley Station at 9.10 a.m. the town of yarn was reached shortly after 10 o'clock. The excursionists at once proceeded to inspect the public baths and gymnasium, the gift to his native town of Mr. John Thomson Paton. Mr. John Burnett, A.R.S.A., Glasgow, the architect of the building, acted as guide to the party, and explained all necessary details. Here the Provost said a few words of welcome to the visitors, which were acknowledged by Mr. Ross. Alloa Park and mansion were next visited, and through the kindness of the Earl of Mar and Kellie, the excursionists were conducted over Alloa House and the beautifully laid out garden and grounds. His lordship personally undertook this duty, and afterwards entertained the company to lunch in old Alloa Tower. In the afternoon visits were paid to two of the most recent additions to the gentleman's seats of the district—viz., Greenfield House, the residence of ex-Provost Thomson, and Inglewood, the residence of Mr. Forrester Paton (the architect of both), Mr. Sydney Mitchell, Edinburgh, giving explanations. The company also visited the town-hall and public library, and Alloa parish church. Mr. Forrester Paton entertained the excursionists to tea in the Museum Hall.

THE EDINBURGH ARCHITECTURAL SOCIETY.—At the last meeting of this society, a lecture, entitled "Grammar of House Planning," was delivered by Mr. J. J. Henderson, representative of the Dundee Institute of Architecture, Science, and Art. Mr. William N. Cumming, A.R.I.B.A., the President, occupied the chair. Mr. Henderson treated his subject from a practical point of view, dealing first with general principles, site, prospect with a view to health, nature of soil, drainage, &c. The lecturer drew particular attention to the necessity of frequently consulting the client as to his requirements during the progress of the design. He gave some very interesting notes on constructional details of much value to architects in planning houses. He then passed on to point out the value of ventilation, recommending that all windows should be kept as near the ceiling of rooms as possible.

In the House of Commons, on Tuesday, Mr. Lough asked leave to bring in a Bill to amend the Metropolis Management Acts, and it was read a first time.

Mr. Saudford Fawcett, Local Government inspector, held an inquiry, on Friday, regarding an application by the Northwich Urban Council for sanction to borrow £2,000 to put eight private streets into such a condition that they can be taken over as public thoroughfares. Several of the roads have been like quagmires for years. Nearly £2,000 have been expended on similar work. Notices for ten other streets have been given. There was no opposition.

Mr. James Smith, J.P., timber merchant, of Balliol House, Balliol-road, Bootle, died suddenly on Monday. The deceased, after transacting some business at home, suddenly expired. Mr. Smith was 58 years of age, and at one time was a member of the Bootle Town Council.

Earl Brownlow presided, on Friday, over a Lincolnshire county meeting, held at the Guildhall, Lincoln, for the purpose of promoting a subscription for a Lincolnshire memorial of the late Lord Tennyson. On the motion of the Bishop of Lincoln, seconded by the mayor of that city, it was resolved that the memorial should take the form of a statue, to be erected on the best site obtainable in Lincoln.

A committee was formed last autumn to commemorate in some permanent form the completion of his twenty-fifth year of office by the present head master of Bromsgrove School, Mr. Herbert Millington. It was resolved to raise by subscription £1,250, and to expend this sum on a "Millington Laboratory," comprising physical and chemical laboratories, and carpenters' and metal-workers' shops. The architect selected was Mr. Lewis Sheppard, of Worcester, the builders Messrs. J. and A. Brazier, of Bromsgrove, who designed and built "Lyttelton House" for the school in 1893. This building, which is in the English Renaissance style, will be opened on Wednesday, July 27, by the Bishop of Worcester. A boarding-house is also being erected on a site contiguous to the school playground, and will be opened in May next year.

Building Intelligence.

BANGOR, CO. DOWN.—The foundation-stone of Hamilton Road Presbyterian Church was laid last week. The plan of the church is horseshoe shape. The section now in course of erection will accommodate about 400 on the ground floor, and about 300 in the galleries, and the next section, in the form of a second transept, will give accommodation for about 300, so that the church will ultimately seat a congregation of 1,000. The front vestibule has inner lobbies, right and left, to the aisles of the church, and off these doors to gentlemen's and ladies' cloakrooms. As no schools or lecture-halls are proposed for the present, the plans have been prepared so that the second section can be erected immediately, and utilised in the meantime as lecture-hall, committee-room, vestry, and schoolroom, a screen wall dividing the two blocks. This screen wall can be taken down at any time and the whole thrown into the church, and the lecture-hall and schoolroom erected in an attached building, for which there has been ground secured. The galleries will be carried on steel cantilever girders, and the roof trusses will also be of steel. The interior woodwork will be of pitch-pine, and the walls of the building in local stone, with Scrabo stone for dressings. A corner tower has been provided, to which it is possible to add a stone spire in the future. The building has been designed in the Perpendicular period. The architect is Mr. Wm. J. W. Roome, M.S.A., Belfast. The contract is in the hands of Mr. James Colville, builder, Bangor, and the clerk of works is Mr. Bailey.

EDINBURGH.—In 1885 Mrs. Traquair decorated with symbolical pictures the small mortuary of the old Sick Children's Hospital, Lauriston-lane, Edinburgh. When the hospital was removed to another site, and it became necessary to pull down the old building to make way for the new infirmary ward, an attempt was made to cut them out of the walls with a large measure of success, some of the best of the old decorations being now incorporated in the walls of the mortuary of the new hospital, Sciennes-road. These include a panel, called "Maternity"; another symbolical design of the Cup of Life, with mortals drinking from it; and a larger group representing the Bridge of Life. Mrs. Traquair has decided, as a labour of love, to complete the decoration of the present walls. Having for central panel the "Maternity" group, Mrs. Traquair has worked it into a design, the upper parts of which are filled with child angels, in various stages of spiritual development. On the east and west walls there are six large red-winged figures, representing the angels of creation. They stand on spheres, which suggest the separate acts of creative power. Behind the seraphs the walls are divided into six horizontal zones, representing terrestrial and celestial objects. The large panel of the Bridge of Life, with its angel figures, nearly filled the south wall. All that was necessary to complete the decoration of this part of the chapel was a broad arabesque border, in which symbols of Time and Eternity have been interwoven. The roof has been treated in cerulean blue, with gold circle ornament. The dominant notes in the decorative scheme are gold and blue and green and grey.

INVERNESS. — The Tweedmouth Memorial Chapel, erected by the Dowager Lady Tweedmouth in the grounds of the Northern Infirmary, was opened on Saturday. Built of dressed freestone, the chapel is designed in a Late Pointed phase of Scotch Gothic. It is cruciform in design, with a steep-pitched roof covered with grey slates, and is surmounted in the centre by a fleche of oak, and slated, rising to 50ft. above the ground. The south window has three lights and tracery, and the windows in the two transept gables are triple lancets; while a rose window, about 10ft. in diameter, gives light from the north end. The nave is 44ft. by 18ft., whilst in either side there is a transept, separated from the main area by wrought-iron gates and curtains, for use by worshippers of the Roman and Anglican communions. The whole of the furnishings are in oak. The inside walls are of polished freestone, and the windows are all deeply moulded, the jambs and mullions being finished with shafts of grey Kilkenny marble and carved capitals. The roof is also in oak, panelled, and the arched ribs rising from the carved couples divide the interior into three bays. The floor of the chapel is laid with oak parquetry, stained and polished. A corridor, 6ft. wide, connects the church with the infirmary. Messrs. Ross and Macbeth, Inverness, were the architects.

CHIPS.

Colonel J. T. Marsh, R.E., of the Local Government Board, held a public inquiry, on Thursday in last week, relative to the application of the urban district council for sanction to borrow £2,000 for the purpose of lighting the promenade by electricity.

In connection with the Phœnix Lodge, 904, of Freemasons, the dedication ceremony took place on Friday of new Masonic buildings which have been erected in High-street, Rotherham, by Bro. Henry P. Gough, a townsman.

An addition to the series of the stained-glass windows in St. Cuthbert's Parish Church, Edinburgh, was unveiled on Sunday. It has been placed under the gallery in the south transept. The subject is a figure of Christ breaking bread, as suggestive of the Communion. The subject is inclosed in a framework of architectural ornament. The details harmonise with the other windows in the church.

The new stables and other buildings just erected in Graeme-street, Glasgow, for the Cleansing Department of that city were opened on May 31. They have been built at a cost of £14,000, from plans by Mr. Wheatley.

The Newport-Pagnell Urban District Council have accepted the tender of Messrs. G. Waller and Sons, of Stroud, for the new engines and pumps, designed by Messrs. D. Balfour and Son, of London and Newcastle, required at the town waterworks, which, owing to their increased power, will enable the supply to be delivered in six hours.

The scheme of water supply submitted by the Easington Rural District Council for Castle Eden Colliery has been approved by the Local Government Board. The water is pumped at Wingate from the sand-feeder up into the reservoir, and then is to be conveyed a distance of three miles in cast-iron main, when it will be distributed over the town. The scheme has been designed by Messrs. D. Balfour and Son, of London and Newcastle.

Alterations are being made to Messrs. Coomb's Brewery, Radstock, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

Mr. S. Fawcett, inspector of the Local Government Board, held an inquiry at Wilmslow on Friday with reference to the application of the district council for sanction to borrow £1,100 for main road and private street improvements.

The competition for the Legislative Palace of the City of Mexico has been decided by the award of the first prize, of 15,000dol., to Mr. Adamo Boari, an Italian architect, for some years resident in Chicago. The second prize has been awarded to another Chicago architect; but his name is not yet announced. The building is to cost five million dollars.

Colonel W. R. Slacke, M.E., Local Government Board inspector, held an inquiry at Shifnal, on Tuesday, as to the application of the district council for sanction to borrow £3,300 for purposes of sewage and sewage disposal, and £3,745 for purposes of water-supply for one special district of their area.

The Light Railway Commissions held an inquiry at Chatham, on Thursday, Friday, and Monday, into an application made by the Chatham, Gillingham, and District Electric Railways Company for powers authorising them to construct a series of light railways, or tramways, between Chatham and New Brompton, and between the former borough and certain populous suburbs. The proposal is to establish electric street tramways on the overhead trolley wire principle, and the promoters have undertaken to contribute about £10,000 towards the widenings required at various points. The local authorities of both towns supported the application, but had stipulated that they should have the option of purchasing the undertaking at the expiration of 42 years. The Earl of Jersey said the Commissioners were prepared to recommend that the order be granted.

Mr. J. T. Marsh, C.E., of the Local Government Board, held an inquiry at Llandudno, on Friday, as to the application of the urban district council for a loan of £16,000, the estimated cost of erecting new municipal buildings on land in Lloyd-street, valued at £4,500, and given to the town by Lord Mostyn. The clerk said the scheme had been under consideration four years, and that the plans of Mr. Silcock, of Bath, were accepted as the result of a competition. The present offices were utterly inadequate for the purposes of the council. Lord Mostyn's agent, Mr. Pickering, had written in terms of disapproval of the plans of the new buildings as not being of a sufficiently imposing appearance, and stating that the architect had evidently been limited in the matter of funds.

Engineering Notes.

NOTTINGHAM.—In connection with the development of the Clifton Estate on the north side of the Trent at Nottingham, the first pile has been driven of the Trent Bridge Embankment, by which a new roadway will be provided. The road will be 1¼ miles in length, extending from Trent Bridge to Wilford Bridge, and will consist of a carriage-way 36ft. wide, with two footpaths on each side, separated by grass verges, upon which trees will be planted. The footpath nearest the foreshore of the river will be 15ft. wide, and the total span of the road, including footpaths and grass verges, will be about 90ft. From the south edge of the 15ft. footway, running down to the river, a grass foreshore will be laid of easy slope, terminating in seven concrete steps extending the whole length, at the foot of which will be driven a wooden piling. On this foreshore will be planted several rows of trees, and the area will be open for the recreation of children. The road will follow the windings of the river, and will be formed at a sufficient height to be above flood level, so as to be available for use in all states of the river. A large amount of the material required to elevate the road to the requisite height will be dredged from the Trent. The chief contract has been let to Mr. A. Kellett, of Manchester, and the kerbing, channelling, asphalting, and the making of the road will be executed by the Nottingham Town Council staff. The works have been designed by, and are being carried out under the direction of, the Nottingham city engineer, Mr. A. Brown.

The annual meeting of the Royal Architectural Museum, Great Tufton-street, Westminster, will be held this (Friday) afternoon at four p.m., under the presidency of the Duke of Westminster, when the art studios, just added to the buildings from the designs of Messrs. Lee and Pain, will be thrown open for inspection. All architects are cordially invited to attend.

Mr. W. H. Clary, assistant borough surveyor of Derby, has been elected borough surveyor for Sutton Coldfield, vice Mr. C F. Marston, resigned. Mr. Clary's salary will be £300 a year, and he will have to devote his whole time to the services of the corporation.

During 1897 a Leeds firm purchased for the sum of £30,000 the large tract of land at Scarborough, known as the Woodhall Estate, on the north side of the town. The new owners have already commenced operations in connection with the erection here of some 1,200 new houses, at rents varying from £12 to £15 a year.

Arrangements are in progress for the annual convention of the National Master Plumbers' Association which is to take place in Quebec the latter part of this month. The president is Mr. Joseph Wright, of Toronto.

The Venerable Melville Horne Scott, Archdeacon of Stafford, and Canon of Lichfield Cathedral, died on Friday. The deceased, who was born at Gawcott, Buckinghamshire, in 1827, was a son of the Rev. Thomas Scott, M.A., incumbent of that parish, was a direct descendant of Thomas Scott, the great commentator, and a younger brother of the late Sir Gilbert Scott, R.A.

At a meeting of the Society of Biblical Archæology, held on Tuesday evening, at Great Russell-street, London, Sir H. H. Howorth, K.C.I.E., read a paper on ancient picture writing.

At Cobholm, Great Yarmouth, the foundation-stone has been laid of a new church about to be erected from plans by Mr. Sidney Rivett.

Mr. Charles White, a well-known Liverpool engineer, died at his residence in Alexandra-road on Friday at the age of 71 years. Born in Yorkshire, he had to do with some of the first railways constructed in this country by George Stephenson. About 30 years ago he undertook the offices of chief engineer and estate manager to the Leeds and Liverpool Canal Company, but through ill-health was compelled last Christmas to relinquish the former position, which was taken by his son, Mr. Robert H. White.

The new athletic ground at Tonbridge Wells has been opened by the Marquis of Abergavenuy. The ground affords accommodation for 12,000 people, and covers 12½ acres of land, which has been leased to an association at £7 per acre by the Marquis of Abergaveuny. In addition to a cricket pitch, there are a cycling track and a football ground, the whole of the works having been carried out by Mr. W. Roper, of Tunbridge Wells. The construction of the ground has necessitated the removal of 60,000 cubic yards of earth.

TAUNTON TOWN HALL COMPETITION: SELECTED DESIGN.

MESSRS. SAMSON AND COTTAM, architects, Taunton, are the authors of this design, which has been chosen for execution, and they were awarded the first premium of £100. The second prize of £50 was given to Mr. J. M. Brydon, F.R.I.B.A., of London, for the set marked "N," and the third of £30, was taken by Mr. H. T. Hare, of London, for the set marked "L." The other competitors were as under:—Set B, Messrs. Tapper and Crouch, London; set C, Messrs. Silcock and Reay, Bath; set D, Mr. R. Knill Freeman, Bolton; set E, Messrs. Gibson and Russell, London; set F, Messrs. Mallows and Grocock, of Bedford; set H, Mr. W. H. Crease, of Bristol; set I, Mr. G. Elkington, London; set J, Messrs. Murray and Foster, London; set K, Mr. C. Henman, London. The following description, drafted from particulars, has been sent us by the authors of the selected design. The building is in the Renaissance style, and possesses many notable features. When erected on the Parade it will form a distinct ornament to the town, and will at the same time provide the convenient rooms and offices which are so necessary to the municipality. A remarkable and novel feature is a triforium on each side of the hall. The arrangements adopted in the design can best be gathered by a consideration of the plans of the several floors. It may be pointed out that on the ground floor the market is placed in the centre of the north front, facing the Parade, and that the main entrance to the town-hall and the guildhall is placed to the east, while the offices, &c., of the trustees' present tenant are situate to the west of it. The arrangement of the east and west wings is so nearly symmetrical and equal in size, that it would be quite feasible, if thought desirable, without materially altering the principle on which the design is planned, to transpose them and to place the principal entrance and guildhall on the west of the block, so that they would come opposite the approach from Corporation-street, as well as High-street, North-street, &c. This may be thought more desirable, as the street is much wider here than on the east side. This, however, is merely a matter of arrangement and convenience of plan best adopted to meet the views and requirements of all parties, which can be adopted without departing from the spirit of the design. Great care has been bestowed on the proper planning of approaches and exits, which, it is believed, will be found convenient and safe. It is suggested that the two subsidiary staircases as a general rule should be used for exits only, though it might on certain occasions be useful to employ them for purposes of entrance, either as early doors or approaches to reserved or cheap sides. Ticket offices and a men's and women's lavatory have therefore been shown in connection with them. Space has been left for the shops facing south, as directed. It is submitted that it might be advisable to omit one shop, and form a convenient approach to the market from the south in place of it. No lavatory accommodation has been provided in connection with the market and shops; should such provision be thought desirable, it is considered that it would practically amount to providing public lavatories, which would not only be beyond the scope of the scheme, but for which a better site could probably be found elsewhere in close proximity to, but not necessarily in connection with, the new buildings. A sentence may, perhaps, be devoted to indicating the method of construction which it is proposed to adopt in the roof and to carry the clock-turret. There will be two strong longitudinal steel lattice girders forming trussed purlins, which will do the duty of the transverse tie-beam trusses usually employed. These permit of the formation of a coved ceiling to the hall, and leave on either side a sort of triforium, or gangway, already referred to, which will have several important uses as it will give access to the clock-chamber and ventilating turret, also to the gutters and over the whole space between ceiling and roof for access to electric lighting or other wires. It will further permit of opening, closing, &c., the dormer windows without the employment of unsightly and unworkable cords or gearing, and consequently of the regulation of ventilation without disturbing the audience or diminishing the air space of the hall, and will to a great degree dispense with the use of ladders in decorating the hall. Strong steel cross-ribs will be introduced as required to complete the roof construction. The sum at disposal is not sufficiently large to permit of any great outlay upon the several façades of the new building. These have, therefore, been kept plain, and reliance for effect is placed upon the disposition of the several parts and a broad treatment of the whole mass. In view of the great distance from which the building, especially the north or principal front, can be seen, it is considered this will be found more truly artistic and effective than a treatment of the front in small parts and the elaboration of minute details. With regard to the materials to be employed, it is proposed that the front be constructed of red bricks in thin courses with Hamhill stone or terracotta dressing. The roof will be slated. The internal walls and ceilings generally will be plastered, and the cornices and decorations are to be of wood, the whole of the staircases of fireproof construction in concrete. The stage, orchestra, and accessories generally are those usually provided in modern buildings of this description. Having regard to the various uses to which the hall is likely to be put, it is suggested that the sides and ceiling of the stage should be constructed of light framework made easily removable, giving ample space for wings and flies when the hall is to be used for theatrical performances. The question of heating and ventilation has been most carefully considered in preparing the scheme, though nothing is allowed for the former in the estimate appended. It is proposed to heat the new building by means of hot-water circulating pipes on the high pressure system, the heat being distributed by means of radiating coils fixed in suitable recesses beneath the windows or elsewhere as may be desirable. The ventilation will be induced by the introduction of warm air over these coils and by the extraction of the foul air at the ceiling level of the hall and guildhall and elsewhere, from which it will be taken out in shafts around smoke-flues and also through the formers, and the flèche containing the clock as before described. It is submitted that the arrangements thus indicated will provide a well-warmed and ventilated building under all ordinary conditions. Mr. Edward W. Mountford, F.R.I.B.A., acted as professional referee, and his award was unanimously adopted. We hope shortly to illustrate the two other premiated designs.

WROUGHT-IRON GATES, NEWNHAM PADDOX, LEICESTERSHIRE.

JUST NOW, while the Art Metal-Work Exhibition is open at Westminster, an additional interest is given to any really fine examples of wrought iron. In any case it would be difficult to find a more admirably-designed specimen of smith's work than the pair of gates of which we give a capital detail drawing to-day from the appreciative pencil of Mr. J. J. K. Phillips, to whom a National Bronze Medal was awarded for this very useful sheet. Structurally these gates are well contrived, and artistically the whole composition leaves nothing to be desired. The work is refined with boldly-conceived piers, while an exceedingly handsome skyline is made of the crowning feature surmounting the arched head of the gateway. In most modern productions the dominating outlines are often ill-considered and poor, while too much elaboration is not infrequently introduced into the wickets themselves. In this pair of gates simplicity itself is justly valued at its worth, so that by the advantage of contrast the stationary parts of the structure hold an enhanced importance in respect to scale as well as to richness of decorative effect. Note, for instance, the great value of the plain arched contour of the gates themselves, with their quiet and frequently repeating vertical lines, and when the gates are thrown back the unbroken curve of the soffit, so to speak, of the opening comes into even greater prominence, and looks extremely well. The gates were made towards the close of the last century, and were then erected at Berwick House, Shrewsbury, by the smiths who executed the work at Colebrook Dale. In 1873 they came into the hands of the Denbigh family, and are now standing at Newnham Paddox, Leicestershire.

CHURCH TOWER, MONKS KIRBY, LEICESTERSHIRE.

THE upper portion of this tower was restored by the late George Edmund Street, R.A. The lower parts are Late Decorated. Mr. A. E. Martin received a National Bronze Medal for this drawing as part of a series, all of which were of exceptional merit.

ALL SAINTS, BRIXWORTH.

THIS famous Saxon church, erected in the 7th century, is of national importance on account of its age. Mr. Martin, the author also of this Prize Medal sketch, has added to its value by writing upon the sheet the leading particulars of the history of the building. The plan also accompanies the view.

CHAMBER OF COMMERCE BUILDINGS, CLEVELAND, OHIO.

(FOR description, see p. 813.)

STABLING AND COACHMAN'S COTTAGE, ST. LEONARD'S.

MR. WILLIAM COOPER, of Hastings, is the architect of the block of stables with coachman's cottage, of which a view, with plan, accompanies these few notes. The building has recently been erected for Mr. W. Knighton, LL.D., at "Tileworth," Silverhill, St. Leonard's. Mr. Ashdown, of the same place, was the builder, the contract being completed for £480. The upper part is tile-hung, with roofs of the same material, the walling being in brick. The plan sufficiently exhibits the internal arrangements.

CHIPS.

The death occurred on Tuesday of Mr. Robert Townend Martin, C.E., superintendent of the Liverpool Corporation Waterworks, Rivington. He had been a sufferer from influenza. Deceased, who was about 60 years of age, leaves a widow and daughter. He had been in the service of the corporation about 30 years, and was appointed superintendent some six years ago. He was chairman of the Rivington Parish Council, and did much useful public work.

Messrs. Morrison and Mason, of Glasgow, have secured a contract for the extension of the Birmingham water supply. The contract price is half a million sterling.

The Rivers Committee of the Manchester Corporation have selected three gentlemen to advise them in the matter of sewage disposal—namely, Mr. Baldwin Latham, C.E., Dr. W. H. Perkin, professor of organic chemistry at Owens College, and Dr. Percy Frankland, of Birmingham.

The Birmingham Tame and Rea District Drainage Board have decided that application be made to the Public Works Loan Commissioners for a loan of £100,000 under the provisions of the Extension Act of 1897.

These gates were made at Tettenhall Road towards the close of the last Century, and are considered to be the finest of their kind in this Country. They were first erected at Brewerton House, Shrewsbury. Next came into the possession of the Beaufort Family in 1873, when they were removed and placed in their present position at Newnham Paddox, Leicestershire.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

"BUILDING NEWS" DESIGNING CLUB.

NINTH LIST OF SUBJECTS.

J.—A Small Model Farm suitable for a gentleman's country residential estate of moderate proportions. The site is practically level, and the front faces the S.E. There must be a stable for four cart-horses, one box for a hack, and one for a pony; a stall-shed for six cows, and a calf-house for two, with a sick stall besides; a granary and a mixing floor; a covered yard; a set of four piggeries; a boiling-house and meal store; a cart-shed; one closed coach-house, and a harness place. An implement shed is necessary, and a dung pit. The covered yard must be light and airy, without being draughty. A little feature may be made of a clock turret, and provision must be made for a big water tank. Picturesqueness is not to be overlooked; but the design is to be simple and suitable, in keeping with farm surroundings. Plan 16ft. to the inch, elevations and sections ⅛in. to the foot. View desirable. Economy is essential.

DRAWINGS RECEIVED.—"Oak," "Centaur," "Excelsior," "Jeddah," "Gib."

Intercommunication.

QUESTIONS.

[11962.]—**Royal Engineers.**—What foundation is there for the paragraph which has been the round of the Press to the effect that the Royal Engineers would invariably be employed in connection with military works on frontier? General Maitland, R.E., lately returned from an official tour in India in connection with the employment of R.E. officers there, and it was understood he would shortly issue a report in the matter, and that it would be influenced from a military point of view in connection with the late Frontier War. Some four years ago a committee sat in India under the presidentship of Mr. Lyall, in connection with employment of R.E. officers; but on application to Messrs. Eyre and Spottiswoode I cannot find that reports of results have been issued in either case.—ENQUIRER.

[11963.]—**Drawing.**—1. Will some reader kindly tell me whether good blue-black writing-ink does in place of Indian ink for process reproduction? 2. How is the dotted shading sometimes seen in pen-and-ink illustrations obtained, and how does the draughtsman denote where he wants it put in?—L. C. M.

[11964.]—**Woodworking Machinery.**—Will any kind reader tell me the best kind of woodworking machinery suitable for shopfitter and showcase maker?—A. G. H. [Querist cannot do better than communicate with Messrs. F. W. Reynolds and Co., Edward-street, Blackfriars, S.E.—ED.]

[11965.]—**Two-Spired Churches.**—For purposes of completing a collection, can any of your readers name any church or cemetery chapel (particularly in Ireland) with a tower or spire at either end, giving at a distance the appearance of two churches adjoined?—ARCHITECT.

REPLIES.

[11961.]—**Parliament Street.**—On turning to "Baedeker," I find that the Treasury Buildings were erected in the reign of George I., 1717-1727, and that Parliament-street was opened for traffic in 1732.—T. P.

STATUES, MEMORIALS, &c.

ST. ALBAN'S.—Lord Aldenham having applied for a faculty for authority to complete the work of restoring the high altar screen at St. Alban's Cathedral, the Registrar of the Diocese held a court on Friday at the cathedral. As long ago as 1884 Lord Aldenham commenced restoring the screen, but in 1890, when a portion of the work had been accomplished, Lord Grimthorpe raised objections to the carrying out of certain of the proposals, and as he possessed a faculty which covered the whole building his objections were upheld. Two faculties were subsequently granted to Lord Aldenham; but he did not complete the restoration, and he now petitions for a faculty empowering him to vary the original design. At the Registrar's Court no opposition to this alteration was made, and Lord Aldenham, who has already spent about £10,000 on the screen, will in all probability receive the desired faculty within the next few days. The work now to be undertaken is the filling-in of the empty obloug space above the Communion-table with a representation of our Lord rising from the Tomb, and the placing upon the plain cross in the centre of the screen a figure of the Crucified Saviour. The work will be executed by Mr. Alfred Gilbert, R.A.

WATER SUPPLY AND SANITARY MATTERS.

METROPOLITAN WATER SUPPLY.—The Royal Commission on this subject resumed its sittings on Monday. Sir A. R. Binnie, engineer to the London County Council, was further examined on the question of the partition among the outside county authorities of those portions of the water undertakings supplying within their districts but outside the County of London. In his view the counties would be well advised to take water in bulk from the proposed new authority and distribute it themselves, as in that way they would be saved any capital expenditure. But the option should be left to the outside authorities between that course and partition. After the witness had been cross-examined on behalf of the water companies, and re-examined on behalf of the London County Council, the meeting adjourned.

CHIPS.

Lord Eustace Cecil, brother of the Prime Minister, has erected, at his sole expense, a beautiful church in the Early English style at Lytchett Minster, Dorset, where he resides. The architect is Mr. Crickmay, of Weymouth. The building has just been dedicated by the Bishop of Salisbury.

An attempt is to be made to secure "light railways" in South London. A Mr. William Murphy is promoting an application to the Light Railway Commissioners for an order authorising a light railway from Herne Hill to Farnborough, via Norwood-road, Camberwell, Lewisham, Beckenham, and Bromley. The Beckenham Urban District Council has decided to take steps to oppose the application, and the Lambeth Vestry has promised the council its support.

Archdeacon Wilson, of Rochdale, on Saturday, laid the chief corner-stone of a new school and mission church, which is being built at Castleton, at a cost of about £3,000. The buildings are Gothic in style, of red brick with stone dressings. Mr. Henry Lord, of Manchester, is the architect, and Messrs. W. A. Peters and Sons, of Rochdale, are the contractors.

The Board of Trade has issued copies of the order made by the Light Railway Commissioners, as modified and confirmed by the board, authorising the construction of a light railway in Rothwell, commencing by a junction with the East and West Yorkshire Union Railways at Robin Hood, and terminating at Royds Green Lower. The railway, which is to be known as the East and West Yorkshire Union Light Railway, is to be constructed on the usual gauge of 4ft. 8½in., and is to be completed by Dec. 14, 1901.

LEGAL INTELLIGENCE.

FRANCIS MORTON AND CO., LTD., IN LIQUIDATION.—The Receiver states that he has entered into a contract (which has received the sanction of the Court of Chancery of Lancashire) for the sale as a going concern of the works of the above company, for the sum of £70,000 (subject to payment thereout of a commission) to a responsible syndicate. The buyers have paid a deposit of £7,000 on account, and the purchase is to be completed and the balance of the purchase money paid on the 15th July next. It is one of the terms of the contract that the business shall be carried on by the Receiver in the mean time, as heretofore; but the purchasers take over all the contracts, liabilities, and engagements entered into by him in connection with the business as from the 30th June. The above-mentioned amount will be sufficient to enable the Receiver to discharge the mortgages, debentures, and other prior charges and the costs of the liquidation, and leave a balance. In addition to this, there are certain assets excluded from the above sale, which will be realised as speedily as possible. In the result it is estimated that there will be sufficient to pay to the unsecured creditors a dividend of about 6s. in the pound.

"NO EXTRAS": A HARD CASE.—HORSCROFT V. DAVIS.—In this case, heard at Kent Assizes last week by Mr. Justice Wright, the plaintiff, Theodore Horscroft, builder, of Maidstone, sought to recover from the defendant, a baker, also of Maidstone, the sum of £81 14s., arising out of extras over a building contract. It appeared that plaintiff agreed to build two houses for defendant in Heathorn-street, Maidstone, for a sum of £410, and a contract was entered into to that effect. Plans of the houses were submitted to the borough surveyor, but when he saw where the houses were to be built, the site being on land which was practically a tilled-up stone quarry, he would not say that the foundations, as marked on the plan submitted, would be deep enough. Plaintiff accordingly saw defendant, and discussed with him the question of foundations. The surveyor told the builder that he must take the foundations to a lower depth than the plans showed. Some conversation took place between plaintiff and defendant, and Horscroft told Davis that he reckoned the extra cost of lower foundations to defendant would be about £80. Defendant said he did not think he could find the money, and plaintiff thereupon said if he made a good thing out of the job he would make an abatement on the bill of extras. When the works were completed plaintiff found he could not make the abatement, and accordingly sent in the bill of extras for £81 14s., the payment of which defendant disputed. Counsel for defendant contended that a clause in the contract that the £410 should include all extras covered the question of the increased depth of the foundations. On the other side it was submitted that the clause referring to extras did not cover the increased cost of the foundations, and it appeared that defendant had agreed in conversation with plaintiff that something was due to him for the extra work, and made an offer of £20. The Judge decided that the claim must fail, although he admitted that it was a great hardship for the plaintiff.

WHAT IS A STREET?—At West London Police-court, on Monday, Mr. Lane, Q.C., heard a summons against Mr. William Henry Gibbs, a builder of West Kensington, for preparing to lay out a street at the Hamlet-gardens Estate, King-street, Hammersmith, without first obtaining the sanction of the London County Council. Residential flats were being erected on the estate, and for the defendant counsel argued that as the street—if it could be so called—was in the nature of a court-yard, and intended exclusively for the use of the tenants, it could not be considered a highway within the meaning of the Act. Mr. Chilvers, for the Council, maintained that whether the street was a private one or not, the provisions of the Act, nevertheless, applied, and he quoted the decisions of learned judges in support of his contention. Mr. Lane confessed that, after reading the decisions, they seemed to be at variance with one another. He found for the defendant, and, in dismissing the summons with five guineas costs, granted Mr. Chilvers a special case for the consideration of the Superior Court, at the same time advising that gentleman to ask the judges to accurately define the meaning of a street.

The town council of Hull have decided to widen Passage-street at an estimated cost of £27,000.

The dedication of a stained-glass window which has been erected in the church of All Saints, Boothen, as a memorial of the late Mr. Richard Pilsbury, took place on Saturday afternoon. Mr. Pilsbury was a native of Burslem, and was apprenticed to the trade of a china painter with Messrs. Alcock, of the Hill Pottery. He afterwards became connected with Messrs. Brown-Westhead and Moore, and Mintons, Limited, and at the time of his death he was art decorator at Messrs. Moore Bros., of Longton.

PARLIAMENTARY NOTES.

WORKING MEN'S DWELLINGS BILL.—The second reading of this measure was moved on Wednesday by Sir Howard Vincent, who explained that its object was to empower local authorities to advance, under suitable conditions, sums of money in order to enable working men to become the possessors of their own dwellings. Not more than three-fourths of the required sum could be advanced, the working man himself paying in cash the remaining fourth, and the Bill fully safeguarded the interests of the public and those of the ratepayers. The definition of "working man" given in the Bill included clerks, warehousemen, and shop assistants, but there was an absolute condition that the total income of any recipient of an advance should not exceed £150 a year. Sir A. Hickman, who seconded the motion, observed that the measure was entirely permissive, and it was hedged round with restrictions which would be sufficient to prevent any possible abuse. The house must be intended for the residence of the man who got the advance. It must be in a sanitary condition, and the working man must himself supply one quarter of the purchase-money, while not more than £150 was to be advanced on any one house. Then there was to be no overcrowding, and the site was to be the man's own. If the Bill passed, without cost to anyone, a working man would be able to borrow at about 3½ per cent., and an advance of £150 would only cost him about 1s. 11d. a week. The great tendency of the Bill would be to encourage thrift, and to prevent overcrowding. Mr. McKenna opposed the motion, as he considered that the principle of the Bill was financially unsound. He moved an amendment, declaring that in any measure for facilitating the acquisition of dwellings for the working classes by the use of public money, the freehold ought to be vested in public bodies, and not in the individual. Mr. John Burns seconded the amendment. Sir A. Rollit and Mr. Gray supported the Bill, which was opposed by Mr. J. Samuel. Mr. T. W. Russell, on behalf of the Government, supported the motion for the second reading. The view of the Government was that the principle of the measure was good, and that after the second reading had been passed the Bill ought to go to a Select Committee. After a long discussion, the closure was carried by 174 to 88, and, on another division being taken, the amendment was negatived by 181 to 82. The Bill was then read a second time. Sir Howard Vincent then moved that the Bill should be referred to a Select Committee, but, as objection was taken, the debate stood adjourned.

CHIPS.

The Hon. W. F. D. Smith, M.P., laid at Hendon, on Wednesday, the foundation-stone of a new infirmary which is about to be erected there by the Central London Sick Asylums District Board. The site is on the brow of a hill, and the estimated cost of the new buildings is £95,510, or, with the addition of £12,428 for the site, a total of £107,938. The infirmary will, when completed, provide accommodation for 274 patients, and the site allows ample room for any extension that may become necessary.

The Lord Mayor of Birmingham laid, on Wednesday, the foundation-stone of a new wing of the Midland Counties Hospital for Incurables at Leamington, to be erected in commemoration of the Diamond Jubilee. The extension is part of a scheme involving an outlay of £17,000.

The Church Sunday-schools at Saltash, which have been rebuilt at a cost of £800 from plans by Mr. Edmund Sedding, of Plymouth, were reopened on Friday.

Mr. John Morley, M.P. for Montrose Burghs, attended the opening, on Saturday, of a public library presented to Arbroath by Mr. David Corsar, manufacturer and leading citizen. The building, which was formerly used as the high school, occupies a central position in Hill-square. Externally as well as internally it has been radically altered to adapt it to the purposes of a library, reading-room, and picture-gallery; and, what with the addition of a new wing and entrance-porch, the placing of statues in niches on the uppermost story, and the conversion of the old playground into a terraced garden, the building is, for all practical purposes, a new possession for the town. Mr. Gavin was the architect.

The new infirmary, Wallingford, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The committee of the new co-operative headquarters, Leek, have accepted the tender of Mr. Thomas Grace, of Leek, for the new offices, stores, bakeries, shops, assembly and board rooms, &c., designed by Wm. Sugden and Son, F.R.I.B.A., Leek and Hanley. When fitted up and furnished, it is estimated the cost will be about £3,500. "Fair wages" clauses are incorporated by the architects in all these contracts.

Our Office Table.

THE report of the directors of the National Gallery for 1897 states that only four pictures have been purchased during the twelve months out of the Parliamentary grant in aid. They are "Christ Disputing with the Doctors," by Ludovico Mazzolino, of the Ferrarese School; a portrait of Edmund Butts, a son of Sir William Butts, physician to Henry VIII., by John Bettes; a portrait by Romney of Mrs. Mark Currie; and a portrait of Mme. Vigée Le Brun, painted by herself. The bequests and donations include Sir John Millais's "The Yeoman of the Guard," "Rabbiting," by George Morland, "Christ and the Woman of Samaria," by George Richmond, R.A., and a portrait of the late Mr. Russell Gurney, by George F. Watts, R.A. The gallery in Trafalgar-square was visited by 423,421 persons on the free days during the year, showing a daily average attendance on such days (206 in number) of 2,055. In addition to the above number, 32,876 persons visited the gallery on the 26 Sunday afternoons on which it was opened during 1897, showing a daily average attendance of 1,265. On students' days (Thursdays and Fridays) 39,358 persons were admitted. The Gallery of British Art at Millbank has been visited by 104,275 persons on the public days from August 16 to December 31, showing a daily average attendance of 1,337. On the six Sunday afternoons on which it was opened it was visited by 19,955 persons, showing a daily average attendance of 3,326. On students' days 15,795 persons were admitted between August 16 and December 31. The new edition (the 78th) of the historical and descriptive catalogue of pictures belonging to the foreign schools is in the press, and will be ready for issue shortly.

WRITING in the June issue of *A.A. Notes*, Mr. W. H. Jamieson, hon. solicitor to the Architectural Association, expresses the opinion that architects' assistants and clerks of the works are within the Workmen's Compensation Act, because the definition of the term "workman" appears to be very wide and comprehensive. It includes every *person* who is engaged in an employment to which this Act applies, whether by way of manual labour *or otherwise*, and whether his agreement is one of service, or apprenticeship, *or otherwise*, and is expressed or implied, is oral or in writing. In a small publication upon the Act by a barrister, he says, "the definition under the Act makes no distinction between the character of the workmen's labour, and expressly includes apprentices without any limitation. A clerk, commercial traveller, or errand-boy is open to the privileges of the Act equally with the bricklayer, coal-hewer, or engineer, and there seems no reason why the managing director of a company should not also be included." The "employers," or persons acting as "undertakers" of the employment are—says Mr. Jamieson—the parties liable.

WE quoted a fortnight since a description, by Sir J. Charles Robinson, of the five large gun-metal medallions recently found at Kew, and now on view at the Art Metal Exhibition at the Royal Aquarium, by permission of the Queen. Sir J. C. Robinson has now completed his identification of the bronzes, showing in the first place, that they illustrate several distinct events and not a single occurrence, and, in the next, that the date of their production must be put somewhat later than he had at first thought to be the case—viz., shortly after 1687 rather than 1680. The earliest subject in point of date refers, he says, to the quarrel of Louis XIV. with the Pope Alexander VII., on account of the affray at the French Embassy in Rome with the Pope's Corsican guard, and which served as a pretext for the seizure of Avignon (1662); this is the subject for which the erection of a pyramid is seen in the background. No. 2 is the relievo in which are the arms of Sweden on a banner, and in which one of the personages has the Danish Order of the Elephant; this illustrates the overruling by Louis of the Elector of Brandenburg and the King of Denmark, in favour of his ally the King of Sweden, at the Peace of Nimeguen (1679). No. 3 apparently represents the submission of the Republic of Genoa, when the Doge and four of the leading Senators were sent as suppliants to Versailles (1685). Nos. 4 and 5 have reference to the further quarrel with Rome, touching the territorial pretensions of the French Embassy, and are episodes of the same event (1687). Succinct accounts of all these transactions will be found in Voltaire's "Siècle de Louis Quatorze."

AT the meeting held in Lincoln to discuss the question of erecting a statue to the memory of the late Lord Tennyson, Alderman Page quoted words from a letter written to him as Mayor of Lincoln at the time of the opening of the School of Art. Mr. Ruskin wrote: "I have always held, and am prepared against all comers to maintain, that the Cathedral of Lincoln is out-and-out the most precious piece of architecture in the British Islands, and, roughly speaking, worth any two other cathedrals we have got; secondly, that the town of Lincoln is a lovely old English town, and I hope the Mayor and Common Councilmen won't let any of it (not so much as a house corner) be pulled down to build an institution, or a market, or a penitentiary, or a gunpowder and dynamite mill, or a college, or a gaol, or a barracks, or any other modern luxury. And, thirdly, it might possibly make the students of the art classes look up a good many things that they would be the better for knowing if the Town Council were to offer a prize for a design to be painted or frescoed in the Town Hall of the most pathetic and significant scene in all British history—the first real union of Scotland and England, in the funeral procession of Bishop Hugh, when the King of England (John), barefoot, bore the coffin with three archbishops, and the King of Scotland followed weeping."

THE operations at Greyfriars Churchyard, Edinburgh, promise, says the *Scotsman*, to bring about an improvement in the locality. The old wall which bounded the churchyard at Candlemaker-row was so far off the plumb that at any moment it might have toppled over into the street, bringing along with it half a score of monuments, the Martyrs' among the rest. Something of an ornamental character will be given to the new wall, which will be divided by intervening piers into nine sections, rising by a regular succession of steps from the lower to the higher level of Candlemaker-row, and the whole will be surmounted by a 3ft. iron railing. Each pier will be finished with an ornamental cope, and just under the cope will be a cartouche panel for the reception of the name of a distinguished man buried in the churchyard. Mr. Morham, the city architect, who has designed the entire scheme, has asked Mr. J. G. Ferguson, the city recorder, to suggest, from a list furnished to him, the nine names whose memory may in this manner be perpetuated. An arched gateway, giving access to the broad flight of stairs at the bottom of Candlemaker-row, likewise enters into the scheme. The level of the ground will be slightly raised on the inside, one effect of this being that the Martyrs' Monument, which formerly stood on ground considerably below the level of the gravel side-walk, will now be seen, and its inscriptions read, to much greater advantage.

"THE Development of the Tomb in Egypt" was the subject of a lecture given by Professor Flinders Petrie at the Royal Institution on Friday night. The earliest tombs belonged, he showed, to a time when the mummy theory was not in force. The principal age of development was from about 4,000 B.C. to 2,500 B.C., after which date no new ideas were introduced. By numerous lantern-slides the lecturer illustrated the development of the above-ground portion of the tomb from a mere mound, with a niche out of which the soul might come, to a complex structure with numerous chambers and courts. He pointed out how the form and plan were influenced, now by the desire of the family to have the statue representing the deceased in full view, now by their anxiety to have it preserved from any disfigurement by having it entirely walled up, and explained how the sculptures and decorations were for the delectation of the soul. Next he described a series of tombs with sloping brickwork passages leading down to the chamber containing the coffin, and showed how, on account of engineering difficulties, the passage itself became a high vaulted chamber. The earlist pyramid started from such a type. Successive coats of masonry were added above the tombs, so as to leave the outline stepped, and finally it occurred to the builders to put on an external smooth slope. All pyramids, however, were not built in this gradual way, later ones being started *de novo* and carried out in single structures. In later times—about 600 B.C.—the tomb was merely a

well-shaft with a chamber opening off it at the bottom to contain the body, and ultimately it became a simple shallow grave into which the body was put in the clothes worn in life.

The Metropolitan Asylums Board further considered, on Saturday, a letter from the Local Government Board, dated 25th April, stating that the report of the Special Committee referring to the Brook Hospital expenditure "does not contain specific replies to the several questions asked in their letter of the 22nd October, 1897"; that the committee did not employ a competent surveyor as suggested by them, and as ordered by the managers; and that they "are still of opinion that the course suggested by them should be adopted, and will be glad to receive the information asked for in regard to each of the points referred to in their letter." An amendment "that the Local Government Board be asked to institute an inquiry into the gross extravagance of the Hospital Committee" was moved by Mr. Purchase, who said the Brook Hospital had cost £70,000 over the architect's estimate, and £38,000 worth of work had been done by the architect without consulting with the Asylums Board. Not only had the architect acted in the manner described, but, through delays for which he was responsible, the board had had to pay considerably over £2,000. The amendment was withdrawn, and on the motion of the Rev. G. W. Pope, it was agreed to reply to the Local Government Board that the board would render every possible assistance to the Government Department if they would undertake the inquiry themselves.

The proposal to establish a builders' exchange on Tyneside has been successful, and an institution under the style and title of the Newcastle, Gateshead, and District Building Trades Exchange, is being carried on by a limited liability company. The list of subscribers is an influential one, and the executive appears to be representative of all the branches of the building trade. Rooms have been secured at 62, Grainger-street, and on Monday morning last, these were formally opened. Parts of the premises will be set apart as sample rooms, to enable merchants and others to exhibit their goods. The company has been registered with a capital of £10,000 in £1 shares; but it is only proposed to issue 500 shares, as that number will be sufficient in the mean time to provide working capital. Nearly 350 of these shares have already been taken up, and the membership is over eighty.

At the Royal Institution on Saturday Dr. Caton gave the first of two lectures on "The Temples and Ritual of Asklepios at Epidaurus and Athens." The author described and showed by means of numerous lantern-slides the great sanctuary of Asklepios at Epidaurus, both in its present state and as conjecturally restored. The vast extent of the precinct was pointed out, and the beauty of the temples of Asklepios, Artemis, and Aphrodite, together with the pediment groups, acroteria, and other sculptured remains recovered which belong to the best periods of Greek art. The circular edifice known as the Tholos was described, and the difficult question as to its purpose discussed. The ward for the sick was shown in its present ruined state, and also as it probably existed in ancient times. The hostels, gymnasia, propylæa, grove, altars, baths, home for the dying, maternity building, library, and stadium were referred to, and the magnificent theatre—the finest in existence—was described. Dr. Caton afterwards gave an account of the Asklepieion at Athens, a smaller and later institution, consisting of temples, Abaton, sacred well, and grove.

The Société Centrale d'Architecture de Belgique is organising an excursion from August 13th to 21st, to Champagne and Bourgogne (France), visiting Rheims, Châlons, Troyes, Langres, Dijon, Avallon, Vezelay, Auxerre, and Fontainebleau. The cost of the excursion will be about 250 francs, to include second-class travelling from Brussels, hotel accommodation, meals, carriages, and admission to monuments.

Another of the estates of the Liberator Building Society has just been disposed of by Messrs. Douglas Young and Co., the well-known auctioneers, of 51, Coleman-street, E.C. The final portion of the West Worthing Estate, comprising some 45 plots of freehold building land and six attractive freehold villas, were submitted to auction by Mr. Douglas Young on the estate on Friday last, when the whole of the land and three of the residences were disposed of for a sum-total of £8,332. Messrs. Douglas Young and Co. have recently sold the Liberator Building Estate at Norbury, comprising 59 acres, at the sum of £17,000. This disposes of four out of the five estates offered by this firm in the sale which aroused so much public interest in July last.

MEETINGS FOR THE ENSUING WEEK.

Saturday (June 18).—London Architectural Association. Visit to Paddockwood, Sussex, the residence of Sir Weetman Pearson, Bart. Train from London Bridge Station (L.B. and S.C.) to Three Bridges 2.25 p.m.
Northern Architectural Association. Visit to Durham Cathedral and County Council Offices.

Thursday.—Society of Architects. Special Meeting to Consider and, if approved, to Confirm Amendment of Article 11A of Association, St. James's Hall, Piccadilly. 8 p.m.

THE ARCHITECTURAL ASSOCIATION.
JUNE 18th, SUMMER VISIT to Paddockhurst, Sussex. Train leaves London Bridge L.B. and S.C.R. 2.25 p.m. P.O. for 3s. 6d. to be sent to Mr. Francis Hooper, 12, Norfolk street, Strand, before WEDNESDAY, June 15th. For further particulars see "Architectural Association Notes" for June.
E. HOWLEY SIM, G. B. CARVILL } Hon. Secs.

Trade News.

WAGES MOVEMENTS.

Advance of Wages to Joiners and Carpenters.—Advances of wages have just been conceded to joiners and carpenters in Birmingham, Castleford, Caterham, Colville, Cromer, Colwyn Bay, Liverpool, Leicester, Lincoln, Lynn, Mansfield, Whitby, Preston, Rushden, Leeds, Stockton, Carlisle, Gravesend, Maidstone, and Bournemouth. The average advances are of ½d. per hour, and in the foregoing towns they apply to over 5,000 men. In Birmingham the advance does not come into force until October 1st next, but in the majority of the other towns the advances are being put into force forthwith.

Banbury.—The members of the Banbury branch of the Amalgamated Society of Carpenters and Joiners have addressed a letter to the master builders in Banbury and district asking for an advance of a halfpenny an hour, on the ground that wages at Leamington, Rugby, and other towns in the Midlands are eightpence an hour, while in Banbury they are only 6½d. The men say it is twenty-one years since they had an advance of wages, and since then they have suffered a reduction of a penny an hour. They ask that the increase may commence on the 1st of July. The employers have agreed to have a conference with the men on the subject.

Leeds.—The threatened strike of plumbers in Leeds has been averted. The men have been receiving 8d. per hour, and some time ago they gave notice to their employers that they required an advance of wages to the extent of a penny per hour. They also desired to have considerable alterations in the working rules, and indicated their intention to come out on strike if their demands were not complied with. Several conferences took place between the Leeds district of the National Association of Master Plumbers and representatives of the workmen, and the masters endeavoured to effect a compromise by offering 8¼d. per hour. Last week the men would not accept this proposal, but at an adjourned conference, held at the Imperial Hotel, under the presidency of Mr. John Skirrow (chairman of the local branch of the Masters' Association), the men's delegates withdrew the demand for 9d., and accepted 8¼d. per hour. On the question of the working hours the masters gave way, and the operatives will now work 49½ hours instead of 50 hours per week, leaving off at 12 o'clock on Saturdays, whereas formerly the hour was 12.30. The working rules remain practically as they were, but a new rule has been added limiting the number of apprentices.

Liverpool.—The house joiners have been successful in obtaining an increase of ½d. per hour in their wages. This has been brought about through strong combination. The Liverpool ship joiners have not been so successful in their efforts as the foregoing, and a number of them are at present on strike; but there are now prospects of a speedy settlement of the dispute.

Manchester.—The annual conference of the Federated Builders' Labourers' Union of Great Britain and Ireland was held on Wednesday and Thursday in last week, at the Pack Horse Hotel, Bridge-street, Manchester, Mr. John Judge, of Leeds, presiding. Consideration was given to the question of old age pensions. After some discussion, the matter was adjourned. A resolution was carried in favour of Labour representation on public bodies. On the Wednesday evening the delegates were entertained to tea by the Lancashire organisation of Builders' Labourers. The 10th annual meeting of the Federation was held on Thursday night. Mr. Judge, who presided, spoke of the value of organisation, and urged all who were not connected with any union to at once become members. Mr. Quinn, Newcastle-on-Tyne, proposed: "That this meeting of builders' labourers pledges itself to use every effort to bring into one union every labourer who is working on a building, and who is still outside the ranks of trades-unionism." Mr. Tighe, a member of the Hull Board of Guardians, seconded; Councillor Belt (Hull) and P. Flanagan, general secretary, supported, the resolution being carried unanimously. Mr. Bennett, president of the Manchester branch, proposed, and Mr. Hood, secretary of the Building Trades Federation of Yorkshire, seconded the following resolution: "That, in the opinion of this meeting, the time has now arrived when all builders' labourers' unions should federate, and we offer to all branches a hearty invitation to join the Federated Builders' Labourers' Union of Great Britain and Ireland." Other speakers supported this resolution, which was cordially agreed to.

Wrexham.—The Operative Carpenters and Joiners having applied for an advance of wages, a large number of the employers have conceded an increase of ½d per hour, and so prevented a strike.

Wearside.—The Amalgamated Society and the Associated Society of Joiners on the Wear have claimed an advance of 3s. per week in wages. The matter will be dealt with by the Conciliatory Board.

CHIPS.

Memorial-stones of a new Wesleyan chapel were laid at Gorleston, Yarmouth, on Monday week.

Mr. Samuel Steel, late clerk of works to the Lambeth Vestry, died on Friday at his son's residence at Yarmouth, aged 73 years.

The Bishop of Bath and Wells opened on Monday the Weymouth House Voluntary Schools at Bath, which have been erected at a cost of £8,000.

The Duchess of Rutland opened, on Wednesday week, a home for poor children from Derby and Derbyshire which has been erected at Skegness on a site purchased and given by Sir H. Bemrose, M.P. The building cost £1,170. The building is capable of accommodating 24 patients, and has been furnished gratuitously by Derby people.

The funeral of Mr. William H. Hughes, who died at the residence of his father, 4, Russell-street, Liverpool, aged 28 years, took place on Friday, at the Necropolis in that city. He was a partner in the firm of Robert Hughes and Son, building contractors, of Liverpool and Seacombe. The large number of mourners testified to the esteem in which he was held.

The foundation-stone of the new chapel of the City of London Asylum at Stone, near Dartford, is to be laid on Saturday in next week, the 18th inst., by the Lord Mayor, who will be accompanied by the Sheriffs of London.

The Rotch Scholarship for 1898 has been awarded to Mr. L. C. Newhall, of Malden, Mass., a draughtsman in the office of Mr. Arthur H. Bowditch, of Boston. Mr. Newhall is the fifteenth holder of the oldest of the great American travelling scholarships in architecture.

The memorial chapel which has been erected at Llangefni to the Rev. John Elias, the great preacher with the Welsh Calvinistic Methodists, was opened on Saturday. The building was erected from the designs of Mr. Roberts, Portmadoc; Messrs. Williams, Upper Bangor, being the contractors. The cost is above £5,000.

The corner-stone of the new English Church at Lucerne, which is being erected by the Colonial and Continental Church Society, will be laid by Mr. F. R. St. John, Minister Plenipotentiary at Berne, on Tuesday morning next.

Corner-stones of the new Theatre Royal, Barnsley, were laid on Monday. Contracts to the amount of £10,000 have already been let, and a total expense of about £16,000 will be incurred in providing a theatre to accommodate 1,400 sitting, or a total of 2,000 when crowded. Mr. Walter Emden, P.S.A., London, is the architect, and the work is being carried out under the direction of Mr. H. Crawshaw, Barnsley.

The Bishop of Bath and Wells dedicated, on Monday, a new chapel, situated within the walls of the Bath Royal United Hospital. This chapel, built in the Classic style and seating about 150 people, forms part of a larger improvement scheme, carried out at a cost of about £2,000, which also includes new kitchens and scullery. Seats and fittings from the old chapel have been brought into the new, as also the old organ. The work has been carried out under the supervision and from the designs of Messrs. Brown and Gill, architects, of Bath, the contractors being local firms.

LIST OF COMPETITIONS OPEN.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2267.

FRIDAY, JUNE 17, 1898.

THE REVISED SCHEDULE OF PROFESSIONAL CHARGES.

WHETHER it is wise to substitute a new schedule of professional charges, such as that published and now under discussion, for the older and partially-recognised schedule issued by the Institute of British Architects, is a question of some moment for the profession. Some members of the Institute have expressed their doubt as to whether the trifling alterations and additions made are worth the risk of publishing a new form which is sure to provoke criticism and doubt. For, as we have had to point out before, no professional agreement as to charges or custom is binding on the public. We know what the Courts have held in this question, and it is exceedingly doubtful if any new arrangement will meet with the concurrence of judges. If the charges are established on custom, it may be said that it is not worth while to amend them. On the other hand, the old schedule is by no means a model of its kind: the clauses are intermixed, and the wording in some cases is indefinite.

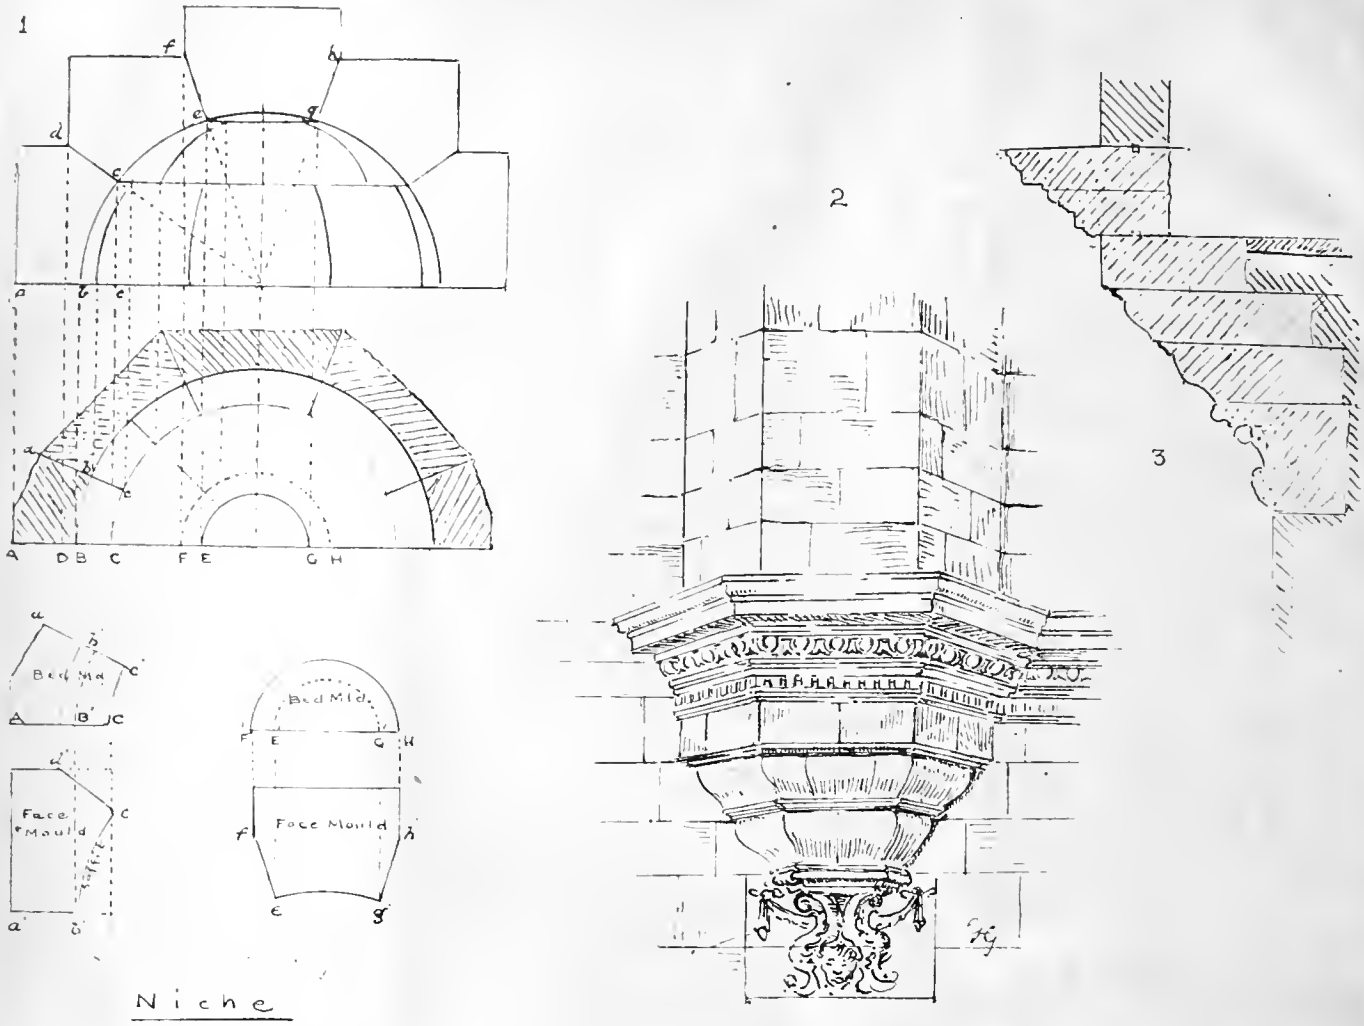
We refer our readers to the new or remodelled clauses published in our last issue, from which it will be seen that some of the old clauses have been improved and rendered more intelligible. Clauses I. and II., as amended on Mr. Wm. Woodward's suggestions, are certainly improved in some particulars. The transposal of the sentence relating to the clerk of works appointment from the first to the second clause is an improvement, certainly. It is better, also, that the architect's commission should exclusively be dealt with in the first clause without referring to subsidiary matters. If the reader will compare the old with the new schedule, he will find that the revised clause No. I. includes items that are now contained in other clauses of the old form. By incorporating them in one clause, all referring to what the architect's 5 per cent. includes, the schedule is much simplified; as we have also in the next clause a statement of what are not included in this commission. We are not quite sure whether the old words "executed from his designs" are not better than the substituted ones, "under his direction." The latter words appear to exclude design; though, practically, of course, an architect's directions would imply his design in most cases. No doubt, also, the substituted words may be argued as being more just to the profession, inasmuch as the architect has often to carry out buildings that are not strictly according to his design, the latter having been altered or modified by his client, and it would be open to a litigious client to say "it was not entirely his architect's design," but his own. We agree, however, with a suggestion made, that the clause would be better if the words were, "executed from his designs or under his direction." Clauses I. and II. as amended read:—1. The usual remuneration for an architect's services, except as hereinafter mentioned, is a commission of 5 per cent. on the total cost of works executed *under his directions*. Such total cost is to be valued as though executed by a builder with new materials. This commission is for the necessary preliminary conferences and sketches, approximate estimate when required (such, for instance, as may be obtained by cubing out the contents), the necessary, general, and detailed drawings and specifications, one set of tracings, duplicate specification, general superintendence of works, and examining and passing the accounts, exclusive of measuring and making out extras and omissions." It will be noticed this clause includes the old clauses 5, 11, 12. Claus II., as amended, runs: "This commission does not include the payment for services rendered in connection with negotiations relating to the site or premises, or in supplying drawings to ground or other landlords, or in surveying the site or premises, and taking levels, making surveys and plans of buildings to be altered, making arrangements in respect of party-walls and rights of light, or for drawings for, and correspondence with, local and other authorities, or for services consequent on the failure of builders to carry out the works, or for services in connection with litigation or arbitration, or in the measurement and valuation of extras and omissions. For such services additional charges, proportional to the trouble involved and time spent, are made. The clerk of the works should be appointed by the architect, his salary being paid by the client." This clause covers the ground now included in clauses 5, 7, and 11.

From these two clauses it will be seen that while the first states what are included in the customary commission of 5 per cent., the second distinctly states the items not embraced. The new words, "or for drawings and correspondence with local and other authorities," are desirable. It is impossible to define charges for all these services: they must be regulated by the degree of skill required or time expended. Clause III. embodies the old clauses 4 and 10, the first of which refers to works of small cost of £500, in which it is laid down that the charge should be by time, or by an ascending scale reaching 10 per cent. for works under £100 in cost. Clause 10 refers to alterations of premises, which generally involve much time and trouble. The revised clause states that in works of less cost than £1,000, and in designs for furniture and fittings, decorative painting, mosaics, sculpture, or stained glass, and in alterations, the "charge is regulated by special circumstances and conditions."

The insertion of £1,000 instead of £500 is an improvement, and is less likely to be questioned. This clause includes all works requiring special artistic skill in design and superintendence. Time and skill expended are here the chief considerations to be taken into account. A percentage on cost is a totally inappreciable method of assessing remuneration, and the words added in cases of alterations and additions to buildings include a class of work which the percentage commission is quite inadequate to pay for. Clause IV. is also important—it modifies Clause 3 of the old schedule. The new words—"but the arrangement does not apply to the reduplication of parts in one building undertaking, in which case the full commission is to be charged on the total cost"—are not very clear, and, on the whole, Clause 3 of the old form seems more definite and precise in its application. The other revised clauses, especially those of V., VI., VIII., XI., XIV., XVI., have been modified or rendered more explicit. The reference to the Office of Works custom in the old clause 6 has been omitted for the sufficient reason that the schedule was no longer in force. Clause X. substitutes the old clause 21, which refers to preparing specifications and superintending and certifying the formation of roads, fences, &c., for estates. A charge of 2 per cent. on estimate is proposed for this work, and when the roads, &c., are completed, an additional 4 per cent. On these and other revisions we shall again have to speak, and in the mean time we advise our readers to carefully peruse the revised clauses.

DUDLEY GALLERY ART SOCIETY.

THE summer exhibition of this Society, held at the Egyptian Hall, Piccadilly, comprises a few water-colour pictures and sketches of interest. We cannot say they are all worthy of exhibition. Many of them are the work of novices, weak in drawing or sentiment. As usual, there are a large number of seaside pieces, coast views, still life, and *genre*, and these classes may each be divided into original work and picture-making. But to proceed in the order of the catalogue. Several lady artists and amateurs contribute. The flower-painting of Mima Nixon is admirably restrained and natural. Her "Chrysanthemums" (2) is certainly one of the best works of the kind; the white, yellow, and deep red flowers are arranged loosely and naturally in a jug of dark bluish-green glazed ware, and the dark background is helpful. Near it Louise Furmage (8) has a study of rhododendron blossom, white and violet; the flowers are loosely thrown on a table, a basket standing behind—carefully painted, and without formality. Miss Margaret Bernard has several works of breadth and power. Her view from "Wapping, Looking Down the River" (6), with its craft and rippled surface reflecting the light, is a clever sketch. Few of her works are more pleasing than the view "Village Green, Frampton-on-Severn" (13), with the rounded masses of foliage and placid water reflection, and without doubt this is one of the best landscape studies. Her sketch of "Chain Gate, Wells" (74), is solid and broadly handled, the old gateway and tower of cathedral standing in strong shadow against a light sky. "Gateway, Chioggia" (140), is also a nice sketch, and firm in drawing, not always met with in ladies' work. Wiggs Kinnaird's "The Severn near Shrawley" (7), is worth notice for its delicate treatment of colour. The president (Mr. Walter Severn) has three or four subjects. His "Sunset, Biarritz" (10), is a carefully executed and effective view, and is in pastel. His "Como, after Rain" is more smooth and mannered; his best work is "Gorse in Full Bloom," a rich harmony of golden hue under a grey sky. "Scared," by Geo. Rushton, has the elements of good drawing and arrangement, and H. Sylvester Stannard's "Village by Sunset" (23) is pleasing. A. Duassut is a subtle delineator of landscape. His "Surrey Lane" (32) is finished and delicate with its leafless trees; and "The Outskirts of the Village," "Old Cottages, Amersham" (254), "Golden Sunset" (354), and other small sketches are feelingly done and extremely delicate, and are all dainty harmonies of colour. In quite a different style is Miss Evangeline Jex-Blake's work, No. 39, "The Vestner Thor, Nuremberg" (39), "View of Wells Cathedral and Glastonbury Tor" (68), are delightfully broad and true. Solid in handling is "Near Hengistbury Head, Hants" (155), and a nice suggestion of atmosphere and breadth of colour is seen in her view of "Verona" (266). We pass a few tame and weak drawings, like "A Quiet Summer Evening on the Stour" (52), and come to one of Henry Terry's specimens of portraiture. His "Old Buckinghamshire Lacemaker" (55) is pleasant as a piece of *genre*. The old woman with her lace, and the young girl with a basket of provisions, are drawn with Mr. Terry's usual truthfulness. There is a harmony of grey tones and browns and russets in Berenger Benger's delicately-wooded landscape (65) "Sad December." There is also a sympathetic note in it. Frances E. Nesbitt's "Thrashing Corn" (70), is an honest piece of work. There is movement and vigour in the farm labourers busy at their threshing operations, and the colour is admirable. Miss Maud Turner's figure subject "At the Sign of the 'Red Dragon'"—a country girl feeding pigeons at the door of an inn—is drawn feelingly, and the colour is pleasing. No. 73, "On the Grand Canal, Venice," by D. W. Hereford, is harmonious in colour; light and atmosphere are given by

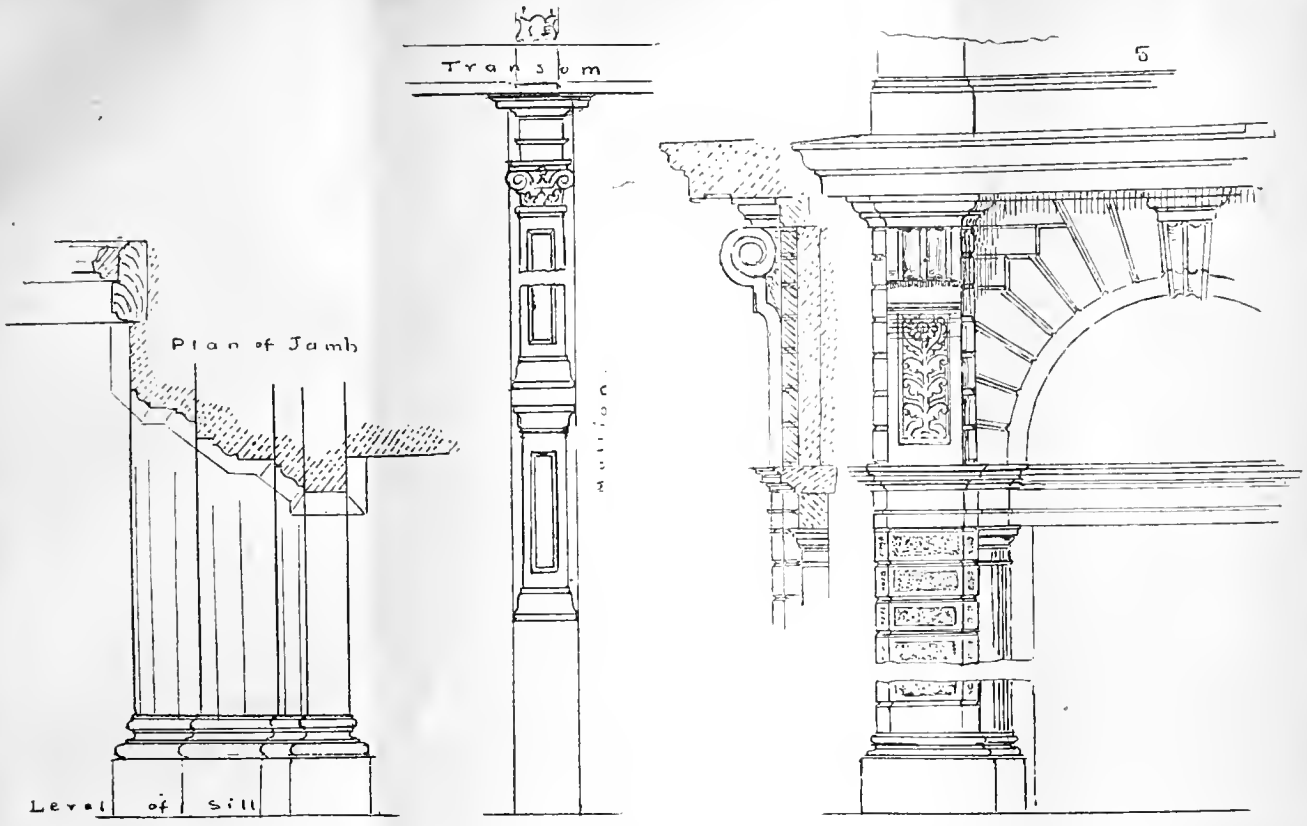


thin and transparent handling. Next, Albert Stevens contributes a fine view of "Mentone" (78), taken from the hills at the back of town. The bay and town nestling between the hills is effective. "Near Cape Martin" (153), and a clever sketch of moor with its rough heather and gorse, "Harlow Moor, Harrogate," may also be noticed as examples of the industry of this painter. The gallery would be incomplete without a specimen of L. Block's finished work in still life. The minuteness of the old volume open, with the engraving and the soiled plate, is marvellously realistic. There is admirable effect in the view of "Sand Hills, Pas de Calais" (80), by Miss Rose Douglas. This lady artist is an expert in the blending of wet colours. Stiff and unnatural is "A Rehearsal" (82); H. W. Mesdag has a nice sketch (83); Miss Maud Turner's "Study of a Head" is meritorious for its colour and pose—rich auburn hair tied up with a band of blue ribbon. There is a want of atmosphere in the distance of H. Sylvester Stannard's landscape (100). We note a sketch by L. Burleigh Bruhl for its nice tone and wooded banks, "On the Wye," and Harriet Skidmore's very masterly rendering of the sea, breakers, and surf over rocks (111). Mrs. Mariquita Moberley (121) sends a sketch of Ruskin's study at Brantwood, interesting as showing the homely tastes of the great art critic and writer. The fireplace has over it a keramic panel representing the Virgin crowned by angels, and at the sides are shelves of old pottery and books, treasures of the author. H. W. Mesdag, of the Hague, sends three masterly sketches in monochrome—seascapes in black and grey. "In Danger" (129), a boat, with crew, flying signals of distress in a rough sea; "Rough Weather on the Dutch Coast"; and "The North Sea" (163)—all faithful renderings of rough sea and swelling waves in black and yellow tone in broad vigorous dashes of the pencil. Rose Douglas's view at Etaples (160) is a broad and grey-toned sketch showing power. No. 165 "Blue Bells, Epping Forest," by H. G. Stormont, is a delicate and dexterous piece of work. We may also note the work of Mrs. Jane Inglis "Whitby" (187), a nice sketch of red-tiled cottages climbing hill; and a bright sketch of the same place, "Bringing in the Fish," by another lady, Ethel Kirkpatrick (188); also a view of St. Bartholomew the Great, by Miss Rickenbach. Another lady, Mrs. James Jardine, sends a vigorous sketch of "Filey Brig," a rocky piece of sea-coast cleverly done. Miss Turner has a pleasing figure study, "Cinderella" (190), Miss B. Wigan a brilliant sketch of a Gipsy Encampment (205), Lexden L. Pocock a study by the riverside in the dusk of evening (203), and F. A. Howarth a pleasing study of "Table Mountain, Robbin Island." Miss M. A. Cooper's pots and wallflowers "Ready for Potting" (212); a pair of little sunset landscapes by George Marks, a clever sea-piece with boats getting ready for the tide (218), by C. Topham Davidson, are worth passing notice. The ablest coast scene is T. S. Hutton's "Cemaes Bay, Anglesey" (226), a large and skilfully handled coast view: the waves are breaking over a rocky shore, and there is motion and freshness imparted. The flock of sea-birds gives life to the scene. David Green's sketch of "Springtime" (229), is broad, and the colour fresh. One of the finest landscapes is Mrs. Mary Stevens's "Summer Time in the Engadine" (258), quite Whirterian in manner, the wild flowering grass on the valley sides and the distant hills are delicately and effectively painted. Miss Bessie Wigan's "Over the Linton Moor," and Miss Janet Fisher's work (260), and a few other drawings and sketches by J. Maud Peel (272), M. Rose (273), Gertrude Crompton (280), J. Carlisle (300), Reginald Jones (310, 296), Lady Adelaide Taylour (292), Miss Pughe's figure of a Cavalier, may be mentioned as works of merit, besides a few on the screen. There are many feeble and tame productions which detract from the character of the exhibition.

MODEL SPECIFICATIONS.—XVII.

MASON.

In the specification of particular works it is as well to preface the clauses by saying what particular kind of stone is to be used, the modes of fixing and jointing, whether by metal or slate dowels, their length and substance, or cramps of bronze, and the material—lead or Spence's metal—used for running in the same; the kind of joggles, as V-joggles. The sizes of all details not figured in the drawings ought to be always given; for example, the extreme dimensions of sills, architraves, jamb mouldings, mullions, cornices should be stated, the beds of these items, heights of stones for jambs and columns, lengths of stones for cornices, &c. In our clauses we have only suggested dimensions; but they are necessary for the quantity surveyor as well as the mason. A general clause ought to be inserted as to the beds and joints, the kind of finish to face, the pointing, and that the work is to be cleaned down at completion and left perfect to the architect's approval. In specifying Bath stone and other kinds, it is necessary to say that the stones are to be well seasoned and hard, shown by their resistance to the pressure or point of a tool, and sometimes it is specified that the stone is to be selected by the architect or clerk of works. For steps, sills, landings, and stairs, the



older the Portland stone is, the harder and more suitable. The selection of stone for such features as dressings, columns, niches, and other details is essential. If of Portland, the bed should be specified as "Whitbed," or if of Bath, they should be of Box Ground, Corsham Down, Combe Down, or Monks Park, which are all good weather stones, and the latter fairly compact and even-grained. But only experience of quarries and working can give the requisite qualities; as sometimes it is better that the requirement as to quarry bed in setting is not enforced. But for columns, architrave dressings, cornices, and other exposed stonework, this ought to be required.

The neglect of setting stone on its natural quarry bed is constantly seen in London. All oolitic and arenacious stones (sandstones) should be laid on their quarry bed. We see the laminæ of sandstones placed on edge—equally absurd, as it has been remarked, as placing a weight on the leaves of a book standing on edge, and also allowing moisture to enter.

Our first diagram shows how a spherical niche head is formed with horizontal splay beds and vertical joints. The plan and elevation with the dotted vertical lines will sufficiently explain how the radiating joints of elevation are obtained from projectors of plan, as, for example, those of A B C, &c., on plan determine the joints in elevation, *a*, *b*, *c*, *c d*, *e f*, &c. To obtain the joints of the stones on plan or the spherical surface, ordinates are projected from the points of elevation corresponding, and the concentric circles described at the points so obtained on the horizontal line, A B C, &c. These give the horizontal lines of splay joints in the spherical surface of head. For breaking joints these semicircles are divided equally into four parts, as shown alternating. Radiating lines drawn to centre of plan will give the joints on plan. The vertical joints in elevation are obtained by projecting ordinates from plan, as shown by dotted lines. The springers or first stones of the head of niche will be of less thickness than the others in the lower course (about one half), in order that they should break joint with the vertical joints of course above. For this purpose on the outer circle, B on plan, set off the first radiating joints *a c*, and the corresponding joint, equal to half one of the three other stones, as shown in plan. The method of finding the bed-mould and face-mould of springer is shown by the digrams below the plan, and will be easily understood as being produced from the prolongation of the same vertical ordinates A B C, *c d*, &c. The face-moulds may be transferred from the elevation *a b c d*, and the same with the course above, *c d e f*. The stone used to work this will be a wedge-shaped prism. We also show how the bed and face-mould of keystone is obtained. The bed-mould is transferred from plan, and the face-mould from elevation.

Corbels and corbelled projections are important items of wrought stonework. Provision should be made for tailing the lower stones into the wall, pinning them with slate and cement, and bonding the work. Unless a drawing with dimensions is given, the dimensions of the stones, their length, including the part tailed into wall, and their length if moulded or splayed, or enriched by carving, should be stated, whether any of the stones are to be plugged with lead, dowelled, or cramped. Sketch (Fig. 2) shows a moulded corbel with carved springer in four or five courses, and a section showing the courses. For small corbels, two courses would suffice. A single stone could be used for the lower course, and another including the projecting and enriched cornice (see clause 40).

The design for jamb mouldings (Fig. 4) and mullion for a window of the Renaissance character, shows an architrave with two faces projecting 3in. from the wall face of ashlar, which may be worked in two stones at the first reveal (see plan). The outer projecting part of the architrave may be 8in. deep, and the inner part 9in. or 10in. rebated for wooden frame. The mullion is enriched by a pilaster on face, with pedestal and capital; above the transom it is carved as a half-baluster. We also give details for a stone doorway with projecting cornice resting on carved trusses, and with rusticated piers and arch. Clauses are given for these details.

39. *Niches.*—The niches shown in elevations (or details) to be constructed out of selected blocks of Portland stone, the head to be in two stones hollowed, jointed in centre, and to be 4in. (or 6in.) thick in the thinnest joint, well grouted with Portland cement; the cylindrical part of niche to be of solid stones in two courses the full height of niche from base to springing. The vertical joints to break joint, and to be equally arranged on each side, well filled behind with cement, and to be made to bond with the wall. The architraves and pediment to be executed according to details (see Figs. 6 and 7, page 805). Or—

The spherical niche (see sketch 1) to be executed according to large scale (or full-size drawings). The stone to be of selected blocks of Portland (or other stone), and the head of niche to be constructed with splayed horizontal beds and vertical joints in three courses, set out from proper bed and face-moulds according to rule. The beds and joints to be correctly and truly worked to even surfaces, the keystone to be joggled. The courses of the head to be cut out of solid stones not less than 6in. thick in any part, and to be well bonded, and filled in at back with cement. The cylindrical part of niche to be of two or three courses in height, three vertical joints under the springing and four joints alternately, well bonded to wall and grouted in cement. Or—

The niche-head to be formed with vertical radiating joints; describe number of stones, worked according to bed and face-moulds with true and accurate surfaces. Below the springing the stones to be in two or three courses of not less than 6in. (or more) in thickness, breaking joint, and well bonded to walls.

40. *Corbels.*—The projecting windows (marked A on plan), are to be carried on a 4in. hard tooled York stone landing (8ft. by 3ft.) in one piece, cut and pinned into wall in cement. (If stone trusses underneath are used, describe the length and depth of truss and the distance it is to be tailed into wall.) See sketch.

The Portland stone corbels to turrets to be as shown in detail drawing in two (or three) moulded courses, which are to bond into wall to a depth of at least 9in. (or 12in.), the stones being plugged with lead at the joints, and dowelled at the beds with metal dowels in cement (if thought necessary). The corbel stone in the lowest course to be carved to full-size models approved by the architect. Or—

The corbellings under octagon turrets to be as shown in detail (sketch 2), in four courses, with mitred returns of wrought and moulded and enriched Portland stone, bonded into wall at the sides; the lower two courses to be tailed into the masonry at least 18in., and the outer end of bottom course to be carved to a full-size model approved by the architect. The upper course of corbel to form an enriched cornice, with egg-and-tongued and dentil enrichment. All requisite joggles or dowels and cramps to be used.

41. *Cove to Cement Cornice.*—The main cornice to have a rough York stone core 3in. thick tailed into wall 12in. (or 18in.), in lengths of not less than 5ft.

42. *Columns and Pilasters, &c.*—The columns and pilasters to doorways and window dressings to be monoliths (or in two or three blocks of stone). The pilasters to be bonded not less than 4in. (or 6in.) into the wall. The entablature and pediments to be executed with all requisite joggles and cramps of metal or slate, and the apex of pediment to be in one stone. The caps and bases to be in large stones bonding with the masonry.

43. *Doorway* (see sketch 5).—The jambs to be worked according to detail with Portland stone, three-quarter columns 8in. diameter, cap and base set in the angle between reveal and rusticated pier, with wrought-stone entablature over to form a transom. The recessed arch over column to be square in section, with sunk panel and enrichment (see detail), with radiating joints to bond into masonry. A moulded keystone to be executed to the architect's satisfaction. The side trusses above impost mouldings to be executed according to models approved and carved to the architect's satisfaction. Each to be 2ft. by 18in. and 4ft. in height, extreme dimensions, securely tailed into wall. The projecting cornice (or head) to be weathered moulded on edges, with bed-moulding, mitred round trusses, and keystone, and it is to be securely tailed into wall at least 12in. or 18in. The soffit to be sunk (or panelled), and to have proper drip. The cornice to be channelled and plugged with lead at the joints. Or—

The main doorway to have moulded and carved jambs and arch according to detail drawing (describe if the arch is rusticated or moulded and sunk on face or carved), with voluted keystone carved according to model prepared from drawings, the radiating joints or beds to be truly worked to bed- and face-moulds, and the stones of jambs and arch to be rebated to receive the frames. The jambs to have through bonders every third (or fourth) course. (If a circular hood instead of a flat cornice, specify to be formed of three or five stones with radiating joints, the inner ends to go into wall 9in. or 12in., and to be pinned securely in cement with sunk panels on soffit, mitred bed-moulds over trusses. Each joint of hood to be plugged with lead.)

SOCIETY OF ENGINEERS.

AN extremely interesting visit was made by a party of the members of the Society of Engineers on Tuesday, the 14th inst., to the works of the Gaslight and Coke Company at Fulham, and the Gigantic Wheel at the Earl's Court Exhibition. Amongst those present were Mr. W. Worby Beaumont, president; Mr. H. Adams, past-president; Messrs. J. Patten Barber, J. Bernays, G. Burt, D. B. Butler, Percy Griffith, R. St. George Moore, M. Wilson, members of council; and Mr. G. A. Pryce-Cuxson, secretary.

DESCRIPTION OF THE GASWORKS.

The coal received, amounting to 130,000 tons per year, is unloaded by Hone's patent single chain grabs (capacity 1 ton, each lifting 45 tons per hour), and deposited into bunkers, from which it is distributed to the several retort houses by small waggons. When storing coal in the open it falls down shoots from the bunkers into a conveyor of the push-plate pattern, and is carried along to the storage ground, where it is dropped from a shoot at the end of the conveyor into small waggons, which are run and tipped so as to form a heap of an average depth of 10ft. to 12ft. The total coal storage is 30,000 tons; 14,000 in retort houses and 16,000 in the open. The retort houses, of which there are six, have a capacity of 9,000,000 cubic feet per 24 hours. They contain 760 retorts 20ft. long, and are heated by generator furnaces, which require about 20 per cent. of the total make of coke for fuel, leaving 80 per cent. for sale. The heat of the retorts is about 2,100° Fahrenheit, and on the average 10,000 cubic feet of gas are distilled from 1 ton of coal, each retort producing about 12,000 cubic feet of gas per 24 hours. The exhausters—rotary pumps—are used for the purpose of exhausting the gas from the retorts, and forcing it through the purifiers and other apparatus into the gasholders. The condensers — stacks of pipes through which the gas flows up and down—are for the purpose of reducing the temperature to about that of the atmosphere, and of removing from the gas all tarry or solid particles. The scrubbers—tall towers in which are placed beds of tightly packed coke or boards on grids, and down which ammoniacal liquor or water is sprayed—are for the removal of the ammonia from the gas, which travels in an opposite direction to the water. A considerable proportion of sulphuretted hydrogen and carbonic acid is also removed in the scrubbers. The purifiers are rectangular boxes, with lids sealed by water lutes, in which are placed the purifying materials in layers, usually six, and of a depth of about 4in. The impurities in the gas when it arrives at the purifiers are carbonic acid, sulphur existing as carbon bisulphide, and sulphuretted hydrogen, which are eliminated by slaked lime, oxide of iron, and weldon mud, the last two materials, however, being only used for the extraction of the sulphuretted hydrogen. The gas, after leaving the purifiers, passes through the station meters, where it is registered, and thence into the gasholders.

DESCRIPTION OF THE GIGANTIC WHEEL.

The Great Wheel at Earl's Court, althoug entirely of English manufacture, is more or less an American innovation. Mr. W. B. Basset prepared the drawings, with the aid of Mr. J. J. Webster, M.Inst.C.E., consulting engineer to the company. The Gigantic Wheel and Recreation Towers Company was formed, and in March, 1894, the work commenced. The foundations consist of eight solid cubes of concrete, each weighing over 250 tons, with steel bolts 16ft. long bedded into them, and to which are attached the bases of the eight columns. These columns are each 4ft. square, built of steel plates with internal diaphragms. The first and second lengths of these columns were hoisted into place by a 96ft. pair of shear-legs. To erect the upper lengths of the columns, a wooden stage was built across the gap through which the wheel now revolves, and on it two Scotch cranes were set up, one to work on each side. About the middle of July the columns were completed, and the great axle, built of 1in. steel plates and 9in. steel girders bent into circular form, was brought from Messrs. Maudslay's works at East Greenwich to Earl's Court. To hoist it into place the wooden bridge was used, with a strong trolley fitted on it to run on rails. With tackles hung from this trolley, the bearings, weighing 11 tons each, and the axle, weighing 57 tons, were hoisted. The first quadrant of ten spokes was built in the following manner:—A spoke was hung from the axle, the length being carefully adjusted to gauge, and the portions of the periphery, or outer ring, were attached. Two powerful tackles, capable of exerting together a pull of 120 tons, were fixed to an anchor-post, and towards this anchor the spoke was hauled out of the way when finished. Another spoke was then hung in its place, and connected to its periphery girders, and in this manner the ten were hung and adjusted until the quadrant was hung so that the last spoke erected was vertical, when the steam-winches actuating the tackle could pull no more. The second quadrant was built from a scaffold 150ft. high; the first and second quadrants balanced each other, and all the strain was thus removed from the anchor. For the third quadrant, a strut, which weighed alone over 60 tons, was securely fixed in the first quadrant; the tackles and anchor were again brought into play. The fourth quadrant was erected by building the inner periphery girder, by aid of a hanging scaffold, to bridge the distance between the first and third quadrants, and from it the outer periphery and spokes were erected. The last two bolts in the outer peripheries were driven by Mrs. Walter Basset at a height of 280ft. on April 26th. Since the completion of the Earl's Court Wheel, Mr. Basset has, with the help of his two assistants, Messrs. C. F. Hitchens and H. C. Booth, A.M.I.C.E., designed and erected a gigantic wheel at Blackpool, and another at Vienna, and is now engaged on the erection of one in Paris larger even than the Earl's Court Wheel. A comparison between the methods adopted both in the design and erection show the result of experience, combined with careful study. The weight of steel used in the Earl's Court wheel, amounting to 1,200 tons, has been reduced in the Paris wheel to 783 tons, although the Paris wheel is the greater, without in any way jeopardising the safety of the public. The axle, instead of being of boiler plates 7ft. in diameter, is a solid forging, 26in. in diameter, weighing 32 tons. The cars are hung on cantilevers, instead of between the periphery girders, giving a lighter and more graceful appearance. The erection is effected by means of two Scotch steam cranes with jibs 100ft. long, on stages 250ft. high. These are believed to be the highest crane-stages ever used. By means of these cranes every portion of both columns and wheel are lifted direct into position with the exception of the axle which was lifted on the 7th April by means of wire rope tackles.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XXIV.

By AN ASSOC. INST. ELECT. ENGS.

INCANDESCENT LIGHTING — (*continued*).

CANDLE-POWER, VOLTAGE, AND CURRENT.—The amount of light emitted from different-sized lamps varies considerably, and the purposes for which glow-lamps are now used also vary considerably. They are used for illumination purposes, as in house-lighting; for adornment and decoration, as in illuminating jewelry, flowers, headdresses, &c.; and in medicine, surgery, and dentistry. They are, therefore, made in a great variety of patterns and sizes, and are also made to work at voltages varying from 2 to 230 volts, according to circumstances. Glowlamps are therefore known as 5-volt, 60-volt, 100-volt, or 220-volt lamps, as the case may be. Now, from an engineering point of view, the value of a lamp depends upon its efficiency, so that it is necessary to investigate the relationship between the amount of light emitted and the amount of electrical energy supplied. To enable us to do this, we must now refer to several important factors in detail, which have to be taken into consideration in such determination. For instance, the amount of light emitted, or the illuminating power of a glow-lamp, is measured and expressed in terms of the light emitted by some standard under definite conditions, and it may be remarked here that the question of a luminous standard is still one of controversy, no one standard of illuminating power having as yet been universally adopted. The requirements of such a standard are obvious; it should be a source of light perfectly definite, invariable, and easily reproduced — a candle for use as a standard should be one of definite composition, burning at a definite rate, under perfectly definite and fixed conditions. In this country and the United States the standard of illuminating power is the *Standard Candle*, which is a sperm candle weighing six to the pound, and burning at the rate of 120 grains per hour. A glow-lamp of 8 candle-power (8c.p.) is thus one that gives out as much light as eight standard candles, and incandescent lamps are usually designated 5c.p., 8c.p., 16c.p., or 32c.p. lamps, according to their illuminating powers.

Now, since light is radiant energy, probably the best definition of illuminating power is as follows:—The illuminating power of a source of light is the quantity of light which falls upon unit surface at unit distance from the source, the unit surface being placed so as to be perpendicular to the rays. This definition assumes that the source emits light uniformly in all directions, as then the amount of light falling upon the unit surface would be directly proportional to the total quantity of light emitted by the source. The determination of the candle-power of a lamp is obviously an important operation, for which purpose some form of *photometer* is used. The subject of photometry is generally well treated in the standard textbooks on Light, to which we refer students not well acquainted with this subject. As the battle of luminous standards is not yet decided, it will be, however, interesting to briefly describe the chief standards which have been proposed.

The *Carcel* lamp, proposed in France, is of definite dimensions, burning 42 grammes of colza oil per hour. The objection to this as a standard is that it does not preserve its uniformity long at a time, and the precautions which have to be taken, and the regulation required to eliminate several sources of error are tedious, and render it unsuitable for continuous use. The *Violle* lamp, of molten platinum, has also been proposed, and, although it was adopted by the International Paris Conference of 1881, it is too impracticable to render it fit for general use. The *Hefner-Alteneck* lamp, adopted in Germany, is simple in construction, easy to manipulate, and not troublesome. This lamp is of definite dimensions, burning amylacetate, with a flame 4 centimètres high. The *Reichsanstalt Unit* has also been used in

Germany, it being the light emitted from one square centimètre of platinum raised to a definite high temperature. Another lamp proposed in this country is the *Vernon-Harcourt* lamp, which is a simple lamp burning the vapour of standard quality pentane with a flame of such a size to give a light equal to two standard candles. The relationship between the above standards has been stated to be as follows:—

One standard candle = 0·1053 Carcel = 0·0506 Violle = 1·14 Hefner-Alteneck.

Generally speaking, glow-lamps are made to give candle-powers varying from ¼c.p. to 100c.p., the candle-power of a lamp depending upon nature, shape, and dimensions of the filament; and, assuming uniformity of material, it depends upon its total superficial area—i.e., its length and thickness. The length and thickness also decide the pressure at which the current is to be supplied, whilst the sectional area of the filament decides the current required. Thus, by suitably arranging the voltage and ampèrage, a long thin filament may give the same candle-power as a short thick one. Furthermore, lamps giving the same candle-power, and having the same efficiency, absorb the same amount of energy—i.e., the same number of watts, and since the watts absorbed equal the product of the voltage and ampèrage, it is obvious that as the volts increase, the current required will be diminished, and *vice versâ*. For the purpose of explanation, we may consider the 100-volt 16c.p. lamp as a standard of reference, since it is so generally used, and, taking the energy absorbed as 60 watts, it is clear that at 100 volts pressure such a lamp takes 0·6 ampère. If a 16c.p. lamp with the same efficiency be required to work at 60 volts, then the current will be one ampère. At 50 volts the current will be 1·2 ampères. Now, since R = E ÷ C (Ohm's Law), the resistance of the 100-volt lamp filament will be 100 ÷ 0·6, or 166·6 ohms, the 60-volt lamp 60 ÷ 1, or 60 ohms, and the 50-volt lamp 50 ÷ 1·2, or 41·6 ohms; and, as we have already indicated, the filament diminishes in thickness as the voltage increases. There is thus evidently a certain voltage at which each lamp should be run, and it is soon found that if the voltage is varied much there is considerable difference in the light emitted. It has, in fact, been shown that the candle-power of an incandescent lamp varies as the 6th power of the E.M.F., the 5th power of the current, and the cube of the energy expanded. The following is the result of a test of a 16c.p. 50-volt lamp with different currents:—

Candle-power..	0·4	5·1	15·8	50·7	103·	141
Current	0·56	0·9	1·06	1·29	1·48	1·58
Volts	25·	40·	56	62·	72·5	80·
Watts	14·	36	59·3	80	107·	126·

It is apparent that engineers should keep the fluctuations in the voltage a minimum (certainly not more than 1 or 2 per cent) by paying proper attention to the generators, engines, and governors; otherwise the lamps, especially those with high frequency, will give way, and so shorten enormously their life.

Efficiency and Life.—The term *efficiency* denotes the *ratio* between *output* and *input*, or—

$$\text{Efficiency} = \frac{\text{output}}{\text{input}},$$

and, as such, the efficiency of an incandescent lamp should theoretically be the ratio of the energy in the luminous rays to the total electrical energy absorbed by the filament; usually, however, by the term "efficiency" is meant the *specific illuminating power*, or the ratio of the illuminating power of a lamp to the electrical power absorbed; that is to say the efficiency of a lamp—

$$= \frac{\text{Number of } \textit{candles yielded} \text{ by the lamp}}{\text{Number of } \textit{watts absorbed} \text{ by the lamp}}$$
$$= \text{Number of candles per watt}$$
$$= \text{Candle-power per watt.}$$

Therefore, the greater the value of this ratio, the higher the efficiency, and for a new lamp the efficiency varies from one-third to two-ninths candle per watt. It is somewhat strange that lamp manufacturers often incorrectly express the efficiency of a lamp by taking the ratio of the electrical energy absorbed to the light emitted (*i.e.*, watts per candle-power), which, of course, gives the actual *specific activity*, and not the efficiency.

This is obviously the reciprocal of the actual efficiency, since the greater the value of this ratio (specific activity) the greater the inefficiency of the lamp, so that the real efficiency of a 3½ watts per candle-power lamp (as given in trade catalogues) is $\frac{1}{3\cdot5}$ or $\frac{2}{7}$ candle per watt. The efficiency of a glow-lamp really depends upon the temperature to which the filament is raised, and as we have already indicated a lamp is more efficient the higher the temperature at which it operates, since the light emitted increases much more rapidly than the energy supplied, so that the efficiency of a lamp increases with the power

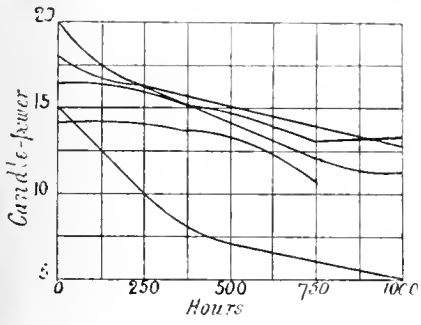


FIG. 83.

supplied to it; but, as would be expected, the duration of its existence is diminished.

When a new lamp is supplied with current at the constant pressure for which it was designed, say 100 volts, it is found usually that its illuminatiog or candle-power gradually decreases; in other words, its efficiency diminishes. This is due to the fact that the filament is gradually being disintegrated, so that its diameter is reduced and its resistance increased. A secondary result also occurs, in that the fine particles of carbon are deposited on the inside of the glass bulb as a black semi-opaque coating, which diminishes the illuminating power by obscuring the bulb. This disintegration and reduction of the filament is due to (1) mechanical, (2) chemical, and (3) physical causes. Thus, (1) the occluded gases in the surface layers of the filament are evolved explosively; (2) chemical combination takes place between the carbon and some of the constituents of the remanent gases, and (3) dissociation, volatility, and evaporation of the carbon take place under the influence of the high temperature and electrostatic attractions. Furthermore, considerable increase emissivity of the surface takes place, in consequence of the surface change due to the reduction of the cross-section of the filament, the result of which is that the same quantity of activity per unit surface is radiated at a lower temperature.

Experience has shown that the falling off in

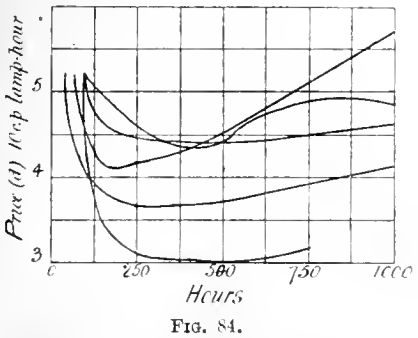

FIG. 84.

candle-power during the life of a lamp is far more rapid with high-voltage lamps than with low voltage ones, and from comparisons made between flashed and unflashed filaments, it has found that the efficiency of unflashed filaments decreases in a given number of hours by a far greater percentage than is the case with flashed filaments—in other words, the change in the candle-power is slower at the same efficiency with filaments of low specific resistance and low emissivity (flashed) than with filaments of higher specific resistance and great emissivity (unflashed). Now, the question of the life of a lamp is an important one, and from what has been said it is clear that the gradual diminution of light with age implies that a time is ultimately reached when the efficiency is so low that it is more economical to replace the lamp with a new one, although the filament may not be broken. In fact, cases have been known in which the efficiency of a lamp of long life has fallen to ½ candle per watt. In some cases the filament breaks before this stage is reached. The length of time during which it will be advantageous to continue the use of a lamp can only be decided by investigating its *economical efficiency*, the value of which is determined by considering the diminution of efficiency with age, cost of lamp, its life, and the cost of the energy supplied. The most economical efficiency is that at which the cost of working the lamp is a minimum. If the lamps are good and inexpensive whilst the cost of the energy is high, then the lamp should have a high efficiency, and with inferior and costly lamps and cheap energy, the efficiency of the lamp should be low. It has been shown that the total cost of energy and lamp renewals is a minimum when the cost of lamp renewals is about 15 per cent. of the whole. If above 15 per cent., the efficiency of the lamp is too high.

To indicate the moment in the existence of a lamp when it is most economical to replace a lamp with a new one, Mr. O'Keenan has introduced the term *smashing-point*. This point is determined by plotting a certain number of curves showing the peculiar characteristics of a lamp, and enabling us to estimate its value at any instant of its existence from various points of view. All these curves are plotted with hours of service as abscissæ, and with the following quantities as ordinates:—

A.—The electric energy in watts consumed at any instant.

B.—Candle-power (Fig. 83).

C.—Energy consumed (watt-hours) since the lamp was put into service (*i.e.*, the integral of curve A).

D.—The quantity of light produced by the lamp (candle-hours) since it was put into service (*i.e.*, the integral of curve B).

E.—The cost of the energy (in pence) consumed by the lamp since it was put into service. Curves C and E may be made one by a suitable choice of a scale of ordinates.

F.—Total cost of the lamp (in pence) since being put into service; a curve which is obtained by raising the curve E by an amount equal to the price of the lamp.

G.—Specific cost (Fig. 84) at any instant, in pence, per candle-hour; obtained by taking the ratio of the ordinates of curves C and D.

$$\text{Specific cost} = \frac{\text{Total cost in pence}}{\text{Quantity of light in candle hours}}$$
$$= \text{Total cost per candle per hour.}$$

This last curve characterises every type of lamp working in a given manner. It shows, generally speaking, that during the first hours the specific cost, asymptotic to the axis of *y*, rapidly diminishes, then falls more slowly to a minimum, and then ascends indefinitely, owing to the reduction of the candle-power. There is, therefore, a moment at which a given quantity of light has been obtained for a minimum price. It is precisely at that moment that we must remove the lamp, replace it, and break it, or rather, return it to the maker, and obtain a small sum for it.

In the early days of electric lighting, it was usual to estimate the value of a lamp by its *initial* consumption of energy in watts per candle, and by the *average* life guaranteed by the makers. The two desirable qualities of an incandescent lamp are, however, now considered to be:—

1. Large percentage retention of original candle-power during its life; and

2. Large average percentage retention of original efficiency during its life.

The following results obtained by Messrs. Siemens and Halske prove that if an initial efficiency too high be adopted, the constancy is inferior:—

1½ initial watts rose to 4·45 watts after burning 55 hours.
2 initial watts rose to 3·99 watts after burning 90 hours.
2½ initial watts rose to 3·58 watts after burning 150 hours.

We also include a table containing the mean

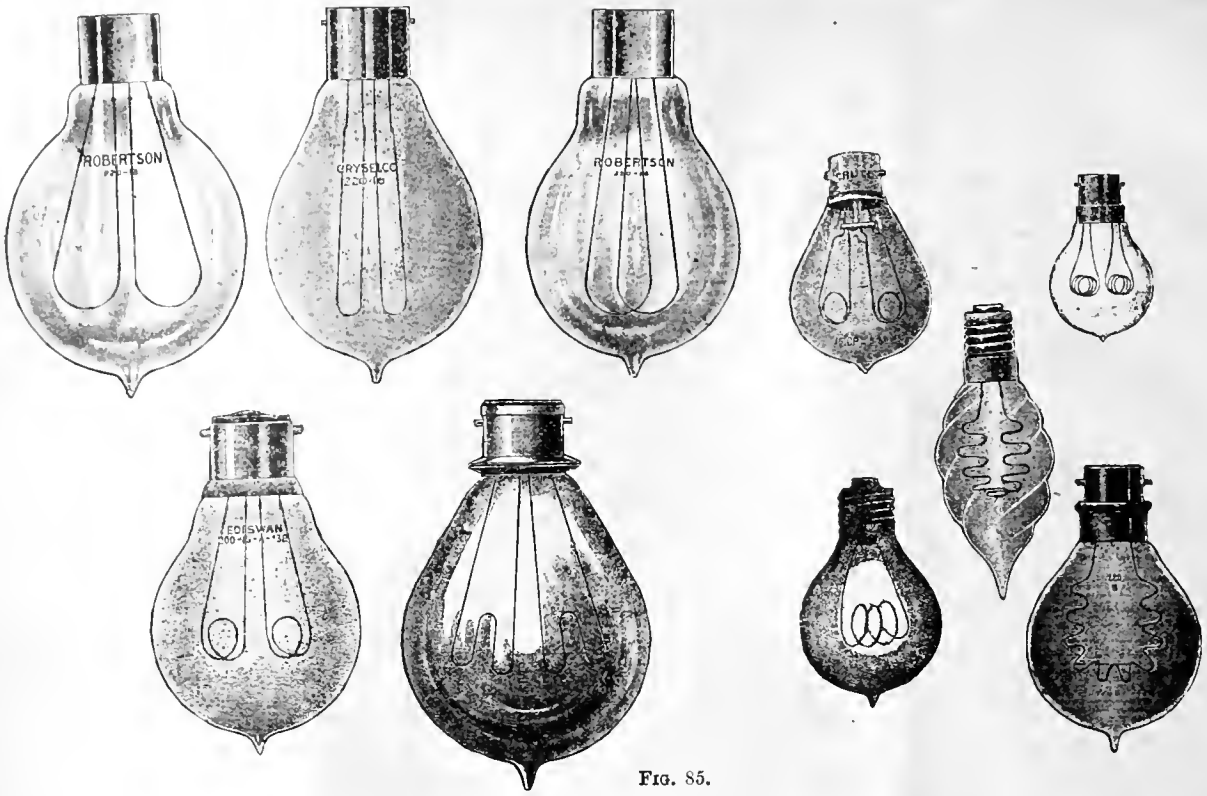

FIG. 85.

values of tests of more than 500 lamps of 49 different types.

Hours after start.	Initial consumption in watts.									
	2·0 to 2·5		2·5 to 3·0		3·0 to 3·5		3·5 to 4·0		4·0 upwards.	
	c.p. in percent.	Watts per c.p.	c.p. in percent.	Watts per c.p.	c.p. in percent.	Watts per c.p.	c.p. in percent.	Watts per c.p.	c.p. in percent.	Watts per c.p.
0	100	2·4	100	2·9	100	3·3	100	3·8	100	4·5
100	84	2·8	93	3·0	95	3·4	96	4·1	96	4·7
200	70	3·3	85	3·3	91	3·5	91	4·3	92	4·9
300	59	3·7	81	3·5	88	3·6	86	4·5	87	5·2
400	53	4·2	76	3·8	84	3·7	81	4·7	82	5·4

1,100	36	5·7	53	6·0	62	5·4	58	6·5	58	7·1
1,200	35	5·8	50	6·3	59	5·6	46	6·7	56	7·1

Professor S. P. Thompson has prepared the following table to show the effect of an increase or decrease of voltage on the life and light of a 10c.p. lamp made for working on a 100-volt circuit:—

TABLE OF AVERAGE CANDLE-POWER AND EFFICIENCY OF LAMPS AT DIFFERENT PERIODS OF THEIR LIVES.

Volts	95	96	97	98	99	100	101	102	103	104	105
Life	3,595	2,751	2,135	1,645	1,277	1,000	785	601	477	375	284
Candle-power.	7·4	7·8	8·3	8·8	9·3	10	10·7	11·3	12	12·6	13·3

High-Voltage Lamps.—In the articles on distribution we frequently referred to the advantages of high-pressure distribution, and when we remember that higher voltages facilitate a large supply from one centre, and consequently tends to lower the cost by spreading the nearly fixed charges, we can readily understand why central-station engineers have introduced high-voltage lamps in consumers' premises, and have produced a demand for such lamps. It is equally obvious that there will be mechanical difficulties in the construction of these lamps, and that the manufacturers must experience practical difficulties in disposing the long filaments of the high-voltage lamps in bulbs of the same size as used for lower voltages. By high-voltage lamps is meant lamps requiring pressures varying from 200 to 230 volts, and for the same candle-power it is clear that the filaments of these lamps will be long and of small cross-sectional area, as compared with the shorter and thicker filaments of the 100-volt lamps. To give some idea of the dimensions of the new filaments, we may state that for a 230-volt 16c.p. lamp the filament is about 14 or 15in. in length, and $\frac{2}{100}$th of an inch in diameter, and forms, in fact, a very flexible pendulum. Not only is there the difficulty of disposing these long, thin filaments in a small space; but the disturbing effects of gravity and electrostatic charges on the bulbs have also to be taken into account, in consequence of which most of the high-voltage lamps are unsuitable for burning in any but a vertical position, the cap being uppermost. In the inclined or horizontal positions there is a great tendency for the filament to drop on to the bulb and to crack it, because of its great length. Furthermore, with the higher voltages the electrostatic attractions are much greater, and, as a result, the filaments tend to approach the bulb.

Broadly speaking, high-voltage lamps may be divided into two classes—double filament lamps and single filament lamps—examples of which are shown in Fig. 85. With the double filament lamps the filaments may be in the same plane or in parallel planes, and in some cases the filaments are shackled to the glass. Shackling, however, possesses two great disadvantages: (1) In consequence of the frequent expansions and contractions, there is the liability of air-leakage being produced, and (2) the shackles may cut the filaments. Of course, with the double filaments there is improved rigidity.

With the single-filament lamps the filaments may be formed into convolutions, or be made wavy, zigzag, or sinuous. To diminish the length, many attempts have been made to use filaments of increased specific resistance or unflashed filaments; but flashed filaments are preferred, in consequence of their longer life, and, so far, the zigzag form gives the best results.

The Distribution of Light.—The amount of light received by a body per unit of area is known as the "illumination," or the intensity of incident light; and, generally, the illumination may be taken as being inversely proportional to the square of the distance from the illuminating body. For purposes of reference, 2 units of illumination have been used—*i.e.*, the *candle-foot* and the *carcel-mètre*. The *candle-foot* is the intensity of illumination of 1c.p. at 1ft., or 4c.p. at 2ft., and generally illumination is proportional to illuminating power, and inversely as the square of the distance.

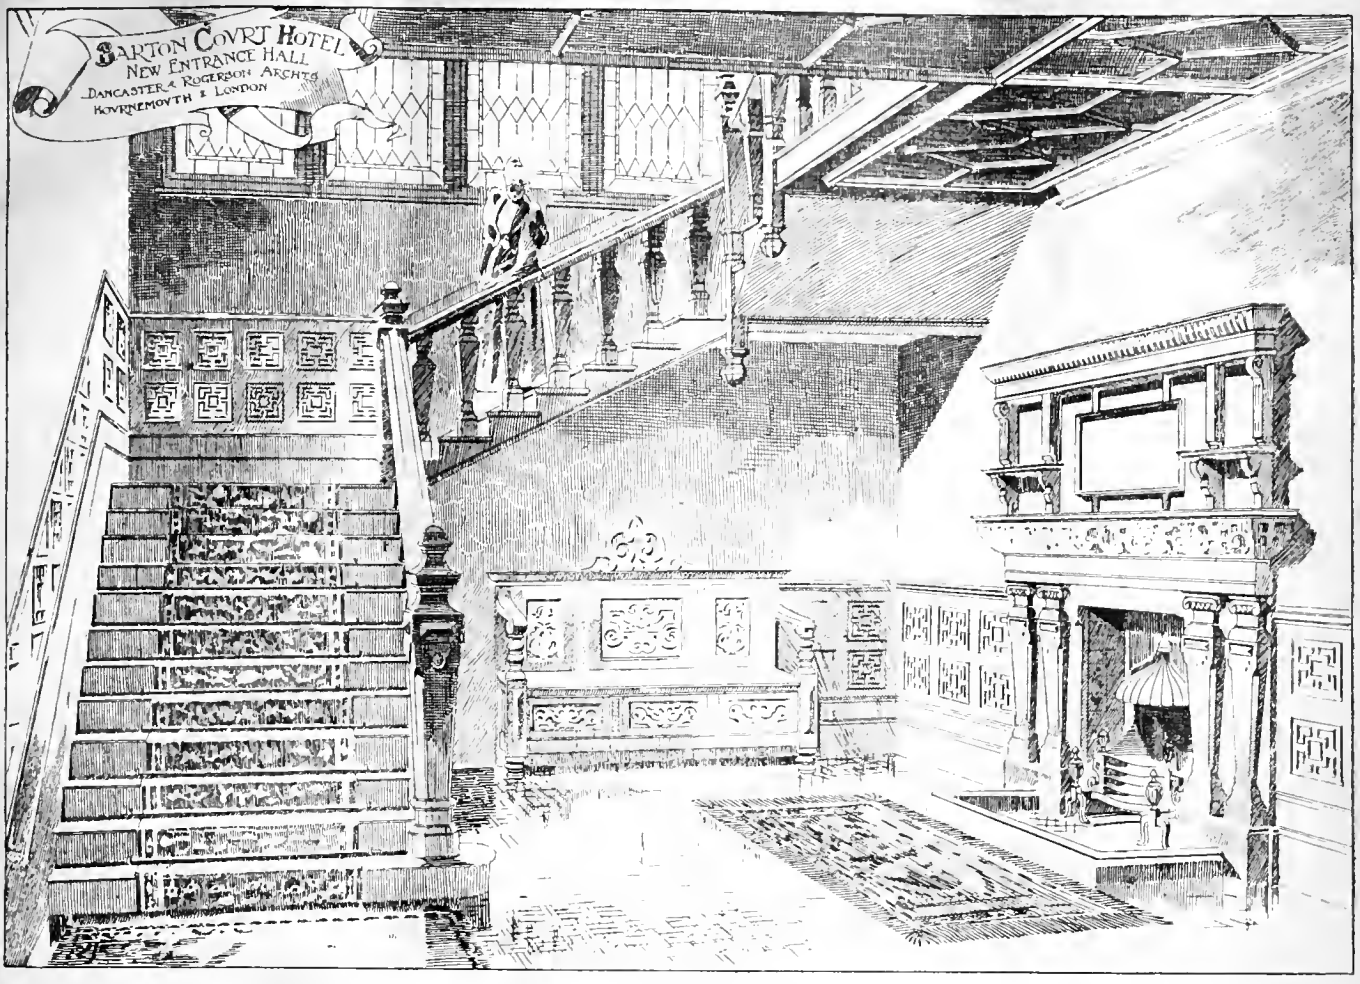
$$\therefore \text{Illumination} = \frac{\text{c.p.}}{(\text{feet})^2}.$$

One *carcel-mètre* is the amount of illumination of one carcel at a distance of one mètre, and one carcel-mètre = 0·883 candle-foot. The illumination of a horizontal plane varies as the cube of the cosine of the angle of incidence. The candle-foot is a comfortable illumination for reading purposes, whilst about half of this is suitable for ordinary purposes. But the requisite illumination of a room depends upon the character of the interior surfaces and the dimensions of the room. Dark walls require more illumination than highly diffusive wall surface to produce the same general degree of illumination. According to Dr. Sumpner, dull walls only reflect about 20 per cent. of the light incident upon them, whilst ordinary tints reflect 40 to 50 per cent., clean white surfaces 80 per cent., ordinary mirrors 80 per cent., and very good mirrors 90 per cent. Hence, well-whitened rooms require only one-fifth of the light required with dull walls. The height of the room also has to be taken into account, and it is found that one-third candle-power to the square foot of floor space amply illuminates a room for reading purposes. This is equivalent to one 16c.p. lamp for every 50sq.ft of floor space; and a useful rule is to place 16c.p. lamps 8ft. high, in which they light a circle 8ft. in diameter.

Advantages of Incandescent Electric-Lighting.—(1) Glow-lamps are capable of affording a uniform character of illumination free from sharply-marked regions of light and shade, since the light can be readily divided. (2) They are capable of affording an agreeable and steady illumination, entirely free from disagreeable flickering. (3) They are free from noxious fumes, and produce less heating than would an equal amount of gas or oil light. One 16c.p. gas-burner vitiates the air to about the same extent as 12 adult persons; one 16c.p. glow-lamp does not vitiate any air, and gives only one-fifth of the amount of heat produced by a 16c.p. gas-jet. (4) Glow-lamps are much safer than a naked gas-flame, since it is placed in a closed chamber, and does not require to be lighted by matches. In the event of a fracture of the glass chamber, the globe is collapsed, and not exploded.

(*To be continued.*)

A large gang of men have commenced the enlargement of the Rhyl Railway Station. Six new sets of rails have been laid on the Vale-road side of the station for the goods traffic. This is also the site of the new goods offices. The Vale-road bridge will be considerably lengthened. The Holyhead platform will be transformed into an island platform, and the present goods sidings will be used for passenger trains. A new exit has been made on the Chester platform.



NEW ENTRANCE HALL, BARTON COURT HOTEL, NEW MILTON, HANTS.

THE staircase hall of the new wing to the above hotel, of which we now publish an illustration, will be built at the west end of the present building. We illustrated the new dining-hall of the hotel in an issue of April 29. It having been thought desirable to introduce fire-proof material for the stairs, it has been decided to construct the steps of patent Victoria stone, which will be well bedded into walls and supported by steel girders. The massive moulded and carved newels and balusters will be of solid oak, well dowelled and secured to the Victoria-stone steps. The windows for the entire height will be the full width of the staircase, and filled in with Messrs. Seward and Co.'s lead lights and tinted cathedral glass to design. The chimney-piece and overmantel, which has been specially designed by the architect, will be of carved black oak. The ceiling will have moulded ribs set out in pattern. The architects are Messrs. Dancaster and Rogerson, of Bournemouth and London.

ROYAL ARCHITECTURAL MUSEUM.

THE annual general meeting of the supporters of the Royal Architectural Museum and Westminster School of Art was held in the hall of the Museum, Tufton-street, Dean's-yard, S.W., on Friday afternoon, the chair being occupied by the Duke of Westminster, K.G., President of the institution. The hon. secretary, Mr. Maurice B. Adams, produced a number of letters from persons unable to be present, including one from Dean Bradley, who excused his attendance owing to the fact that he had arranged to conduct a party of workmen over the Abbey at the same time as the meeting in Tufton-street was in progress. Mr. Alfred Waterhouse, R.A., who had promised to be present, telegraphed his apologies for not coming, being prevented at the last moment. Sir Arthur Blomfield, A.R.A., proposed the re-election of the Duke of Westminster, K.G., as President, and the following noblemen and gentlemen as vice-presidents:—The Duke of Norfolk, the Duke of Rutland, the Marquess of Ripon, the Marquess of Bute, Earl Fortescue, the Earl of Wemyss, Lord Grimthorpe, Sir H. W. Peek, and Mr. Walter Carew Cocks.

Sir Arthur Blomfield alluded to the continued prosperity of the Institution, and warmly referred to the success and usefulness of its work and classes. Mr. J. Hungerford Pollen, in seconding the motion, enlarged upon the change of taste observable in contemporary building as compared with the in-some-ways sterner productions of the Gothic Revival, with which the founding of the museum was so intimately associated. Mr. Pollen referred to the personal interest always displayed by the Duke of Westminster in furthering Gothic architecture, and indicated the fact of Eaton Hall being designed in that manner, as an instance of the application of the Mediæval style to modern uses practically and cleverly realised.

In returning thanks, the chairman said he feared there was some truth in Mr. Pollen's complaint that London was being spoiled by a jumble of architectural fashions, due, perhaps, to the modern tendency to eclecticism. He had not been guiltless in this respect; but, according to his lights, he had endeavoured to retain something of the grand old style in some of the houses he had caused to be built for himself. It was true that London smoke ruined everything, though good red brick and stone, after all, proved the best material available; but even the smoke did not justify the use of cement, which was now too frequently employed, with its periodical paintings, and which, of all architectural abominations, was the worst. With regard to the rebuilding which had of late years been carried on more closely under his control in the West of London, the Duke ventured, he said, to assert that whatever faults might be named as belonging to the façades thus put up, they were, at any rate, a vast improvement upon what was there before, and, as an example, the rebuilding of Mount-street, Grosvenor-square, was mentioned as being picturesque, and far brighter than the dismal old fronts which not long ago disfigured that thoroughfare.

The report of the council was read by Mr. Francis Ford, Curator. It referred with regret to the loss the museum has sustained by the death of three of the oldest subscribers—Lord Leighton, Mr. J. L. Pearson, and Sir Thomas Dyke Acland. The earnest and enthusiastic band of men who, in their love for Gothic architecture in its best and purest forms, founded and maintained the museum in its earlier years, is indeed fast diminishing, and at present there is no sign of the ranks being filled up either by members of the architectural profession, or by the general public. The council, however, are confident that the superb collection of examples committed to their charge, and preserved intact for nearly half a century, will, in course of time, meet with renewed appreciation and pecuniary support. During the past year it has been found possible to make, at a very considerable outlay, an addition to the accommodation required for the School of Art, and incidentally to free the central hall of the Museum from studies which were to some extent out of harmony with their surroundings. The new buildings have been completed and partially occupied, and are now being equipped and fitted with the electric light. Four classrooms have thus been added to the accommodation devoted to the school. At last year's examinations, in the most advanced subject of all—viz., drawing from the life, 61 candidates were presented from this school, of whom 22 obtained second-class certificates, 29 first-class certificates, and 8 "excellent" (the highest award), there being only 2 failures. The contract for the new classrooms, which have been built by Messrs. Lathey Bros., from the designs of Messrs. Lee and Pain, architects, was £2,322, and the extras were so few that this amount has only been exceeded by £21 0s. 8d., bringing the total to £2,343 0s. 8d. The building is heated by hot-water apparatus, fitted by Messrs. Haden and Sons, at a cost of £219 14s. 4d. The installation of the electric light will involve an outlay of about £50, and other expenses connected with the building, compensation for disturbance, &c., amount to about £25. The architects' fees amount to £166 6s.; but Messrs. Lee and Pain have generously returned £66 as a donation towards the cost of the building, for the equipment of which the Technical Education Board of the London County Council has voted £250. The total expenditure on the new building, including consequent work in the removing and rehanging of casts in the museum, is thus brought to a total of about £2,850, of which, up to the present date, about £2,600 has been paid. The favourable

condition of the finances is mainly due to the success of the School of Art, which thus repays in its prosperity the expenditure necessary to its maintenance during its earlier days, when it owed its establishment and existence to the fostering care of the museum.

The adoption of the report was moved by Mr. Aston Webb, F.S.A., who reported that it was of an exceptionally satisfactory character. The help afforded by subscribers, £466, was so small relatively, that the institution might be regarded as practically self-supporting; at the same time, the council would be very glad to receive additions to the very small list of subscribers, not only as affording greater means of usefulness, but as evincing wider sympathy in their aims. The new classrooms were well arranged and excellently lighted, and he trusted that the small balance of £250 needed to defray the cost would be forthcoming during the ensuing year; and it should not be forgotten that the capital of the institution had been reduced to meet a portion of the outlay. A feature of the institution was that painters and sculptors had the opportunity of seeing the magnificent collection of architectural casts, and he felt glad that the students had these beautiful examples of past art ever before them. He had suggested that occasional lectures might be given in that hall on the collection, so as to awaken fresh interest in these treasures.

Mr. J. P. Seddon, Chairman of the School of Art Committee, seconded the motion, remarking that he felt that the unique collection of casts in that hall were not sufficiently appreciated by the present generation. He had recently been requested by the council to make a valuation of the casts for purposes of insurance, and found it difficult to put a sufficiently low estimate upon them. Were they destroyed, it would be impossible to replace them in most cases, and the loss to architects would be irreparable, for here the choicest carvings were brought together, and could be compared and studied in a better light and at closer quarters than was possible in the case of the originals. It was to be wished that architects having charge of historic buildings would follow the example of the late Sir Gilbert Scott, and have casts made of typical features as opportunities afforded. During the last decade they had had no additions to their collections.

The report was adopted unanimously.

Mr. C. Forster Hayward, F.S.A., moved the re-election of the council as follows:—Earl Wemyss and Walter Carew Cocks, vice-presidents; and Messrs. C. F. Hayward, Sydney W. Lee, William Pain, J. Hungerford Pollen, J. P. Seddon, and Aston Webb, and Messrs. L. H. Hayter, W. R. Lethaby, and Dr. Garnett, the three last-named being the representatives of the London County Council. He also proposed the re-election of Mr. E. L. Somers-Cocks as hon. treasurer, and Messrs. W. Pain and P. D. Leake as auditors. This was seconded by Mr. Lee and carried unanimously; and a vote of thanks to the Duke of Westminster for occupying the chair, proposed by Mr. Pain, closed the proceedings, after which an inspection was made of the new classrooms.

IRONWORK AT SOUTH KENSINGTON MUSEUM.—VI.

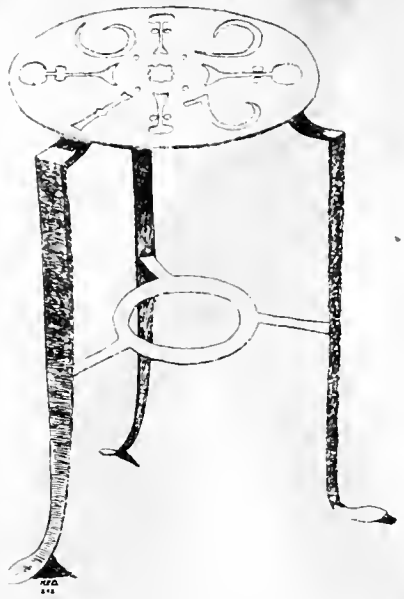
By G. A. T. Middleton.

VII.—ENGLISH: TWO SEVENTEENTH-CENTURY TRIVETS.

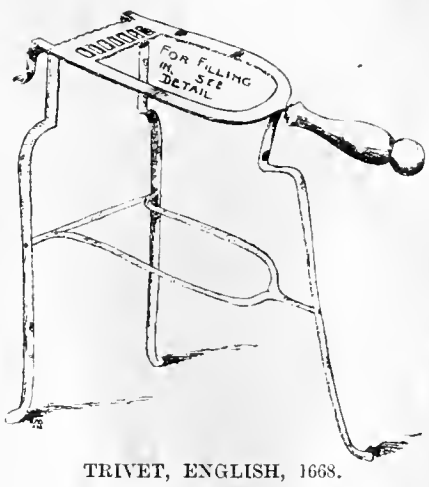
EXCEPT to draw attention to the effectiveness of their simple design, executed without apparent attempt at mechanical precision, there is little to say about these trivets. The top is the only enriched portion of either—and that is of pierced metal—the ornament in one instance being in the form of a debased anthemion, and in the other consisting of the date.

DECORATION OF FURNITURE AND WOODENWARE.

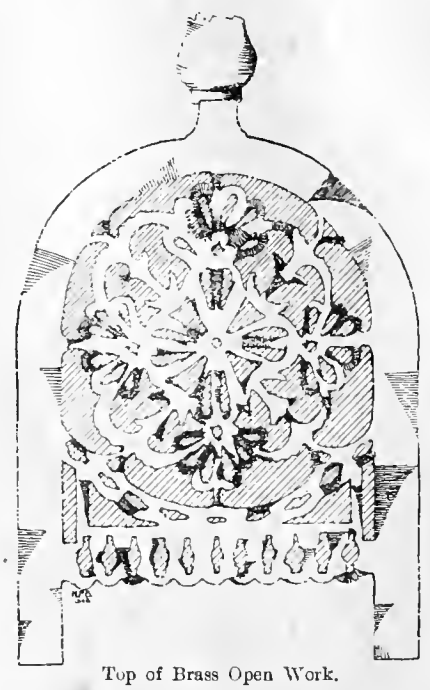
L. G. ANDES gives, in the *Zeitschrift für Drechsler*, some directions on this subject. In order to produce coloured decorations on wood, the wooden plates are treated with hydrochloric acid, which renders the surface of the wood porous. The figures are then pressed in with an engraved plate and strong pressure, and the whole plate is polished off smooth with pumice stone. When the wooden surface is subsequently coated with a colour solution, a handsome design will result, because the pressed and denser places take up less colour, thus showing a lighter tone of the same colour than the places not pressed.



WROUGHT-IRON TRIVET, 1692.



TRIVET, ENGLISH, 1668.
(Brass Open Work on Iron Stand.)



Top of Brass Open Work.

For preserving varnished and stained woodenware, the following process is recommended: The lye, prepared from 3 parts potash, 1 part calcined tartar, and 24 parts water, and thinned with 48 parts water, is spread out uniformly to prevent the formation of spots. After three to four minutes' action, the lye will have dissolved the dirt, and rinsing off with water should follow. It is also advisable to clean varnished articles with olive-oil. Flour, hair-powder, or prepared white hartshorn is dusted on the applied olive-oil, and the olive-oil is rubbed off again with a soft rag. By this means not only the dust and spots are removed, but the gloss of the furniture is restored at the same time.

The following process is said to be well adapted for the production of black, faintly lustrous polished surfaces:—Plane the surface smooth and clean it nicely, stain with a strong decoction of logwood chips, and after this coating is half dry, finish staining with iron liquor (iron pyrolignite); allow the resulting black colouring to dry well, and rub down the raised grain carefully. If light places appear in consequence of the rubbing, stain them black again. After the last rubbing with pumicestone and oil, polish the surface with pale shellac polish in which some aniline black has been dissolved, or dissolve the aniline black in the alcohol necessary for rubbing down, and finish colouring in this manner. When the polished surface has become dry, rub it down with burnt pumicestone and water, using a piece of hat felt, remove the mass entirely, and give the surface a dull lustre by treatment with wax salve.

DISTRICT SURVEYORS' ASSOCIATION DINNER.

THE district surveyors of London dined together at the Café Royal, Regent-street, on Tuesday, the 14th inst. The chair was taken by Mr. Horace Gundry, F.R.I.B.A., the president, and he was supported by the members of the tribunal of appeal, Mr. Arthur Cates, Mr. A. A. Hudson, and Mr. G. W. Penfold, two members of the L.C.C., Mr. R. A. Robinson and Mr. H. A. Harben, while Parliament was represented by Sir George Fardell, M.P. Other visitors were Mr. J. Hebb, Mr. G. W. Thomas, and Mr. J. W. Godfrey, who attended with their chief, Mr. Thos. Blashill, superintending architect, and Mr. B. Hayward, son of Mr. C. F. Hayward. The R.I.B.A. was represented by Mr. W. Emerson, hon. sec., and the law by Mr. T. Wheeler, Q.C., and Mr. A. Collins, and Mr. J. Andrews was the guest of the vice-president. The following district surveyors were present:—Messrs. L. Tabberer, V.P., H. H. Collins, C. F. Hayward, F. Wallen, G. Elkington, A. W. Tanner, E. Marsland, W. H. Lees, R. P. Motley, Alex. Payne, A. Conder, Walter Spiers, H. Cheston, H. W. Stock, Henry Lovegrove, A. Williams, Geo. McDonell, E. Carritt, and A. Crow. The usual toasts were honoured, and the musical arrangements were under the direction of Mr. G. F. Smith, of Brixton. The toast of "The Houses of Parliament" was proposed by the President, and was responded to by Sir Geo. Fardell, M.P. "The London County Council," by Mr. C. Forster Hayward, responded to by Messrs. Harben and Robinson. "The District Surveyors' Association," by Mr. A. A. Hudson, responded to by Mr. Horace Gundry, President. "The Tribunal of Appeal," by Mr. H. H. Collins, responded to by Mr. A. Cates. "The Officers of the County Council," by Mr. T. Wheeler, Q.C., responded to by Mr. T. Blashill. "The Vice-President and Officers," by Mr. G. Elkington, responded to by Mr. Tabberer. "The Visitors," by Mr. H. Lovegrove, responded to by Mr. W. Emerson.

COST OF PILE-DRIVING WITH THE STEAM-HAMMER.*

MANY formulas have been given at various times, by experts, to determine the cost of driving piles with the drop-hammer, under various conditions and into different soils, but experience has proved them to be very unreliable. This being the case with an old and universally used machine, it must be considered a problem of the future to suggest formulas for the cost of driving piles with the steam-hammer. While the writer does not claim that the steam-hammer will drive piles more cheaply under all conditions than will a drop-hammer, still where the two have been operated at the same time

* A paper by E. N. Pagelsen read before the Engineering Association of the South (U.S.A.) and published in the *Papers* of the Association.

under similar conditions the former has been the more economical. No cases to the contrary have been reported where the modern machine has been used. Its greater first cost is of course a large factor to be considered, and often prohibits its use where it otherwise would be selected. A very good example of the work of the two kinds of machines is that done in the driving of piles for the foundation of a large gas-holder in New York City. With a 2,500lb. drop-hammer, four piles were all that could be driven in a day of ten hours, while a steam-hammer drove thirteen. They were each 70ft. long, 8in. in diameter at the point, and 15in. at the head. A total of 800 were driven, at a cost of two dollars each. In New York Harbour the drop-hammer drove fifteen piles per day of ten hours, often breaking or otherwise damaging them, while the steam-hammer averaged from 40 to 45 without damage. The piles were 50ft. long, driven 21ft. to 26ft. into gravel and hard-pan. A total of 1,800 were driven, at a cost of 80 cents each. In Puget Sound the steam-hammer averaged nearly 200 piles per day where the drop-hammer could not put in over one-fifth that number, and even then many were damaged. The same crew did the work with both. These piles are 100ft. long, of Oregon fir, measuring but 8in. in diameter at the point, and are driven butt end down for strength. They are used in the fishing industry. In this case the heavy blow of the drop-hammer caused the pile to spring sidewise, often to split, while the many lighter blows of the steam-hammer jarred the piles down. In the following cases no comparison can be made directly, but engineers can recall instances in their own experience which may be used. In Chicago, 40 Norway pine piles were driven 45ft. deep every ten hours at a cost of 55 cents each. Another firm drove from 60 to 65 piles, each 45ft. long, 15ft. deep into hard sand each day at a cost of about 30 cents each. In both cases they were driven for foundations. A New Orleans firm reports the cost of driving 6,000 piles for wharf construction with a floating driver during three months as follows :—

	Aug.	Sept.	Oct.
Average number per hour	3·05	4·34	3·7
Average length per pile in feet	70	68	73
Average cost per pile-driving in dollars.	1·70	1·14	1·28

The same firm used the same hammer for driving bents for a railroad trestle. The driver moved forward on the bents as fast as they were capped. The rate was 11 bents per day, piles varying from 20ft. to 45ft., and driven 15ft. deep. Total number of bents was 141, and four piles to a bent were driven at an average cost of 85 cents each. The hammer moved in pendulum leaders, driving the piles at quite an angle. The hammers used in the above cases were made by a local firm, and, with one exception, were of the following dimensions :—Total weight, 9,000lb. ; weight of striking ram, 4,800lb. ; stroke, 42in., and about 60 blows per minute ; the coal consumption is about 2,500lb. per ten hours. The engineer can do his own firing. The crew needed is the same as for a drop-hammer. The hammer used on Puget Sound was somewhat lighter :—Total weight, 6,100lb. ; weight of ram, 3,000lb. ; stroke, 30in., and about 70 blows per minute. The parties using this hammer claim that the blows are somewhat too heavy for the long piles, and advise a lighter and much faster hammer. It seems that in this case in particular, the short interval between the blows does not give the soil time to settle around the pile, which is prime advantage in using the steam-hammer.

BOOKS RECEIVED.

Party Structure, by Sydney Perks, A.R.I.B.A., &c. (London: The St. Bride's Press, Ltd., Bride-lane, Fleet-street) is a useful little epitome of Part VIII. of the London Building Act, 1894, in which the author deals with various questions and decisions under this part of the Act. Mr. Perks points out important differences between the old and new Act. The building owner has now power to underpin (sections 88, 1, and 6). The case of "The Standard Bank of South Africa v. Stokes" establishes this right. He has also power to cut away other projections besides chimney breasts, jambs, or flues from external as well as party-walls, a right to raise a party fence wall, or pull down and rebuild it as a party-wall (sub-section 12). In the old Act no mention was made of a fence wall. There are, however, restrictions as to time, proper notice (14 days), consent of owners and occupiers, shoring up, and hoarding (section 90). The adjoining owner has to pay a proportion of the cost of raising or underpinning walls if he uses them. Several leading cases are referred to, as "Weston v. Arnold," "Knight v. Pursell," "Drury v. Army and Navy Stores," a recent and important decision, in which it was held there was no presumption that a wall which was a party-wall as to a portion of its height, should be a party-wall as to its whole height. Referring to this last case, Mr. Perks remarks that those who framed the Act did not contemplate openings in ordinary or technical party-walls. The Act is perfect under the supposition that there was no intention to allow openings, not otherwise. The author says the majority of district surveyors would not accept this case as conclusive. The reasoning seems sound by which he establishes this view. Till the decision has been reviewed by the High Court it is likely surveyors will abide by it, however unsatisfactory. Many other important points are discussed, as the mode of procedure in party-structure cases. The author mentions objections to the form of the R.I.B.A. notice which appear sound. Sect. 88, as to building owners' rights of raising and underpinning external walls and party-walls and other sections are commented on. The text of the Act and schedules are given.——*Manual Training Woodwork*, a handbook for teachers, by George Ricks, B.Sc.Lond., Inspector of Schools, &c. (London: Macmillan and Co., Ltd.), embodies the results of experience in the training of hand and eye in the working in wood with carpenter's tools. The book has been written for teachers. Mr. Ricks enumerates certain principles in the attainment of this object: (*a*) Drawing is made the fundamental basis and integral part of the whole scheme, and working drawings to scale is made for every piece of work. Every piece of wood must be lined-out before being cut. (*b*) The material selected must be such as will facilitate neat and accurate workmanship, and suitable tools be used. (*c*) The pupil must acquire an intelligent knowledge of the various woods he works on, and of his tools. (*d*) The exercises must excite interest, and be carefully graduated, proceeding by easy steps from the simple to the complex. The principles of projection or the drawing of plans, elevations, and sections, is first dealt with, and illustrated by large and clear diagrams, which will easily be understood by teachers and pupils. These are all drawn to scale. The subject of planes as illustrating the making of plan and elevation is popularly explained; after which rectangular prisms—as cubes—are given as another exercise. These are built up to form an object. Cardboard or thin batten is the material suggested. To assist the pupil's eye in the instruction, isometric projection is used, and this mode of drawing solid objects is explained by simple diagrams. The chapter on timber and its structure is well illustrated by sections of different kinds of timber, and the processes of seasoning and shrinkage are clearly described. Next, tools and other appliances are enumerated and illustrated. The graduated exercises are well selected, and are arranged to avoid waste of material. Very simple exercises like cutting a certain size piece of board; setting-out, sawing, and planing a prism; chamfering it; horizontal chiselling of different kinds, from simple to oblique; sawing and planing-up geometrical figures, and parquetry work lead up to exercises of a more complex and constructive kind—making boxes in which "housing" and nailing are required, half-lap joints, mortising and tenoning, dovetailing, and other kinds of jointing. Carved work and mouldings come into these more advanced exercises. As a useful manual for the teacher of our technical and board schools, we can recommend this handbook.——*The Present Position of the Sewage Purification Problem*, by H. Gilbert Whyatt, Assoc.M.Inst.C.E., &c., Deputy Borough Engineer, Salford (London: The Westminster Press, Regency-square, S.W., is a small *brochure* dealing with this question. The author discusses the position taken up by the Local Government Board, the discoveries of late years as to the purification of sewage by means of micro-organisms in bacterial filters, and, lastly, the description of the more noted of these systems. Mr. Whyatt speaks of the Salford experiments on purification, which have been carried on for ten years, much time having been spent upon various patented chemical processes, but all failures. Five years ago Mr. Joseph Corbett, the borough engineer, proposed artificial filters, and experiments were made. A set of six filters were arranged at three heights, with a ventilation floor between each of 20in. of filtering material: two were composed of gravel and sand, two of coke breeze, and two of cinders; the cinders proved the best filtering media. The results were good. The advantages of a preliminary "roughing" filter were proved. The filters were altered to have two, three, or four stories, and thus have different degrees of ventilation, and this experiment is being continued. A record of the effluents from each filter has been kept, but no practical difference has been found. The use of wooden troughs to deliver the effluent at 2ft. or so above the top has been found more successful than troughs imbedded in the filters. So long as the filters do not choke up by a glutinous mass of bacteria, the quality of the effluent is good; to clear the filter material it is only necessary to leave the filter idle for a week or two to recover its aëration and take the sewage. A week's rest starves the bacterial population out of existence, and the filter recovers its efficiency. We cannot give all the facts; the Salford Corporation consider the system so satisfactory that they have resolved to spend £80,000 in laying down bacterial filters: but the Local Government Board have refused to sanction the expenditure unless the Corporation include a sum to cover the purchase of a sufficient quantity of land over which the filter effluent may be turned. The author says the time has arrived when the Local Government Board should be aroused from its agnostical state and undertake an examination of bacterial filters which have proved so successful. Wimbledon, Wolverhampton, Yeovil, Lichfield, Buxton, Leeds, Oldham, and Manchester have all tried experiments, and, according to the author, the results have been satisfactory. We recommend all authorities and borough engineers to peruse this little book.——We have received from Sir John Leng and Co., Dundee, the attractive Summer Number of the *People's Journal*, which contains much that will interest holiday readers, including nine well-written stories, and the usual prize letters, essays, and sketches.——*St. Martin's Church, Canterbury.*—This is the first of a set of books on well-known churches, published by Messrs. George Bell and Co., London, uniform in size and style of ornamental cloth binding, with their excellent Cathedral Series, of which we have reviewed the eleven volumes already published. The Church series are, however, to be navy blue instead of pea-green in colour. No parochial building of greater historic interest exists than St. Martin's, Canterbury, and the publishers have secured a well-qualified guide to pen its story in Canon Routledge, who mentions in his preface that during recent explorations so much fresh matter has been brought to light that it has become almost necessary to re-write the structural description of the building, and to reconsider the date of its erection. The author gives structural evidence to justify his guarded belief that it is "more than probable" that parts of the original structure mentioned by Bede are standing, and that the present walls were not only consecrated by the memory of St. Augustine, but may be traced back to a considerably earlier period. The little monograph, which is clearly and brightly written, is illustrated by plans and some four-and-twenty engravings, several of these showing the early work recently discovered in the church.——*Smith's Law of Master and Servant* (London: Effingham Wilson). A new edition of this well-known handbook on the legal relations between employer and employed, edited by Mr. G. E. Emery, LL.B., barrister, has just been published. It contains a new chapter dealing with the Workmen's Compensation Act, 1897, which comes into operation, as our readers are aware, on Friday, the first of next month; but some necessary corrections have been made in the text of the earlier portion of the work. An appendix deals with the Conciliation Act of 1896.——*Calculation in Hydraulic Engineering.*—A practical textbook for the use of students, &c., by T. Claxton Fidler, M.Inst.C.E., Professor of Engineering. Part I. (London: Longmans, Green, and Co.) ought to be a very useful handbook for engineers, students, assistants, and draughtsmen engaged in making hydraulic calculations in connection with engineering works of this kind. Mr. Claxton Fidler does not pretend to write a treatise on hydraulics, but rather to apply principles; and his introductory remarks on fluid pressure in Chapter I. are clear, and will much simplify the conception of such pressure as the engineer understands it—such, for example, as the practical exemplification that

the engineer is more likely to understand the theory of fluid pressure, if applied to a square box filled with high-pressure steam or fluid, which acts upon each side of the box at right angles to the plane of boundary, or to the bottom and lid, and to each side of box, than if he were informed in the language of theory that the pressure acts equally in all directions at any point in the internal mass of the fluid. The articles on fluid pressure of uniform intensity are explicitly penned. As regards fluids, we are reminded that they have weight, and so it is not true to say a fluid pressure is of uniform intensity, but for practical purposes it may be assumed to be uniform. Thus if a cubical box be charged with water under a pressure, the pressure downwards will be greater than that upwards by the weight of the water, or 624lb. if the box measures 12in. on each side. But in practice this weight is not worth considering. The chapter on cylinders, pipes, bends under uniform pressure, is an important one for engineers, as it considers the effect of unbalanced internal forces in pipes with bends, and the axial stress caused by the fluid, the transverse strength of pipes, the buckling of straight pipes, the strength of joints necessary, expansion joints, hydrostatic pressure, floating vessels, &c., are discussed in terms of simple mathematics. Such practical questions as the pressure upon vertical walls of irregular figure, and upon inclined and curved surfaces like walls are considered, and the examples, with practical calculations, are very useful.

CHIPS.

The Prince of Wales will lay on Saturday, July 2, the foundation-stone of new buildings in Creek-road Deptford.

The new Metropolitan Tabernacle is to be rebuilt on almost the same plan as the burnt church; but the upper gallery will be omitted and the exits widened.

Ornithology and entomology have sustained a great loss by the death of Mr. Osbert Salvin, F.R.S., which occurred last week at his residence, Hawksfold, near Haslemere. He was the second and only surviving son of the late Mr. Anthony Salvin, the well-known architect.

The foundation-stone of a temporary church in Salisbury-road, Redlands, Bristol, was laid last week. The building, which will eventually be used as a parish-hall to the permanent church, will be 108ft. long and 36ft. wide, the roof rising to a height of 50ft. The chancel and sanctuary at the east end are to be approached by a few steps. There will be a porch on the north-west side. The building, which is to be constructed of Pennant stone, will be Gothic in style, the open roof being of pitch pine and covered with Brossley tiles. The builder is Mr. Vowles, of Elton-road, Bristol, and Messrs. P. Munro and Son are the architects.

The Bishop of London has fixed Friday, July 1, for the consecration of the new Church of St. Peter, Hornsey, built from the designs of Messrs. James Brooks and Son. About £2,000 is still required, the total cost of the nave and aisles being nearly £8,000.

The old parish church at Bothwell, N.B., is about to be restored at the cost of some subscribers. The works will include a new organ and case to be placed in the west gallery, and fresh furnishings, comprising communion table and chairs, gas standard and sconces, and also of the chairs, table, press, and brackets for the sacristy. Intimation was also made of a gift of a stained-glass window, representing the Nativity of Christ, for the east end of the church. The sketch has been prepared by Sir Edward Burne Jones, and the work is to be executed by Messrs. William Morris and Co., of London.

The Great Northern and City Railway undertaking, which, on its introduction four years ago, failed to receive any substantial measure of support, is again to be brought before the investing public. The line will run from Finsbury Park to Moorgate-street, and will have intermediate stations at Drayton-park, Essex-road, and Old-street. The share capital is to be £1,560,000, and the directors anticipate that the railway will earn a minimum annual income of £81,500, whereas to pay the debenture interest and preferred dividend only requires £52,000.

The rector of Hawarden, the Rev. Stephen Gladstone, has adopted plans by Mr. J. Douglas, of Chester, for the erection of a district church at Sholton. It is proposed to build a nave with clerestory, a chancel and apse, a north aisle and porch, and to leave the tower and south aisle for others hereafter to complete. The present expenditure is estimated at £3,000.

Engineering Notes.

DUNOON.—The ceremony of opening the new pier has been performed by Lord and Lady Malcolm of Poltalloch. The old pier at Dunoon belonged in former years to the Hafton Trustees, but was purchased by the commissioners for £27,000. The commissioners decided to renovate and extend the structure—a work entered upon two years ago. It was resolved to incorporate the old pier with the new structure, and to utilise the old gangway for goods and luggage traffic, providing a new gangway for passengers. The pier-head is now 410ft. long by 60ft. wide, and the new gangway is 170ft. by 40ft. The structure is of timber, secured by iron bolts, and sheathed in places with iron plating. The depth of water is 10ft. at low tide, and 20ft. at high tide. On the pier waiting-rooms have been erected, while at the shore-end stand the administrative offices, surmounted by a clock-tower. A covered verandah runs the whole length of the waiting-rooms, fronting the sea, and the signal-box is placed at the sea end of the new gangway, with a belfry above, in which a fog-bell has been hung. The pier and rooms will be lit at night with electricity. In addition to the pier, the works include a sea-wall about 300 yards in length, formed of rubble concrete, and surmounted by an iron railing. A new road has also been constructed, at a cost of over £3,000, through the hillock known as Tom-na-hhoid. Mr. W. R. Copland, Glasgow, was the engineer of the undertaking.

HERNE BAY.—A Press view of the Pier extension was given on Saturday. The old pier ran out to a length of only 400ft., and was left at low tide high and dry. It has now been lengthened by the addition of 3,320ft., making it the longest pier on the Kentish coast, and, as the head is constructed in deep water, steamers will in future be able to land passengers at any state of the tide. In the new structure there are eight alcoves, where the width is 30ft., and at two points the pier is widened to 66ft. The pierhead when completed will be 76ft. wide, and will carry an octagonal pavilion 40ft. wide. Beyond this there will be an independent timber landing-stage for the steamers. The pier is built on screw piles driven about 10ft. into the sea bed, the superstructure being of steel, with a wooden deck, which is 14ft. above the highest water. The total weight of steel and iron used is 1,600 tons. An electric tramway runs the whole length of the structure, which will be completed early in July. The sum expended on the pier has been about £20,000. Mr. E. Matheson is the engineer.

LANARKSHIRE AND AYRSHIRE RAILWAY.—At Lugton, Ayrshire, the Hon. Mrs. Greville Vernon cut recently the first sod of an extension of the Lanarkshire and Ayrshire Railway, which is to connect, by a direct and easy route, the port of Ardrossan with the coal and iron producing districts of Lanarkshire. Ten years ago the first portion of the company's line was opened from Barrmill to Ardrossan, with spur lines to Kilwinning, Saltcoats, and Irvine. This line gave a very much shorter route from Glasgow and Barrhead to the places named than had previously existed, but the trains had all to pass over some fifteen miles of the Kilmarnock Joint Line, including the very steep gradient of 1ft. in 67ft., continuing for nearly three miles, between Barrhead and Lugton. The extension now entered upon will avoid this gradient, and will also obviate the delays at present incurred by having to take the traffic over the congested lines in the neighbourhood of Glasgow. The new line commences with a junction near Barrmill with the company's present line, and will run into Lanarkshire through Lugton to Neilston and past Barrhead on the south-west on to Cathcart, Cambuslang, and Newton. Spur lines will connect with the Kilmarnock Joint Line at Lugton, and with the Caledonian Company's Busby line. As the steepest gradient on the new line will not be greater than 1 in a 100, every train can be run at full load. The railways comprised in the company's whole scheme are eleven in number, but several are merely loop or branch lines. In the aggregate they are 26 miles in length. The engineer of the line is Mr. Charles Forman (of Messrs. Formans and M'Call), and the contractors are Messrs. R. M'Alpine and Sons, who executed the earlier portions of the Company's undertakings.

LUMLEY CASTLE.—The Earl of Scarborough having decided to erect a bridge across the River Wear adjoining the existing ferry at Lumley Castle, instructed Messrs. D. Balfour and Son, civil engineers, of Newcastle, to prepare plans for a suitable structure, the contract for which has been let to Messrs. Head, Wrightson, and Co., of Stockton-on-Tees, who expect to start the work this month. The structure consists of a centre span of 120ft. and two side spans, each 37ft. long. The main and approach girders are to be of mild steel lattice-work, the bottom flanges being wind-braced, and the top flanges supported with struts and overhead arches. The flooring will consist of creosoted timber, with water-boards at each side. The piers will be each composed of four braced wrought-iron piles, formed of four segments riveted together, having cast-iron pile points, and driven 21ft. below river bed. Gates and turnstiles are to be fixed at end of bridge, and lighting arrangements to be provided. The structure is calculated to stand a safe distributed live load of 140lb. to the square foot, with four times this amount for the ultimate load.

WATERLOO AND CITY RAILWAY.—The opening of this underground electric railway will take place in the first week of July. The line is carried in two iron-bound tunnels, which have, as far as possible, been excavated under the public thoroughfares, and at one point only—near Stamford-street, Blackfriars—has it been necessary to make any arrangement with the owners of private property. The only stations are the terminal ones at Waterloo and at Bucklersbury. The platform of the Waterloo terminus, laid at a depth of 41ft. immediately underneath the principal main lines of the London and South-Western Railway, is approached by a series of inclined ways. After a sharp curve into York-road, the underground tunnels, rapidly descending, cross Waterloo Bridge-road, and follow the route of Stamford-street as far as Hatfield-street, where they turn in a north-easterly direction. Penetrating the bed of the Thames, they emerge on the Middlesex side of the river, in front of the Royal Hotel, and proceed under the centre of Queen Victoria-street to the City terminal station, which will eventually have an entrance to the public subway now in course of construction under the crossing in front of the Mansion House, the Royal Exchange, and the Bank of England. For the first, the City approach will be by two staircases near the premises of the National Safe Deposit Company in Queen Victoria-street. The railway works have been carried out by Messrs. Mowlem and Co., the engineers at the outset being Mr. W. R. Galbraith, M.I.C.E., and Mr. J. H. Greathead, M.I.C.E.; Mr. Harley H. Dalrymple-Hay, A.M.I.C.E., acting as resident engineer. Mr. Greathead died before the completion of the contract, and his place has since been taken by Professor A. B. W. Kennedy. Much of the tunnelling was executed in compressed air-locks, owing to the fact that the deep excavation had to be continued through a strata of water-bearing gravel. Where compressed air had not to be employed, the ordinary rate of progress was about 10ft. per day of completed work. The smallest diameter of the tunnels is 12ft. 2in. Electrical power is supplied from a generating station built close to the Waterloo end of the line. Therein are erected five boilers, engines, and dynamos, each of about 300H.P., and an evaporative condenser. The line is laid on the central conductor principle, the conductor being a channel-shaped steel rail, receiving an electric pressure of 500 volts. Five trains have already been ordered from the Jackson and Sharp Company, of Rochester, U.S., but six will be required to maintain the frequent service proposed. Each train consists of four coaches, the first and last being motor-cars. The ordinary carriages will seat 56 passengers, and the motor-coaches 46, the seating capacity of each train being for 204 passengers. Professor Kennedy has designed the electrical arrangements, and Messrs. Siemens Brothers and Co. have been the contractors for this part of the work, including the motors in the carriages.

The partnership heretofore subsisting between G. F. Lambert and J. C. Rees, of Neath and Bridgend, architects, under the style of Lambert and Rees, has been dissolved.

The Board of Trade has issued a provisional order to the urban district council of Barnes empowering them to supply electricity throughout the whole area within their jurisdiction, but excluding Hammersmith Bridge.

Building Intelligence.

BOURNEMOUTH. — The new chancel of the Bennett memorial church of St. Stephen was formally dedicated by the Bishop of Guildford on Friday. The whole interior of the church, which is Early English in style, is of Bath stone, with groined stone ceiling, and clustered columns and lofty arches of varying span. The new chancel is of apsidal shape, forming a pentagon, and north and south transepts, a choir, two vestries, and a small circular apsidal Lady-chapel on the north side have also been added, together with a stone organ-loft in the south transept. The apse is carried up on eight lofty columns which rise to the groining, and are tied at their centres and capitals to the outer wall by shorter arches, the lower ones being surmounted by a quatrefoiled parapet of pierced stonework. The intervening spaces between the bases of the columns and the outer wall form an ambulatory which is continued round the back of the altar. Each bay of the apsidal chancel has a lofty three-light clerestory window, the centre one being of stained glass. The diagonal ribs of the groin-work which terminate in a central ornamented boss or key-stone and those of the transepts and chapel are treated with dog-tooth moulding. The sedilia, credence, and piscina form one design, and occupy the three south bays of the chancel. The retable in the chancel is of red marble, and that in the Lady-chapel of alabaster. The reredos, which is of carved woodwork, takes the form of a triptych, the central subject being the Crucifixion, the wings containing figures of saints and angels, all carved in high relief and coloured and gilded. The length of the chancel and sanctuary from the nave is 50ft., and the length of the two transepts is 78ft. by 16ft. in width. The height from the floor to the groining of roof is 50ft. The first contract for the additions, which have just been completed, was about £10,000, but the extra work has reached an additional £2,000. Altogether, when completed, the church will have cost about £30,000. The builders are Messrs. Abbey and Co., of Salisbury. The architect of the first portion of the work was the late Mr. J. L. Pearson, R.A., and since his death his son, Mr. F. L. Pearson, has acted as architect. The foreman has been Mr. F. Chalk, and the clerk of the works, Mr. W. Harlow. The chancel and transepts are lighted by electricity, and it is intended to use the electric light in the nave at a later date. There have been many gifts to the church, including a carved oak altar-table made by Messrs. Drake, Limited, Bournemouth. The alabaster and marble retables are the work of Mr. Davidson, of London; the reredos is by Messrs. Moos Bros., of London: the sculptured figures and carving being by Mr. N. Hitch, of Harleyford-road, Vauxhall, S.W.

BRIDLINGTON.—The foundation-stone of the Grammar School was laid on Tuesday by Sir Charles Legard. The style is the scholastic type of the English Renaissance. The structure will be of red brick, with stone dressings and red-tiled roofs. The hall occupies the centre, and is 51ft. 6in. by 30ft., rising through the height of the two stories. It has an open-timbered roof, and is surmounted by a turret. On the west and south sides of the hall are four classrooms, which will afford accommodation for a hundred boys. On the north side space is left for additional rooms, which will be provided when funds permit. The principal entrance to the school will be beyond the classrooms on the east front, and the playground entrance will be on the west front. The head-master's house on the south side will have frontages to the east and south. Accommodation is provided for thirty boarders, with dining-hall on the ground floor and dormitories on the first floor. The buildings have been designed by Messrs. Botterill, Son, and Bilson, architects, of Hull, and the erection will be carried out by Messrs. John Thompson and Co., of Peterborough, at a cost of over £8,500. Mr. W. H. Williams is the clerk of works.

GLASGOW. — The corner-stone of the new Episcopal church and halls which are in the course of erection in Baltic-street, Bridgeton, Glasgow, was laid on Saturday. The new church, which is being erected to commemorate the thirteenth centenary of St. Columba, and will be named after that saint, is built in the Late Gothic style, and consists of a nave with a chancel and a south aisle. A morning chapel adjoins the chancel, and a mortuary chapel is at the south-west corner of the site. The large hall will accommodate between 300 and 400 persons, and there is also a smaller one. The total cost will be £4,000.—The special committee on Springburn and Cowlairs halls reported to the town council on Monday that they had met with Messrs. Burnet and T. L. Watson, members of the Institute of Architects, and it had been decided, by modifying the architectural treatment of the halls to some extent, to reduce the cost to £11,000. The new hall is to be erected at the corner of Keppochhill-road and Millarbank-street, and is to be capable of seating 1,200 persons, while a smaller hall is to be capable of accommodating 100 persons. Mr. O'Hare moved that the matter be taken back for the further consideration of two points—that the commission of 5 per cent. to be paid to the architects be reduced to 4 per cent., and that the accommodation be increased. Mr. Chisholm moved that the whole matter be taken back *simpliciter*. When he thought of the sum for which a large and ornate church could be erected, he thought it was ridiculous to spend £11,000 upon such a hall. Mr. W. Paton, in seconding, said the suggested cost was excessive. After some further discussion, Bailie King agreed to Mr. Chisholm's motion, and this became the finding of the council.

HORNSEA. — The improvements at Hornsea, inaugurated to commemorate the Diamond Jubilee, are on the eve of completion, and on the 6th July the waterworks new reservoir, aërator, and filtering beds, the Promenade Gardens, and the Market-place improvement will be inaugurated. Three or four acres of land on the North Cliff have been laid out as pleasure grounds. The adjoining portion of the Lansdowne estate is being laid out as building lots for high-class houses. The view of the parish church has hitherto been impeded by a block of some three or four cottages standing between it and the main street. An opportunity arose for purchasing this obstructive block, and it has now been pulled down, leaving an unrestricted view of the church from all quarters. The total cost has been £560, raised by public subscription and by the grant from the urban council. Thirty years ago there stood in the middle of the Market-place the old cross. A reforming hand ordered its removal, and it was in danger of being broken to pieces when Mr. George Heslop placed it in his garden. It has now been resuscitated, restored, and erected in a prominent position near the church. The waterworks were constructed in 1879 at a cost of £12,000. Owing to the increasing size of the town, it had been inadequate for daily requirements, and the council have therefore spent recently upwards of £2,000 in providing an aërator, filter-beds, and reservoir, which will insure an abundant supply of water for many years to come. To back up these improvements, the North-Eastern Railway Company have doubled the line in places, and have promised an improved train service during the season. Golf links are being laid out, and will be ready next month.

LEEDS.—The corporation of this city are building working-class dwellings on the Camp Field insanitary area. A number of dwellings thereon have to be pulled down, and, in accordance with the Act of Parliament, provision must be made for the displaced tenants. The site selected is Derwent-avenue, Sweet Street-west, Holbeck, and there ten cottages will be erected. Each will have a living-room and scullery, two bedrooms, and an attic, and a cellar. They will be through houses, and each will have its own back-yard, w.c., and ashpit. The site of each house—12 yards by 5 yards—has cost £42, the building upon it will entail an expenditure of £180; and the sewering, kerbing, paving, and flagging will bring the total cost per dwelling up to £233 10s. If the requirements of the Local Government Board are to be complied with, the work cannot be done for less; and, if the corporation is not to lose money by the enterprise, the rent per dwelling must be 5s. 9d. per week, including rates. This will give about 4½ per cent. on the expenditure, sufficient to pay interest and principal in thirty years. Mr. George Carter, of the City Engineers' Department, has prepared the plans for the dwellings.

MORECAMBE. — This popular watering-place already possesses a new theatre, winter gardens, two piers, Regent Park and pavilion, and a revolving tower now all but completed. As an addition to these, the latest scheme put forward takes the form of a massive tower of novel design, and a site has been secured in Calton Lodge and grounds, with an extensive frontage to the promenade between the Central Pier and Emmanuel Church. On a portion of this estate it is proposed to erect a tower 232ft. in height and 130ft. diameter at the base. The tower in general form will be a cone gradually diminishing in diameter, and having four floors above the ground level. The first of these floors will be 70ft. above ground, the second 102ft., the third 132ft., and the fourth 157ft., with a turret reaching to a total height of 232ft. A road track with an electric railway under it will wind round the outside of the eight principal pillars in spiral form. This roadway is to be supported on the inside edge by a girder at the same level, and on the outside edge by pillars from the girder of the stage below. The structural steel work of the tower is calculated to support a strain of 1,000 tons on every portion accessible to the public, in addition to its own weight, and a wind stress of 56lb. to the square foot over its whole surface. The weight of the constructive steelwork of the tower is estimated at about 862 tons. The top gallery will be readily reached by pedestrians, the winding roadway—800 yards in length—being of no greater gradient than 1 in 10. In the sides of the tower from the base to the summit a series of alcoves with seats are to be provided, in which to rest by the way. The whole of the ascent will be illuminated at night by electric lamps. In the basement a circular dancing pavilion, calculated to seat several thousand persons, forms a feature of the scheme. It is proposed that the decoration of the pavilion shall be floral in design, with electric lights in harmony of colour grouped in the centre, and imitation foliage and flowers. The plans also provide for the laying-out of the remainder of the grounds with bandstand and kiosks. The first round from the base of the tower will be an imitation of an Eastern street, with café and buffet in keeping therewith. Outside the tower, on the ground floor, it is proposed to erect shops, with waiting and retiring rooms. The design throughout is Oriental in character. The designer and patentee is Mr. Tom Bradley, architect and surveyor, Bingley, with whom Mr. John Tillotson, auctioneer, Bingley and Bradford, is associated in the undertaking. Messrs. W. H. and A. Sugden, of Keighley, are the architects for the structure.

PERTH.—Lieut.-Col. Frederick Bailey, late R.E., Edinburgh, held a local inquiry last week into the scheme of the Perth Police Commission, under the Perth Improvement Act, in regard to the housing of the working classes. The memorial presented to the Secretary for Scotland set forth that for the purpose of making certain new streets, it was necessary to acquire 130 houses, occupied by persons of the labouring classes, whereof 50 are situated between South-street and City Hall, and 80 in the Old High-street. Evidence was given to the effect that the Commissioners proposed to demolish 139 houses and erect 104, while there were 92 unoccupied houses within a radius of a mile. At the close of the inquiry, Colonel Bailey said he should have pleasure in reporting to the Secretary for Scotland that the scheme seemed to him, in every respect, an excellent one. He hoped it would be very speedily carried out.

SEAFORD.—The Simmons Church Institute at Seaford has just been opened by the Bishop of Chichester. The building is situate in Crouch-street, and makes a decided addition to the buildings of the town, and is described as of picturesque appearance, quaintly designed. The walls, after the Sussex fashion, are constructed of flint boulders, with red brick dressings. The tiled roof has boldly projecting eaves. The hall is well lighted, and has an open-timbered roof in pitch-pine, with moulded principals and pendants stained oak colour. At the rear are retiring and committee-rooms. Mr. C. Morling, of Seaford, is the builder, and Mr. H. Curtis Card, F.S.I., of Lewes, is the architect. The cost of the hall, exclusive of the site, was £1,000. The land and the equipments of the institute were also included in the gift which has been made to the parish by Mr. Henry Simmons, one of the oldest residents in Seaford. The hall seats about 150 persons. The building is set well back from the road, and is inclosed by iron railings, with moulded brick piers at intervals.

SOUTHWELL.—At Tuesday's meeting of the board of guardians, the special workhouse accommodation committee recommended the erection of an

infirmary to accommodate 32 males and 32 females, including lying-in ward, two rooms for special use of workhouse medical officer, nurses' rooms, &c., isolation ward (four beds), tramp wards for 10 males and 24 females (including six separate cells for males and six for females), together with the necessary offices in connection therewith. The new buildings recommended are in accordance with plans prepared by Mr. W. H. Ward, architect, of Birmingham, who estimates the cost at £10,000 to £12,000. Further discussion of the report was adjourned for a month.

WELSHPOOL.—The new Intermediate schools were formally opened, on Friday, by Sir George W. Kekewich, K.C.B., Secretary of the Education Department. The schools are situated in Severn-street, near the Cambrian Railway Station, and in style are a modern adaptation of late Renaissance. The materials used are Buttington red bricks with dressings of stone, and Ruabon tiles. The building accommodates 75 boys and a like number of girls. It is fitted with a kitchen and laundry on the ground floor, and a chemical laboratory and science lecture-room are provided on the upper floor. The headmaster's and headmistress's rooms are centrally placed. The assembly hall will seat 300 people, and the low-pressure hot-water system, with radiator, is employed for heating. The building has been erected by Messrs. Bradney and Lloyd, of Shifnal, from the designs and under the supervision of Mr. Frank H. Shayler, with Mr. Potter, of Welshpool, as clerk of the works. The orignal contract for the school was £3,060, and the total cost has been £3,106 1s. 6d.

WINCHESTER CATHEDRAL.—The central position of the magnificent 15th-century altar-screen in Winchester Cathedral is at last about to be completed. At present the figures of the Blessed Virgin and St. John are gazing up at an empty cross. A design prepared by Mr. G. F. Bodley, A.R.A., has been recently approved by the Bishop, the Dean, and the Chapter, and Canon Valpy has offered to present the work as a memorial of his wife. The design now accepted includes, in addition to the central figure of our Lord on the Cross and some ornamental work surrounding it, a piece of sculpture below the cross, representing the Nativity, with six figures of female saints (three on either side), which will fill the upper portion of the space now occupied by Sir Benjamin West's picture of the Raising of Lazarus. Mr. Bodley has insisted on the removal of this picture as essential to a satisfactory restoration of the screen, it being out of harmony with the general character of the work into which it has been obtruded. Canon Valpy's munificent gift will cost about £1,800. The execution of the work has been intrusted to Messrs. Farmer and Brindley, who undertake to complete it in the course of next autumn.

WOODVALE, BELFAST—The memorial-stones of a new Presbyterian church in course of erection in Shankill-road, Woodvale, Belfast, was laid on Saturday. Upwards of 1,000 sittings being required at a moderate expenditure, the plan of a simple nave and aisles, with shallow transepts occupying an oblong space of about 90ft. by 70ft., was adopted. A feature is the main doorway, placed in the centre of gable with splayed jambs and moulded arches. Above a granite central shaft will be a carving of the "burning bush." The tower, which is pierced by lancet windows, and crowned by a cornice and stone spire, rises to a total height of 120ft. An angular projection is placed on the opposite angle of main gable. All the large windows have stone mullions and cusped tracery heads. At the transepts the windows rise to a higher level. All the gables have copings and apex stones. The walling is of Silurian slate rubble-work, from Ballygowan, County Down, with dressing and quoins of Giffnock sandstone. The internal joinery will be of walnut and pitch-pine, with sheeting of Carolina pine, varnished. The roof of open timber-work will be exposed to the ridge, and sheeted between the principals. A space has been reserved at the rear of the church for a lecture-hall. The contractor for the entire work is Mr. Thomas M'Millan, Ormeau-avenue, and the architects are Messrs. Young and Mackenzie, Belfast.

The opening of the new public buildings for West Bromwich will take place on Monday next. They provide offices for the town council, are situated at Hill Top, and have been erected from plans by Mr. Greatorex, the borough surveyor.

PROFESSIONAL AND TRADE SOCIETIES.

LANCASHIRE AND CHESHIRE ANTIQUARIAN SOCIETY.—The members of this society visited, on Friday, Wardley Hall, Worsley, which has lately undergone a complete restoration. Mr. G. C. Yates (who led the party) read a paper, in which he gave some historical account of the old building and pointed out its more interesting features. When the work of restoration was commenced, he said, it soon became apparent that there was much more of interest in the house than was at first supposed. In all cases where there were beautifully-panelled ceilings, formed of massive and richly-moulded oak beams, it was found that the most prominent of the mouldings had been roughly chopped off, and on or below them had been nailed laths, and the whole hidden by plastered ceilings. Where the larger beams projected—all being of oak—they had been at some former period hacked over and covered with plaster, their sections being converted into plain rectangles with chamfered edges, and (as if to add insult to injury) these "improved" beams had been painted and grained in imitation of oak. The fine old staircase had been similarly treated. The whole has now been restored as far as possible. Visitors to Wardley Hall, Mr. Yates said, will probably miss some of the black and white work with which they were so familiar, but as all that on the north front was sham—being painted plaster, and not timber work at all—it was thought best not to replace it, but to restore the old brick walls which it covered. The restoration, though a costly matter, has resulted in saving from ruin one of the most interesting old houses in Lancashire. The skull—popularly supposed to be that of Father Ambrose—which has been preserved at Wardley Hall for generations, was during the progress of the work placed in an iron safe, and afterwards reinstated in the niche upon the staircase where it has so long lain protected with glazed doors.

GLASGOW ARCHITECTURAL ASSOCIATION.—The annual business meeting of the Glasgow Architectural Association was held in the rooms, 187, Pitt-street, on Tuesday, 7th inst., the President, Mr. W. T. Conner, A.R.I.B.A., in the chair. The secretary read the annual report, including the statements of the treasurer and librarian, which shows the association to be in a flourishing condition. During the session 19 new members were admitted, making an increase in the roll over last year. The syllabus comprised nine members' papers and lectures, over and above which there were four exhibitions of drawings and photographs. There have been three prizes offered for competition, of the respective values of £10 10s., £5 5s., and £2 2s., the first being for a design, and the other two for measured work and sketches. The treasurer's account shows a balance of £41 3s. 6d. on the credit side. The librarian's statement enumerates valuable additions by purchase and donation. The following gentlemen were elected to hold office during the coming session:—President, Mr. G. S. Hill, A.R.I.B.A.; Vice-Presidents, Messrs. John Fairweather, R.I.B.A., and C. E. Whitelaw; Hon. Secretaries, Messrs. R. J. Walker and Alex. Wingate; Hon. Treasurer, Mr. W. S. Tucker; Hon. Librarian, Mr. Hugh Dale; General Committee: Messrs. James Lochead, A.R.I.B.A., Wm. Vickers, W. J. Blain, and Thos. Ramsay.

The sales registered at the Estate Exchange during last week amounted to £180,816, as against £114,050 in the corresponding week of last year.

At the parish church of Newtown, near Wem, a new pulpit and chancel screen, erected from designs by Mr. A. E. Lloyd Oswell, of Shrewsbury, have just been completed. The screen, which is Early English in style and of wrought iron, is by Messrs. Hardman and Powell, of Birmingham, and the pulpit, which is in the same style, and is executed in red Mansfield stone and alabaster, is by Mr. Bowdler, of Shrewsbury.

Oak House and grounds, West Bromwich, which were presented to the town some time ago by Alderman R. Farley, will be thrown open to the public on July 25. The Earl of Dartmouth has consented to perform the opening ceremony. The Science and Art Department have promised a loan of curiosities for a few months, and local gentlemen will lend pictures and other objects of interest. In addition to the improvements effected so far as the building is concerned, the grounds surrounding the old house have been laid out, and a large bowling-green has been provided.

PARLIAMENTARY NOTES.

THE HOME OFFICE BUILDINGS.—Replying to Mr. Allhusen, Mr. Akers-Douglas said, on Monday, that he did not think that it would be possible to set aside any of the money provided by the Public Buildings Expenses Act of this session for the completion of the Whitehall front of the Home Office buildings.

CHIPS.

The Burnley Town Council have appointed Mr. J. P. Greenwood, of Barry, Glam., as assistant borough surveyor, at a commencing salary of £150 a year.

An adjudication in bankruptcy is announced in the case of Henry Hulse, trading as A. and H. Hulse, of Winsford, builder, contractor, and brick manufacturer.

The Municipality of Perugia, having determined to repave the Cambio, have intrusted the work to Cav. Tesurone, Technical Director of the Industrial School at Naples, who designed the tile pavement for the recently-opened Appartamento Borgia at the Vatican. The new pavement of the Cambio will also be 15th Century in style, and executed in Roman majolica tiles.

The eastern portion of High-street, Kensington, is about to be widened between Kensington Palace Gardens and Church-street, at a cost of about £80,000, jointly borne by the vestry and the London County Council. The street, which now has a minimum width of 29ft., will be made uniformly 60ft. wide.

The Hull City Council has committed itself to a series of improvement schemes which, according to Alderman Jarman, chairman of the Finance Committee, amount to the enormous total of £6,000,000.

The account of the capital expenditure on their Municipal Technical School will be presented to the Birmingham City Council in July. At present the revision is not quite complete, but the total expenditure for site, building, and complete equipment of the school will amount to a little over £89,000. The total expenditure authorised by the council was £84,558.

The well-known Camden House and estate at Chiselhurst, which was the home for some years of Napoleon III., and after his death of the Empress Eugénie, is to be saved from the hands of the builder. A syndicate of the residents has been formed, and £33,000 raised to purchase the historic mansion and 70 acres of land. The property will be used for golf links, and the mansion converted into a club-house.

The newly-erected Corporation Art Gallery at Reading has just received the gift of a painting by the late J. B. Burgess, R.A. The picture, which measures 5ft. by 4ft., has been presented by Mrs. Burgess by desire of her late husband, the artist. It represents the Spanish painter Alonzo Cano giving away his sketches as alms to the poor.

The vacation travelling scholarship, instituted a year ago by the Boston Architectural Club, has been awarded for the present year to Mr. Albert C. Fernald, whose trip is to be devoted particularly to the study of the architecture of northern Italy.

The inventory of the heritable and movable estate of the late Mr. George Russell, sculptor, Aberdeen, who died in April last, amounts to £11,987 6s. 1d. Of this sum £4,216 14s. 1d. is personal estate, and £7,770 12s. heritable estate. Mr. Russell leaves his whole estate, after payment of his debts, funeral expenses, and expenses of management, to be divided between the police force and the scavenger force of the City of Aberdeen, in shares of £5 each—"Each body to get a number of shares equal in proportion to the number of such body."

The work of renovation at Cavendish Chapel, Manchester, is approaching completion. The building has been overhauled and repaired on the outside. Inside, the roof, walls, and pews are all being cleaned and beautified. The varnish and other accumulations of nearly half a century have been removed, and the mellowed oak and pitch-pine are once more visible in their natural beauty. The stained-glass windows at the north and south ends of the building have been repaired and cleaned. Tiles are being laid at the front entrance lobbies. The heating apparatus is also being renewed; the order for a new organ has been placed. The electric light has been laid on. The reopening service of the chapel, erected just fifty years ago, and sometimes called the Cathedral of Northern Nonconformity, will commence on Sunday next.

It has been decided by the committee who have raised subscriptions for a memorial to the late Dean Montgomery that the memorial (a recumbent effigy in marble of the Dean) shall be placed in St. Mary's Cathedral under one of the arches which separate the sanctuary from the north choir isle. A sub-committee has been intrusted with the selection of a sculptor; and Mr. H. J. Blanc, R.S.A., architect, is to design the base on which the figure will rest.

STUDY FOR THE TOWER OF A CIVIC BUILDING.

This composition for a tower and gable end of a civic building is conceived in a style described by the author, as being "devoid of the better principles of architectural design," and he admits that his conception disregards "modern practical requirements." There is, however, a freedom from restraint in his proposal which, notwithstanding a certain redundancy of detail, is marked by an endeavour to realise a breadth of treatment which shall accord with the scale of its enrichments. Mr. Robert Boughton says the scheme is designed in a modern French spirit, with peculiarities and details which he would not hesitate to carry into execution. The desire for originality thus displayed, at least, is interesting, and, at any rate, the tameness of the ordinary and commonplace has been somewhat vigorously avoided. The bold handling of the drawing harmonises with the design, so that the sketch, it may be readily acknowledged, makes an attractive, if somewhat unusual plate.

THE "RED HOUSE," HARPENDEN.

This country house, the residence of Mr. A. Vaughan Stevens, has lately been erected on the site of a former building which two or three years since was destroyed by fire. The new house, as shown by the accompanying plans, is entirely unlike the previous one, though the foundations of the original building determined the shape on the plan of the leading walls of the present one, with a trifling extension at the end of the billiard hall, and of the cloak-room and pantry to the rear. The roominess and spaciousness of plan, coupled with the isolation of the kitchen and servants' departments, which are also contrived for ready service, may thus briefly be referred to. The building is in red brick, with Portland stone entrance, and St. Aldhelm quarries Bath stone dressings elsewhere, the roofs being covered with tiles. The windows are throughout fitted in the transomed lights with metal casements, by Messrs. Wenham and Waters. The Cadogan Ironworks supplied the steel girders. The quarried and shaped glazings were executed to special patterns by Messrs. Aldam Heaton and Co. The carving was done by Mr. Nathaniel Hitch. The purpose-made copper furniture was supplied by Messrs. Hart, Son, Peard, and Co., who did the wrought-iron work. Oak floors are laid in all the best rooms, and American white wood, stained dark oak, is employed for the joinery where oak itself is not used. The chimneypieces were supplied by the Coalbrook Dale Company, where special ones were not introduced. The white and black marble paving was supplied by Messrs. Farmer and Brindley. A feature is made of the hall and staircase, with its gallery over, and another point of interest is the ingle in the dining-room. The well-matured grounds and well-kept gardens surrounding the house add much to the interest of the building. The general contractors were Messrs. C. Miskin and Sons, of St. Alban's. The architect is Mr. Maurice B. Adams, F.R.I.B.A.

PASSMORE EDWARDS CRIPPLES' HOME, BOURNEMOUTH.

The building, as shown in the illustration, has been erected on a charming site in Alum Chine, by the liberality of Mr. J. Passmore Edwards, whose gift it is to the Ragged School Union, and will accommodate about 25 crippled children. The architect is Mr. Frederick Warman. The Marquis of Northampton, as president of the Ragged School Union, opened the home on Tuesday last. Nearly 40 friends travelled from London to attend the ceremony, among them being Lord Northampton, Mr. Henry Wood (chairman of the Ragged School Union), and Mr. J. Passmore Edwards. The Mayor of Bournemouth, who presided, said he felt sure that Bournemouth would help forward the new home, as they were already helping so many other local institutes of a philanthropic character. Lord Northampton expressed the pleasure it always afforded those engaged in Ragged School Union work to receive letters of sympathy from outside London. When the offer came from Captain and Mrs. Harrison to start a temporary cripples' home in Bournemouth, his advice to the secretary was to "jump at it." He acknowledged the great debt of gratitude owing to Mr. Passmore Edwards for a further proof of his generosity in erecting the home, and hoped his example would be followed, so that all the 6,000 crippled children under the notice of the Ragged School Union might spend part of their lives beneficially at Bournemouth or some other seaside resort.

MILL HILL SCHOOL CHAPEL.

On Wednesday next, the 22nd inst., this important and interesting addition to the buildings of Mill Hill School is to be opened. The architect is Mr. Basil Champneys. The drawings which we give to-day somewhat fully illustrate the work, which is marked by several distinguishing features. The enriched plastered ceiling of the interior adds much to the effect of the chapel, which is, of course, seated college fashion. The vestry is situate on one side of the sanctuary, and the organ is placed on the other, a projecting gallery being contrived over the stalls on the vestry side facing the organ. There is a public gallery at the west end. The materials are red brick and stone, with tiles for the roofs.

CLEVELAND CHAMBER OF COMMERCE.

We give this week a double page of detail of this building, which we illustrated last week, and of which Messrs. Peabody and Stearns are the architects. Both illustrations are produced from the *American Architect*.

CHIPS.

The urban district council of Wallasey have decided to purchase the Woodlands Estate, adjoining Liscard Vale, and having a frontage to the esplanade, for conversion into a public park. The estate contains 12,500 square yards, and the price given is £3,500.

At the last meeting of the plans committee of the Aberdeen Town Council, plans of new buildings representing a value of £7,500 were approved. The plans include an addition to the convent of St. Margaret's at Spital.

At the Wesleyan chapel, Lichfield, a new organ, build by Messrs. Nicholson and Lord, of Walsall, was opened last week.

The Local Government Board have intimated that they will assent to a loan of £40,000 being raised by the Exeter City Council, for the purpose of carrying out the Cameron scheme for disposing of the sewage by the aid of the septic tank. Under this system the sewage is destroyed by bacteria.

The Barlow Recreation Ground at Blackpool Bridge, Bury, Lancs, is about to be laid out from plans by Mr. J. D. Mould, architect, of Bury and Manchester.

The second electric tram line into Dublin—that from Haddington-road to Nelson's Pillar—has now been completed. On this line centre poles are laid for the entire distance, but in other respects the installation is the same as that on the Clontarf section.

COMPETITIONS.

Plymouth.—The town council recently decided, in response to a memorial from the local architects who were invited to send in competitive designs for the buildings to be erected in Tavistock-road and Tavistock-place, to increase the premium for the best design from £150 to £250. The architects replied to this by an expression of regret that the main point of their objection to the conditions had not met with a more favourable reception. The town clerk was thereupon requested to ask whether, if the Special Works Committee were prepared to consider the suggestion submitted, the architects would waive their requirements in relation to the appointment of a professional assessor. To this the architects replied unanimously declining to compete unless a professional assessor was appointed. The committee then resolved that the views of the architects be met by the following:—A professional assessor to be agreed to, provided the plans become the property of the Corporation, the premium to the successful architect to be £250, and competitors to be instructed that the rents to be catered for are to be about £100 per annum, with the exception of the two end sites, which are to be specially treated. The remuneration of the assessor is to be fifty guineas. The town clerk is to obtain the views of the architects upon the offer as it now stands, with a view to obtaining the sanction of the committee to the selection of an assessor.

Trowbridge.—The local Technical Education Committee recently invited architects to submit designs for a proposed technical institute, a feature of the competition being that the first premium of £40 was not to merge in the successful architect's commission, as is too usual, but that he was to be paid the customary 5 per cent. The limit of cost was £5,500; designs were to be sent in by May 28; and Mr. Edward W. Mountford, F.R.I.B.A., of London, was appointed assessor. Sixty-seven designs were received, and the assessor's award, which has been adopted, is as follows:—First premium (£40): Mr. Thomas Davison, A.R.I.B.A., 59, Great Ormond-street, W.C. Second premium (£30): Messrs. Briggs and Wolstenholme, Central Buildings, Richmond-terrace, Blackburn. Equal third premium (£20, to be divided): Mr. A. Dunbar Smith, 28, Theobald's-road, Gray's-inn, W.C.; and Messrs. A. G. Hall and Thos. H. Bishop, Jun., A.R.I.B.A., Leighton Buzzard. Highly commended: Mr. T. E. Thickpenny, A.R.I.B.A., Breydon House, Lansdowne-road, Bournemouth, and Messrs. J. H. Tyars and E. T. Jago, 16, Garfield-road, Lavender Hill, London, S.W.

Wimbledon.—Colonel C. A. Luard, C.E., a Local Government Board inspector, has held an inquiry into the application of the urban district council for sanction to borrow £1,050 for the purchase of land in South Wimbledon as a site for the proposed public baths. The district council has decided that the following architects be invited to compete for the plans:—Mr. W. E. Hewitt, Mr. R. J. Thomson, Mr. R. A. Hinds, Mr. A. Ardron, Messrs. G. Elkington and Sons, and Messrs. F. J. Smith and Maurice B. Adams. The total cost is not to exceed £7,000.

A new chancel screen designed by Mr. G. F. Bodley, A.R.A., was unveiled last week at the parish church of Church Stretton.

The Theatre Royal at Barnsley is being built from plans by, and under the supervision of, Mr. Herbert Crawshaw, of 13, Regent-street, in that town.

Mr. Tom Vickers, surveyor, Newark Rural District Council, was on Monday last appointed surveyor to the Bisley Urban District Council. There were 119 applicants for the post.

An agricultural college under the Harper-Adams Foundation is to be built at Edgmond, near Newport, Salop, and tenders have been accepted from Mr. John Gethin, Shrewsbury, for the main building, and Mr. Muirhead, Newport, for the outbuildings. The site of the college is on the road leading from Newport to Shrewsbury, to which one of the frontages will face. The work will be put in hand in July.

Some new shops in course of erection at Castle Mona are nearing completion. The building of the premises had been carried out by a local tradesman, but the flat roofing, which is a novelty in the Isle of Man, is the work of the Vulcanite Roofing Company, Belfast, and has been completed under the supervision of Mr. Jno. Loughton, their Birmingham agent.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., L., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Correspondence.

STONE-CARVING IN NEW YORK.

To the Editor of the BUILDING NEWS.

SIR,—Amongst the pile of letters I find awaiting my return from South Africa is one from an old apprentice of my own, who now occupies, and most worthily so, a prominent position in New York. The following extracts bearing upon, in the main, architectural carving, will probably be read with interest by many of your practical readers.

Its writer says: "How time flies! It is now more than twenty years since I first entered your studios at Exeter. I was then a simple lad of sixteen summers, just fresh from school. What changes I have seen since then! I am grateful to say, however, I have received great profit during after life by your early instructions. The manner in which those teachings were administered I confess I thought a bit 'tough' at the time, but I am thankful enough for it now. I have since learnt to realise to the full that the greatest curse a young fellow can have in this 19th century is a 'milk-and-water' apprenticeship.

"Stone-carving here has undergone many changes during the last few years. A new school of artistic architects have risen up almost unconsciously amongst us. These are fast introducing a far better style of architecture into New York and the United States generally than was the last prevailing one—*i.e.*, rude Romanesque *à la* Richardson. The style most affected now by our best and leading men is French Renaissance. The young architects here have, nearly all, more or less, been students in the Ecole des Beaux Arts in Paris. This training has inculcated in them a deeper feeling than has heretofore existed on this side for refined ornament. Of course, the great drawback one has to deal with is that carving and architectural sculpture is looked upon by clients almost entirely from a commercial point of view. The average moneyed New Yorker has no artistic feeling within him. He worships the almighty dollar, and he wants as much as he can get for his money. Quantity, not quality! It is this would-be prostitution of art by the newly-made rich our architects have to fight so sorely against.

"In general building, machinery is used more than ever. It is especially largely introduced into stone-cutting. This has practically nearly wiped the stonemason proper off the face of the earth here. Those that are left are reduced to little better than mere mules, beasts of burden, with little else to do than superintend fixing, and now and then knock off a joint. This saving of labour, however, has indirectly been advantageous at once to the stone merchant and to the stone carver. The master mason is now better able to compete with terracotta manufacturers. More stone is introduced on buildings than ever, and the carved decoration is of a much superior order, and infinitely more refined than formerly. During the last two or three years granite and marble (especially the former) have been even more largely introduced than heretofore. Its use does not, however, affect materially the labour market of New York, for it comes here in the main, all worked and ready for fixing, shipped direct from the practically exhaustless quarries in Maine and Vermont. There it is worked by imported Italians, who receive as remuneration next to nothing, live like the cattle of the field, in the companies' sheds, and purchase all the little they require at ruinous prices from the truck shops 'run' by their employers. The Italians and the *Padrone* system unitedly are the curse of American labour.

"Although more carving has been carried out here during the last few years than formerly, the increase has been of no material benefit to the employée individually. Unfortunately, the supply of carvers far exceeds the demand. There are always plenty of excellent workmen walking Broadway, with their hands in their pockets, chanting the mournful cry of: 'We've got no work to do.' This lack of employment is mainly due to the large immigration of carvers during the last five years from Italy and Germany. Strange to say, during that period of time we have only had three or, at the most, four carvers emigrate here (I am in a position to speak distinctly upon this) from the British Isles. These have all since returned, and many others, who found trade here so flourishing years ago, have gone back to England too, hopelessly dispirited, and penniless.

"As a matter of absolute fact, America is now no place for a working man. For those who have money to speculate, it is, perhaps, not a bad country: there are plenty of syndicates and trusts into which they may float their capital. At the same time, what in England would be justly termed 'roguery' is simply 'smart'here; and English speculators more often than not get their fingers burnt. They are seldom lucky enough to turn over the 'cent. per cent.' newcomers are often so sanguine of making.

"The Stonecarvers' Association in New York is quietly doing real good work, and its relations with those of the employers' association are excellent and cordial. All good work in the stone-carving line is now in the hands of three or four reliable firms, instead of, as formerly, spread about amongst thirty or forty, most of whose sole stock used to be half a dozen chisels, a hammer, swing-ladder, and paint-pot!

"We have had a fairly hard winter, the temperature being often at 39° below zero. Summer is now, however, smiling brightly upon us, and where a few months ago we were suffering from the bitter cold, we are, to-day, perspiring and gasping in the sun. The extremes of climate in this country are more trying than the average stay-at-home Englishman can form any idea of."—I am, &c.,

Exeter. HARRY HEMS.

The Parliamentary Committee of Newport Town Council recommend the purchase for £5,350 of a site, belonging to the Ecclesiastical Commissioners, near Caerleon, and containing about 53 acres, for the new borough lunatic asylum.

Intercommunication.

QUESTIONS.

[11966.]—**Ivywood.**—I should be glad of any particulars regarding the wood to be obtained from the stem of the common climbing ivy. I have a lately-felled specimen of 9in. diameter, which, being unseasoned, is difficult to judge, and therefore should like facts from any who may have had experience of this wood.—DARK GREEN.

[11967.]—**Testing Cement.**—Will feel much obliged if one of your practical readers would inform me of the proper way to test the strength of Portland cement, and also to name the best cement made.—STUDENT.

[11968.]—**Soundproof Walls.**—In building semi-detached villas, can any means be adopted to prevent transmission of sound from one house to the other?—M.

[11969.]—**Insurance.**—I am a jobbing and contracting builder, employing all branches of the trade, one-third of the men being constantly in employ, and the other two-thirds being migratory workmen, and it has occurred to me that a system of insurance might be adopted, and may be self-sustained by each workman paying a very small amount weekly. At present when a workman is ill his fellow-workmen and myself help him by subscription; but this is very unsatisfactory, for obvious reasons. I shall be glad if any of your readers have a workable scheme, and would inform me of the same through the medium of your valuable paper, as there is no doubt other employers would adopt any likely idea for what is a felt want in my district. The great difficulty with me is the fact that some of the workmen are only employed for two or three days, while others have been with me for twenty years.—ASSURANCE.

[11970.]—**Fixing Stone.**—Is a plugged joint with lead a reliable one for joining curbs and cornices? If there is any better mode of fixing other than cramping with metal, I shall be glad to hear. Also whether limestone is better than lead for fixing iron to stonework? There are some who say that it is not so good, as a chemical action takes place between the sulphur and stonework. Is Spence's metal better?—A LEARNER.

[11971.]—**Flare-Burnt Lime.**—This is burned in special kilns in which the lime is kept from contact with the fuel and smoke for the purpose of keeping it cleaner. Seeing that it is dearer than lime burnt in the ordinary kilns, what are the special purposes for which it is used, and where?—W. K. R.

[11972.]—**Hydraulic Engineering.**—Can anyone recommend an elementary treatise on practical hydraulics that will give all the necessary principles and applications to dams, river and quay walls, pipes and bends?—A. B.

[11973.]—**Drain-pipe.**—I intend to build six small houses, each house 15ft. by 23ft. internal dimensions, and two stories in height; yards 15ft. by 20ft. In each yard I intend to fit up a water-closet, which can be well flushed from town supply and properly equipped tank. I should like to know if a 6in. earthenware pipe is sufficient to carry off all slops from yards and closets. Some advise to lay a 9in. pipe, having 4in connection to closets. I am sure many of your readers could advise me on this point, also as to ventilation. There is a fall of 5in. from *a* to *b*, and from *b* to *c* there is a fall 8in. in a distance of 35ft. The distance from *a* to *b* is 100ft., and I am anxious to know how to ventilate the sewer and connections in yards; also how I shall put in a trap near main sewer at *c*.—SANITAS.

[11974.]—**Chain Bond.**—I have to design a small stone dome about 15ft. in internal diameter. Is it necessary to have any tie, and what should it be like? I thought a circular flat bar jointed in four pieces would do. Should like some practical opinion on the best form and section, and how inserted at the base of dome?—CONSTRUCTION.

REPLIES.

[11963.]—**Drawing.**—I have always understood that only absolutely black ink is suitable for process reproductions. Inks specially prepared for this purpose are sold at stationers.—LOUIS EAWOLO.

[11964.]—**Woodworking Machinery.**—The machines that would suit you vary according to the size of your business, the amount you desire to lay out, and the kind of work you require to be done. There are numerous manufacturers of machinery who would gladly supply the information you require.—LOUIS EAWOLO.

An interesting ceremony was performed at Bristol on Saturday last, when the city engineer, Mr. T. H. Yabbicom, C.E., on behalf of the officers in the city engineer's department, made a presentation of a handsome polished oak pedestal writing-desk to Mr. W. S. Skinner, on his resigning his appointment as architect under the corporation, to engage in private practice in the city.

The jury of the International Art Exhibition at Vienna have awarded their diplomas of honour, with 20 large and 39 small gold State medals. Three of the former and five of the latter were given to English exhibitors—namely, a large gold medal to Edwin Austin Abbey, A.R.A., for his "Hamlet"; to Arthur Hacker, A.R.A., for his canvas "The Cloister or the World?"; and to Edward Onslow Ford, R.A., for a plaster statue. A small gold medal was awarded to Frederick Arthur Bridgeman, in Paris, for his canvas of "The Terrace"; to R. B. Nisbet Comrie, Scotland, for his water-colour "Scotch Autumn"; to Charles Sprague Pearce, for his painting "Flock of Sheep"; to Ralph Peacock, London, for his painting "Falsehood"; to William Stott, of Oldham, for his "Kissing in the Ring"; and to Edward Stott, of Amberley, for his oil-painting "The Old Gate."

LEGAL INTELLIGENCE.

BOARD SCHOOLS AND THE DEPRECIATION OF ADJOINING PROPERTY.—THE QUEEN v. PEARCE—EX PARTE LONDON SCHOOL BOARD.—In the Queen's Bench Division on Saturday, Mr. Justice Day and Mr. Justice Lawrance gave judgment in this application, which sought to make absolute a rule *nisi* that had been granted for a *certiorari* to bring up, for the purpose of being quashed, an inquisition, with the verdict and judgment thereon, taken before the Sheriff of London. The case arose out of proceedings for the assessment of the compensation due to Mr. Pearce, land belonging to whom at Maida Vale was compulsorily taken by the London School Board as the site for a school. The land taken formed part of a building estate near the recreation ground at Paddington, belonging to the claimant, Mr. Pearce. The estate was already partly built on, and in the proceedings for the assessment of the compensation, which took place before the Under-Sheriff of London and a jury, it was proposed on behalf of the claimant to give evidence that the houses on his estate in the immediate vicinity of the land taken would be depreciated in value owing to the noise that would be caused by the children attending the school. This evidence was objected to on behalf of the School Board on the ground that such depreciation in value did not form a subject for compensation. It was thereupon arranged that the jury should assess the compensation on this head separately in order that the question whether such compensation could properly be given might be brought before the High Court. The jury assessed the compensation on this head at £1,000. The rule *nisi* in the present case was then obtained. Mr. Freeman, Q.C., and Mr. E. Boyle appeared to show cause against the rule. They argued that, as part of the claimant's land had been taken, he was entitled to the compensation in question on the principles established in the case of "Duke of Buccleuch v. Metropolitan Board of Works," and "Cowper Essex v. Acton Local Board." Sir Edward Clarke, Q.C., Mr. Ram, and Mr. Marchant appeared in support of the rule. They contended that the damage to the claimant's property would not arise out of the use of the school by the School Board, but from the conduct of the children outside the school—a matter for which the School Board were not responsible—and that the damage, therefore, did not give rise to a claim for compensation. Moreover the school would not be erected for two years. They cited "Caledonian Railway v. Ogilvy," "City of Glasgow Union Railway v. Hunter." The Court discharged the rule. Mr. Justice Day said that it seemed to him, without giving any opinion as to whether the amount awarded by the jury was right, that the question had been properly left to the jury in accordance with established principles of law. Part of the claimant's land had been taken, and the jury had found that a school carried on in the usual way on the land so taken would injure the residue of the claimant's land; and they had assessed the injury at £1,000. That they were entitled to do, and it was not for the Court to say whether the sum awarded was reasonable or not. It appeared to him that there was no ground for disturbing the verdict of the jury. Mr. Justice Lawrance concurred.

THE DRAINAGE QUESTION AT CONNAH'S QUAY.—THE ARBITRATOR'S AWARD.—At Friday's meeting of the Holywell Rural District Council, a letter was read from the council's solicitor, inclosing the award of Mr. William Ambrose, Q.C., M.P., Vice-Chancellor of the Duchy of Lancaster, in the matter of the arbitration between the district council and the urban council of Connah's Quay respecting the liability of the latter to pay a sum of £796 8s. 8d. costs of preparing drainage plan, and of litigation with the London and North-Western Railway Company on the subject. Mr. Ambrose orders the Connah's Quay Council to pay to Holywell a sum of £378 4s. 2d. The costs of the arbitration (£132) are to be divided between the two bodies, and Connah's Quay are to have possession of the plans, &c.

SERIOUS CHARGE AGAINST A BUILDER.—At the South-Western Police-court on Friday, John Hagarty, a builder, of St. Ann's-road, Stamford Hill, appeared to answer a summons for incurring a debt of £25 with intent to cheat and defraud. Evidence was given to prove that in August, 1896, the defendant carried on the business of a builder at Grand-parade, Putney, in the name of Messrs. Matthew and Co. Having a contract in hand to make some structural alterations, he applied to Charles J. Woon, a timber merchant, of Grace-church-street, City, to supply him with timber on credit. Mr. Woon, before consenting, made inquiry into the applicant's *bona fides*, and wrote to the defendant asking if a man named Hagarty had any interest in his business. The defendant replied, signing his name as James Matthew to the letter, in the following language:—"I had a partner of the name of Hagarty some time ago, but I am the only man who represents the firm at present." Mr. Woon, feeling satisfied, acceded to the defendant's request, and from time to time supplied him with timber of the value of £25, which had never been paid. On the 6th December, 1897, a petition in bankruptcy was presented against the defendant, and a receiving order was made in the following January, the liabilities being returned at £628 1s. 3d., the name of Mr. Woon being scheduled as one of the creditors. At a public examination the debtor admitted writing the letter, with the intention of deceiving Mr. Woon, and obtaining the timber on credit. In consequence of this admission these proceedings were ordered. Defendant was committed for trial.

THE WAVERLEY HOTEL SCAFFOLD DISASTER, EDINBURGH.—Sheriff Hamilton, in the Edinburgh Sheriff Court on Friday, closed the record, and allowed proof in an action at the instance of Peter M'Glynn, one of the labourers hurt at the Waverley Station accident on the 18th of March, against Messrs. G. and R. Cousin, the contractors, for £200 damages at common law, or £195 under the Employers' Liability Act, in respect of injuries he sustained. The pursuer avers that the height of the scaffold was abnormal, that it was altogether insufficient at the base for a scaffold of such height, and that it was top heavy by having placed on it a steam crane of eight tons, and a hand crane of two tons; and that the wood supplied by the defenders was of the commonest and cheapest kind. The defenders deny that the scafiold was insufficient, and hold that it fell owing to no fault of its design.

RE-ENTRY AND THE RECOVERY OF DAMAGES.—MARSHALL v. MACKINTOSH. — Judgment has been delivered by Mr. Justice Kennedy in this case. The action, which was brought against a builder to recover damages for breach of a building agreement, raised the question whether, when a landowner had exercised the power of re-entry provided by a building agreement in the event of the builder making default and has taken possession of the builder's plant and material on the premises, the landowner is also entitled to recover from the builder the actual damage he has suffered by reason of the latter's breach of contract. Mr. Justice Kennedy said that the only point which he had to decide was the question of the damages which the plaintiff was entitled to, and, as Mr. Justice Field said in "Wigsell v. School for Indigent Blind," few questions as to the principle upon which damages ought to be assessed were free from difficulty. By an agreement in writing of June 10, 1896, the defendant contracted with the plaintiff to pull down and remove certain buildiogs at 47 and 48, Dover-street, Piccadilly, and to build on the site a new structure, which was to be erected in carcase before December 25, 1896. Upon that being done, the plaintiff contracted to grant to the defendant a lease of the land and buildings for 80 years, from June 24, 1896, at a yearly rent of £1,100. Clause 2 provided that if the defendant made default under the agreement "he shall forfeit all benefit under this agreement, which shall thereupon cease and be determined, and all the materials and buildings on the said premises shall be forfeited to, and become the absolute property of, the lessor." Under Clause 11 there was reserved to the lessor, on default being made by the defendant, a power to re-enter upon, and to the immediate possession of, the premises and plant "without making to the lessee any allowance or compensation in respect thereof." The defendant got possession of the site on June 10, 1896, but, except that he took down and removed £200 worth of materials from the old buildings, he did nothing whatever towards the fulfilment of his contract. The fact was that he had entered upon the undertaking as a speculation without the means of fulfilling it. There being no prospect of anything further being done, the plaintiff re-entered on January 19, 1897, as he had a right to do. It was clear that the mere fact of a re-entry did not of itself exonerate the defendant from the liability to damages for breach of contract prior to re-entry (see "Harishorne v. Watson"); but it was contended for the defendant that the effect of Clauses 2 and 11 did limit the plaintiff to such compensation as might be afforded to him by taking possession of the materials, plant, and buildings on the premises at the time of re-entry without any allowance or compensation to the defendant, and that the plaintiff could not claim damages beyond that. His Lordship could not accept that view, for that would be to read with these clauses "as and for liquidated damages," or words to the same effect, and his Lordship was not entitled to do that. It was common enough to find the insertion of such words when there was an intention of the parties so to limit the liability for a breach of the contract. Instances of this were to be found in "Reilly v. Jones," "Lea v. Whitaker," and in "*Ex parte* Newitt—*in re* Garrud." In the absence of some such express words, Clauses 2 and 11 could not be construed so as to deprive the landowner of the right to prove actual damage for the defendant's failure to perform the contract; but the words in Clause 11—"without making any allowance or compensation in respect thereof"—would not operate to prevent the builder from having included in the damages any value which might exist in the buildings, plant, &c., seized by the landowner when he re-entered. The damages must be assessed *rebus sic stantibus*, and it might be the case that, if the structure was nearly completed in carcase at the time of the re-entry, the landowner would fail to prove any substantial damage at all to flow from the breach on which he sued, as he had failed in "Oldershaw v. Holt." The question of the amount of damages had been referred to the official referee, who had made two alternative assessments. He reported that the plaintiff had, after entering, relet at the best rent he could—viz., £800 a year, after the first year, and he assessed the damages at the loss of two years' rent of £1,100 and the loss of £200 a year from June 24, 1899, at 25 years' purchase, amounting to £5,000, making in all £7,200. In the alternative, if the plaintiff was only entitled to recover damages caused by the removal of materials by the defendant and by the loss of possession from June 24, 1896, to January 19, 1897, the official referee found that the amount of such damage was £200, and one year's rent of £900 from June 24, 1896, to June 24, 1897, the earliest date at which the plaintiff was able to relet the premises. The damages must be assessed, his Lordship said, upon well-recognised principles. They must be such as flowed naturally, and, in the circumstances of the case, necessarily from the breach of contract; further, they must be such damages as might reasonably be shown to have been in the contemplation of the parties when they entered into the contract. Subject to this, the plaintiff was, in the language of Mr. Justice Field in "Wigsell v. School for Indigent Blind," "entitled to have his damages assessed at the pecuniary amount of the difference between the state of the plaintiff upon the breach of the contract, and what it would have been if the contract had been performed." If the defendant had performed this contract before the date of re-entry, the old building would have been removed, and a new and valuable structure erected on the site, and if he had then failed to complete the plaintiff would have had no difficulty in getting someone to take up the undertaking on at least as profitable terms. But, as it was, the plaintiff had only been able to relet on terms involving a loss of £7,200. His Lordship could find no fault of principle in this assessment. "Oldershaw v. Holt" was the case most in point, and there it was held, it being a case of re-entry after neglect to build, that the jury might properly give a verdict on an estimate of the plaintiff's real damage, taking into consideration an increased rent secured by the agreement which he had made with a new lessee. Upon the same principle it was right in this case to consider the reduced rent which the plaintiff had been obliged to accept from a new contractor. As to the alternative assessment, his Lordship did not think that the damages could, according to legal principle, be assessed upon that basis. There would, therefore, be judgment for the plaintiff for £7,200.

BUILDING LAWS OF BOUNDARY WALLS.—At the South-Western Police-court, last week, Mr. Francis heard a summons against James Chapman, of 79, Sydney-street, Chelsea, at the instance of the London County Council, for erecting a building beyond the general line of frontage on the south side of Falcon-grove, Battersea. Mr. T. D. Chilvers represented the Council, and Mr. Hoskins, appeared for the defendant. It appeared that the defendant commenced to erect a washhouse at the rear of the premises, and was requested to discontinue, as the buildings extended beyond the general line of frontage. He did so, but instead erected a wall 7ft. 6in. high. Mr. Chilvers argued that the defendant had been guilty of a technical offence, as the wall was beyond the line of frontage, and in the case of "Ellis v. the Plumstead Board of Works" it was held that a wall 7ft. 6in. high was a structure within the meaning of the Act. Mr. Hoskins contended that there was no case to answer, inasmuch as the building objected to had been removed. The wall was only 7ft. high. Mr. Chilvers said, according to the decided case, a boundary wall should not exceed 6ft. 9in. high. Mr. Francis declined to say anything as to that, although he was of opinion that the wall in question was not a building within the meaning of the Act. As the defendant did erect a building in the first place, he would be fined 1s., with 2s. costs.

STREET IMPROVEMENTS AT PUTNEY.—At the Newington Sessions House, on Thursday in last week, before Mr. Loveland-Loveland (deputy chairman) and a special jury, the case of Marshall v. Wandsworth District Board of Works came on for hearing. This was a claim for compensation in respect of the acquirement of the leasehold premises, No. 151, Upper Richmond-road, Putney, occupied by the claimant, Mr. H. L. Marshall, job master, for the purposes of street improvements. The premises in question are held for an unexpired term of 15 years. The carrying-out of the improvement scheme would necessitate the reconstruction of the claimant's premises, by which he would be deprived of certain accommodation. An adjoining shop, let by the claimant at 7s. per week, would be completely abolished, whilst the whole of the job-master's premises would, it was alleged, be de-

preciated in value to a considerable extent through the loss of washing space, &c. Mr. Percy Henry Clarke, F.S.I. (late Ward and Clarke), 2, Lancaster-place, Strand, submitted plans, and estimated the reduction in value of the premises as a whole at £1,493, and other witnesses for the claimant were Mr. Daniel Watney, 33, Poultry, E.C., estimated loss £1,351; Mr. Samuel Walker, Moorgate-street, E.C., £1,392; Mr. A. W. Taylor, High-street, Putney, £1,482. For the Wandsworth District Board of Works, it was contended that the claim was exaggerated, and the witnesses called included Mr. Alex. R. Stenning, 121, Cannon-street, E.C., who estimated the fair amount of compensation at £623; Mr. W. Bennett Rogers, 78, Gloucester-road, S.W., £638 1s.; Mr. G. H. Brougham Glasier, 7, St. James's-street, S.W., £631 15s. 6d.; and Mr. J. C. Radford, surveyor to the district board of works, £621. The jury awarded £1,200

CHIPS.

The corner-stone has been laid of a new church for All Soul's parish at Captain Fold, Heywood. The building will cost about £5,000, and it will be of faced stone, with a red brick interior.

The Local Government Board having declined to entertain an application from the Cheltenham Town Council to borrow £2,710 15s. for the payment of the amount at which Mr. Robson had agreed to settle his account for architect's fees in connection with preparing plans for a kursaal and municipal offices, which have since been abandoned, the town improvement committee proposed that the amonnt be transferred from the water surplus account to the borough fund account. This was strenuously opposed, but was carried as a recommendation to the finance committee to transfer and pay the account.

The Marquess of Worcester has notified the tenants that the Beaufort Estates in Monmouthshire are to be sold. The property contains 26,000 acres of land, with a rent-roll of £30,000, and includes eight castles and one abbey—the famous Tintern Abbey—and 26 licensed houses.

A covered reservoir is being built for the Teignmouth Town Council on the Landscore-road, and will be completed within the next fortnight. Mr. Fisher is the contractor.

The Board of Trade have issued the modified and now confirmed order made by the Light Railway Commissioners authorising the construction of a railway commencing by a junction with the Helston line of the Great Western Railway at its termination and terminating at the Lizard, a distance of 11 miles 2 furlongs 9 chains. The order provides for the construction of this line by a new company, which is incorporated with a share and debenture capital of £10,000. The time allowed within which to construct the railway is five years from the 21st April, 1898.

The chancellor of the diocese of St. Alban's (Mr. A. B. Kempe, Q.C.) held a court at St. Alban's Cathedral on Tuesday, at which an application was made on behalf of Lord Aldenham for a faculty to be decreed authorising him to complete the work of restoring the cathedral high altar-screen. Lord Grimthorpe, it was stated, had had notice of the citation; but he had not entered an appearance, and the application was unopposed. The chancellor granted the faculty as prayed for.

Mr. George W. Willcocks, M.I.C.E., L.G.B. inspector, has held a public inquiry at Bacup into an application of the town council for sanction to borrow £7,100 for sewerage works.

The monthly *Memorandum* of the Labour Department states that employment in the building trades remains brisk, the percentage of unemployed union members at the end of the month being 1·2, compared with 1·1 for April, and 0·8 at the end of May, 1897. The furnishing trades continue busy, the percentage of unemployed union members at the end of May being 1·0, compared with 1·2 in April, and 1·1 in May of last year.

In St. Mary's Hall, Coventry, on Tuesday, Mr. G. W. Willcocks, M.I.C.E., an inspector of the Local Government Board, held an inquiry relative to the Coventry Corporation's application to borrow £33,000, for the purposes of extending the corporation's electric-light undertaking.

A singular scene was witnessed in the Court of Appeal on Monday, when Lord Justice A. L. Smith and the other judges dismissed the appeal of a plaintiff who had, by an order of Mr. Justice Bruce, been deprived of his right to sue *in formâ pauperis* for sums he alleged were due to him for building repairs executed for a lady. Plaintiff, it was stated, had not only sent a letter to counsel for the defence, threatening him with an action for libel, but had imputed bad faith to Mr. Justice Bruce. On hearing the decision of the Lords Justices, he declared it was simply robbery, and announced his intention of going to the House of Lords for justice.

STATUES, MEMORIALS, &c.

CARDIFF.—The Marquis of Bute, under the direction of Mr. C. B. Fowler, F.R.I.B.A., is marking the grave of Llewellyn Bren in the restored floor of the Greyfriars Monastery Church, and that of Bishop Ecclescliffe in the floor (also restored) of the Blackfriars Monastery Church. In the excavation of the Greyfriars floor a large number of remains of broken stonework used in the original building was unearthed, and it was these remains which enabled Mr. Fowler to trace out the style of architecture employed. It is intended to erect a small building near the Blackfriars Church as a museum for the storage of all these relics. At the Corpus Christi festival at Cardiff Castle on the 9th inst., the altar was erected on the very site of the old high altar of the Blackfriars Church, and the tomb of Bishop Ecclescliffe, with its new memorial stone, which bears a long Latin institution in Gothic characters, finds a place within the chancel in front of that altar. In the Greyfriars Church the new tile floor, after the original design and in the colours of the Order, has been laid by Messrs. Godwin and Son, of Lugwardine, near Hereford. The memorial stone for Llewellyn Bren, like that over the remains of Bishop Ecclescliffe, is of the hardest Portland, and both memorials were executed by Mr. Clarke, of Llandaff, under Mr. Fowler's supervision.

CROYDON.—To the Municipal Buildings have been added a statue of Archbishop Whitgift on the pedestal left vacant by the architect, Mr. William Henman, on the corner of the Corn Exchange in Katharine-street. The statue is the gift of Sir Frederick Edridge. It is of Portland stone, and is the work of Mr. J. Wenlock Rollins. The figure is in high relief, and the Archbishop is represented sitting reading a book. The figure is clothed in the fashion one is accustomed to in the ecclesiastical portraits of Elizabeth's time.

At Partick Police-court, on Friday, John M'Pherson, Squire-street, Whiteinch, having allowed several dwelling-houses in a new property at Whiteinch to be occupied before they were certified as fit for habitation by the burgh surveyor, a fine of two guineas was imposed.

It is very probable that the site of the new West Riding Asylum will be the Storthes Hall Estate. The council's requirements were five hundred acres, to be inclosed in a ring fence, twenty-five acres of plateau for buildings, and to be free from winning. The owner of the estate has been able to meet these requirements, and the surveyor to the West Riding County Council was therefore able to present a satisfactory report in regard to the land. The price asked by the owner is £39,500, or £75 an acre.

The corner stone of the new church of St. Andrew at Bishopthorpe was laid on the afternoon of St. Barnabas's Day by the Hon. Mrs. Maclagan, wife of the Archbishop of York. Mr. C. Hodgson Fowler, F.S.A., is the architect, Mr. A. W. Bowman the builder, and Mr. Bolton the clerk of works.

The town council of Warwick decided, on Tuesday, to discontinue the practice of paying the surveyor extra sums for special work, and to substitute a fixed salary of £200 a year, with a house, rent and rate free, and £20 for superintending the fire brigade. It was pointed out that it did not involve any increase of salary, as the sum is based upon the average payments of the last three years.

The urban district council of Portishead wishing to borrow £3,000 to complete the sewerage works, an inquiry was held on Tuesday at the Assembly Hall, by Mr. W. O. E. Meade-King, inspector from the Local Government Board. The money expended up to date has amounted to £13,603 1s. 7d. The increase in expenditure was caused chiefly by the failure of the original contractor, Mr. Wilkins, to finish the works. The re-letting of the works to Mr. Binn, the second contractor, added considerably to the expense. Other difficulties had occurred from rock excavation; running sands, water-logged soil, and soft spongy clay necessitating the use of concrete beds. In answer to the inspector, Mr. T. Moss Flower, the engineer, said the works were being carried on to the plans of the original scheme without material alteration, and would, it was anticipated, be finished by September next. The second contract by Mr. Binn was about 15 per cent. higher than Mr. Wilkins's, and the total cost of the work would amount to £18,500.

The traffic on the Great North of Scotland system has recently so increased, that new locomotive and other workshops are to be erected at Inverurie. The contracts include the erection of a carriage and waggon shop, 362ft. by 182ft. wide; paint shop, 242ft. by 122ft. wide; smithy and foundries, 270ft. by 102ft.; and boiler-fitting and erecting-shops, 270ft. by 263ft. While on the same area, these blocks are each separated from the other by a wide, open space, so as to provide against the spread of fire. The contracts just concluded form the first section of the work, and will occupy fifteen months in completion. The cost of the operations now sanctioned is about £40,000.

WATER SUPPLY AND SANITARY MATTERS.

BARMOUTH.—On Saturday new waterworks at Barmouth were formally opened by Mr. T. W. Russell, M.P., Parliamentary Secretary to the Local Government Board. These works are situated among the Merionethshire mountains, and the reservoir contains a storage of 100 million gallons, of which 52 million gallons are for the supply of Barmouth, and will supply a population of 20,000 for 104 days. The works cost nearly £30,000. At a banquet held in the afternoon Mr. T. W. Russell said that since its establishment the Local Government Board had sanctioned the spending upon sanitary work of £102,760,000. Whereas before the establishment of the central authority the expenditure upon sanitary work in the kingdom during ten years was only £2,956,000, the sum spent during the last ten years was £46,000,000.

Alderman W. Barford, of Peterborough, head of the well-known engineering firm of Barford and Perkins, and chairman of the council of Peterborough Agricultural Society, was found dead in his bed on Friday morning. Mr. Barford was for a short time a member of the old Improvement Commissioners at Peterborough, but on the incorporation of the city became a councillor, and was elected to the aldermanic dignity in 1883, in which year he was also mayor.

Memorial-stones of a Wesleyan day-school were laid at Paulton, Gloucestershire. The buildings will accommodate 300 children, are Domestic Gothic in style, and built of local stone, with free-stone dressings. Mr. W. F. Bird, of Midsomer Norton, is the architect, and Messrs. Keeling and Sons are the builders.

The Oulton Union Infirmary, near Lowestoft, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, and Shorland's patent exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Through the courtesy of the contractors, Messrs. James Young and Sons, Edinburgh, the members and friends of the East of Scotland Engineering Association visited on Saturday the works in course of construction in connection with the new reservoir at Talla. The works in course of construction were inspected under the guidance of Mr. James Young and Mr. Williamson, the contractors' engineer.

Miss Hay, the daughter of the American Ambassador, opened, on Monday, as a public garden, the long-disused burial ground which lies at the rear of the Robert Browning Hall, York-street, Walworth. The garden has been prettily laid out under the direction of Miss Wilkinson, the landscape gardener connected with the Metropolitan Gardens Association. After Miss Hay had formally declared the garden open to the public, the further ceremony was performed of receiving the gift of a Doulton ware drinking fountain presented by Mr. H. Lewis Doulton, in commemoration of the fact that his father, the late Sir Henry Doulton, had, with other members of the family, been baptised and connected with the old chapel.

In the Stadtpark, in Vienna, on Monday, a monument was unveiled to the well-known Austrian painter, Hans Makart, who died there in 1884.

At the Passmore Edwards Settlement, Tavistock-place, Mr. Humphry Ward will deliver, this (Friday) afternoon and the three following Fridays, at 3.30, a course of illustrated lectures on "English Art in the Eighteenth Century." The lectures will be for the benefit of the maintenance fund of the Settlement.

The plans of the Royal Duchess Theatre, Balham, have received the approval of the London County Council, and building operations will be commenced within the next few weeks. The plans have been prepared by Mr. W. C. R. Sprague, and the building will accommodate about 2,500 persons. It is entirely fireproof, and no columns are used in the construction. The theatre is to be ready for opening next January.

Four bronze panels have been affixed to the piers of the North Bridge, Edinburgh, two as a memorial of the old bridge, and the other two in commemoration of the opening of the new. The panels are duplicated. Those referring to the new bridge have the city coat of arms at each side, and bear the following inscription: "North Bridge foundation-stone, laid 25th May, 1896, and bridge opened 15th September, 1897, by the Right Hon. Sir Andrew M'Donald. Blyth and Westland, M.M.Inst.C.E., engineers. Sir Wm. Arrol and Co., Limited, contractors. Thos. Hunter, W.S., town clerk." The other panel presents an illustration of the old bridge and a representation of the Old Town looking from the bridge to the south-west, and it bears the words: "Old North Bridge" above the picture, and below it "Founded 1763, widened 1876. Taken down."

Our Office Table.

AT Cambridge University, on Wednesday, the honorary degree of LL.D. was conferred on Mr. F. C. Penrose, M.A., F.R.S., F.R.I.B.A., F.R.A.S.; and on Sir E.J. Poynter, P.R.A., and that of D.Sc. on Mr. Charles Booth, the author of "Life and Labour of the People in London." In presenting Mr. Penrose, the Public Orator, Dr. Sandys, mentioned that the recipient of the honour was an Hon. Fellow of Magdalene College, late President of Royal Institute of British Architects, and first director of the British School of Archæology at Athens. He was welcomed back to his University as one who had taken his degree in the Mathematical Tripos of 1842, and who had thrice rowed in the University boat-race some 57 years ago, only once among the vanquished, but twice among the victors. He was probably the only man living who had stood not only on the summit of St. Paul's, but also on that of the Olympeium at Athens. "Vire ad tantam altitudinem evecto non sine reverentia quadam in hoc templo honoris lauream nostram laeti decernimus." Sir Edward Poynter was eulogised as one whose merits had been tried and approved in a series of important public positions, as a Slade Professor, as Principal of the National Art Training Schools, and as director of the National Gallery. As a painter he had shown a profound knowledge of art, and had been distinguished for the nobility and the purity of his aims.

THE Bishop of Rochester, as Acting-Dean of St. Saviour's, Southwark, appeals for £6,000 to extinguish the building debt on the fabric, all the rest of the £70,000 expended during recent years in rebuilding and refitting the nave from Sir Arthur Blomfield's plans having been met. There is, Dr. Talbot adds, further need of money to provide vestries and a choir practice room, which are positively necessary if decency and reverence are to be maintained. These, with the purchase of the site, will cost £3,000. There is need also for repairs to the tower and to the roof and walls of the choir and Lady-chapel, besides some other work, which would entail an expenditure of another £3,000, but it is not proposed to commence any of these until all the present debt is paid, nor even then until the needed sum is in hand.

MR. WILLIAM WOODWARD, A.R.I.B.A., writes to us to call attention to the threatened spoliation of one of the most beautiful portions of Hampstead Heath. Immediately adjoining the West Heath, and on its north-western margin, stands the estate of the late Sir Spencer Wells, covering an area of 36 acres, and as this land is advertised for sale by public auction, it may fall into the hands of builders, who are tempted to speculate by the announcement that these "gardens and grounds of matchless beauty present unique sites for the erection of first-class houses." As the family of Sir Spencer Wells is open to sell by private treaty, it is urged that the auction should be stayed, and the property acquired as an open space for the public by the co-operation of the London County Council, the Metropolitan Gardens Association, the Kyrle Society, and the Hampstead Vestry, or some of these bodies.

AT a meeting of the court of Edinburgh University, on Monday, it was agreed to make the appointment to the Bruce and John Usher Chair of Public Health and Sanitary Science at the next meeting of the court on the 18th prox. In connection therewith, a letter was read from a benefactor of the university, who desires that for the present that his name should be withheld, intimating that he is prepared to give to the University such a sum as may be necessary, but not exceeding £10,000, to build and equip a laboratory and a class-room to be used exclusively for the teaching of public health in connection with this Chair, the site of the proposed building to be provided by the university. The court, in thanking the donor for the munificence of his gift, resolved to record their gratification that it had taken a form which enabled the University to extend its usefulness by the creation of an institute which was urgently required for promoting the study of public health.

THE Dean of Bristol, Dr. Pigou, states that at the last meeting of the Cathedral Restoration Committee it was decided that the restoration be proceeded with, and that such portions of the external fabric as require immediate attention shall be taken in hand at once. The foreman of the works attended the meeting, and assured the committee that certain portions of the fabric are in a most ruinous and even unsafe condition. The following, therefore, were selected out of the six portions which require restoration:—The Berkeley chapel and roof, estimated cost, £820; the south choir aisle, £450; and the Newton chapel, £300. These works are simply for external repairs to the south-eastern portion of the Cathedral, and the sum required, inclusive of the existing debt of £1,000, is £2,570. Towards this sum about £130 has already been promised.

THE Municipal Art Society of New York, after five years of existence as a voluntary association, has been incorporated, and, under its new and official constitution, is enabled to institute and control competitions for works of art to adorn the city, for the execution of which the society itself does not pay. In pursuance of these new powers, it proposes to invite at once a competition for designs for a city street-lamp, awarding prizes from its own funds, but leaving the execution of the successful design to the municipal street-lighting department. This competition is to be followed by others, including designs for park benches and drinking fountains.

Up to the close of March this year, 3,256 houses had been connected with a new sewage system at Cape Town. The total length of sewers laid at the same date was 30 miles 482 yards. The total amount expended to the same date, including preliminary expenses and extra work, was £167,628.

The buildings which have been recently completed in Newgate-street, Chester, for the Conservative and Unionist Club, at the expense of Mr. Yerburgh, M.P., for the city, were opened on Saturday. The premises contain a billiard room with two tables, reading, card and smoke rooms, lavatories, &c., and there is also attached an assembly-hall, which will be available for political and social meetings. The design was that of Mr. H. Beswick, of Chester, county architect, under whose superintendence the work has been carried out.

The corporation of Douglas, Isle of Man, have decided to increase its water supply by the construction of a reservoir at West Baldwin, capable of containing 300 million gallons. The holding capacity will be six times that of Clypse Reservoir. It will take five years to complete the new scheme, which will place Douglas, with regard to its water supply, in as good a position as any borough of the same size in the United Kingdom.

The week at the Tokenhouse-yard Mart has proved a busy one. Though large estates were not much in request, there was a brisk demand for small-class residential properties, ground-rents, and investments generally. Building land was not quite so actively in demand, but about £800 per acre was paid for 92 acres at Southampton.

On Wednesday week the formal opening took place of the New-street Congregational Hall at Welshpool. Mr. F. D. Ward was the architect, and the builder was Mr. Evan Davies. It includes an assembly-room, with accommodation for about 300 persons, with a committee-room raised a little above the floor of the room, and having folding doors, and this forms a main platform for public meetings. There are also a cloak-room, and a scullery, with boilers, &c.

An elaborate memorial brass has just been set up in Cherry Burton Church, Yorks, in memory of the late Captain Cecil Fowler Burton, Royal Fusiliers, eldest son of General Fowler Burton, C.B., J.P., who died at Mhow, Central India. The memorial "Is erected by his brother officers who served with him in the regiment, in memory of a zealous soldier and a steadfast friend." It was the work of Messrs. J. Forsyth, of Finchley-road, Hampstead.

The outcome of the public competition for a clock-tower at Penang Straits Settlements has been that the municipal engineer's design was chosen by the municipal commissioners, and he was awarded the prize for the best design. Mr. Barnett, a private engineer practising in the Island, has been appointed to supervise the building of the tower.

The Occasional Sunday Ramblers' and North Staffordshire Clarion Field Club visited Moreton Old Hall on Saturday last, and were joined by contingents of other Socialists from Crewe, Leek, and Macclesfield, as well as the Pottery towns, the gathering exceeding 200. After Astbury Church had been visited, the party took tea in the Old Hall. The leader for the day, Mr. Larner Sugden, F.R.I.B.A., of Leek, then read some notes on the architectural history of this famous and comely pile, now fallen on evil days of "restoration" and neglect, making caustic references to the present social system with its foul fungoid growths of modern jerry-builders, &c.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (To-morrow).—London Architectural Association. Visit to Paddockhurst, Sussex, the residence of Sir Weetman Pearson, Bart. Train from London Bridge Station (L.B. and S.C.) to Three Bridges 2.25 p.m.

Northern Architectural Association. Visit to Durham Cathedral and County Council Offices.

Liverpool Architectural Society. Visit to Thornton Manor (the seat of Mr. W. H. Lever) and Sunlight Village. Book from Landing-stage. 2 p.m.

MONDAY.—Royal Institute of British Architects. Presentation of Royal Gold Medal to Professor Aitchison, R.A., President. 8 p.m.

WEDNESDAY.—Society of Arts. Conversazione at the Natural History Museum, Cromwell-road, S.W. 9 p.m.

CHIPS.

A parish-room is in course of erection at Willand, the contractors being Messrs. Chick and Bradbeer.

A new Conservative club is being erected at Epsom, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

A large clock with quarter chimes has just been erected in the parish church of Uppingham, Rutland, by Messrs. John Smith and Sons, Midland Clock Works, Derby.

A private house at the corner of Carr-street and Little Coleman-street, Ipswich, has been converted into business premises. Mr. G. W. Leighten, Princes-street, Ipswich, was the architect, and Mr. Friend, of Sedan-street, in the same town, the builder.

A new post-office is about to be built in Hill-street, Newry, at a cost of about £5,000, from plans prepared in H.M. Office of Works. The contractor is Mr. Alexander Wheelan, of Newry.

The urban district council of Grange-over-Sands have adopted plans, and are making application to the L.G.B. for powers to borrow £10,000 to carry out a sewerage scheme and a promenade for the foreshore. The new sea-wall will reclaim 5¾ acres of land, which will be used as a recreation ground.

The question of the reconstruction of Regent Bridge was under the consideration of the Aberdeen Harbour Board on Monday. On the recommendation of the works committee, it was agreed to proceed with the erection of a new bridge, according to the plans of the harbour engineer, and approved by Mr. Wake, C.E., the consulting engineer. The estimated cost of the bridge is £49,740.

Mrs. Diana Margaretta Moffatt, the relict of Mr. W. B. Moffat, architect, who was for a considerable period senior partner with the late Sir Gilbert Scott, at Spring Gardens, died on the 4th inst. at Roche, Cornwall, after a prolonged illness. Mrs. Moffatt was in her 73rd year.

At their meeting on the 13th inst., the Establishment Committee of the Malens and Coombe Urban District Council approved of the plans, &c., prepared by Mr. T. V. H. Davison, of New Malden, for the new public offices, central fire station, stabling, mortuary, and post-mortem room.

At the Hanley County Police-court, on Monday, Mr. C. Daniel, clerk to the Stoke Rural District Council, applied under the Housing of the Working Classes Act, 1890, for an order against Richard S. Topham, of London, the owner of ten dwelling-houses at Topham's-row, Brookhouse Green, Bucknall, empowering the council to close those houses, they being in a "state so dangerous, or injurious, to health, as to be unfit for human habitation." The defendant did not appear in person, or by representation. Mr. Larner Sugden, surveyor to the rural district council, described the deplorable, dilapidated condition of the dwellings, and defendant was fined £50, and ordered to pay another £7 costs.

The Prince of Wales visited Reading on Saturday for the purpose of opening the College, which has grown out of the University Extension movement. The first home of the college, opened only so lately as 1892, was an ancient building, formerly part of the Hospital of St. John, attached to the abbey of Reading. The accommodation was soon found to be insufficient for the increasing number of students. Mr. Herbert Sutton, chairman of the council, purchased the vicarage of St. Lawrence, adjoining the Hospitium, and the acquisition of this property enabled necessary enlargements to be made on the suggestion of Mr. S. Slingsby Stallwood, the architect, including the building of a dairy institute. The cost of the college properties and buildings has exceeded £20,000.

A new infant school, which has just been added to the parochial schools of Holy Trinity, Taunton, was opened on the 8th inst. The architect is Mr. G. C. Strawbridge, and the builder Mr. Wm. Rendell, both of Taunton.

Trade News.

WAGES MOVEMENTS.

BERWICK. — The plasterers of Berwick, after giving a week's notice, came out on strike on Monday for a rise of 1d. per hour in their wages. The men are at present paid 7d., and the masons 8d. The plasterers ask for the same rate of pay as the latter. The building trade at present is brisk in Berwick. The joiners have also asked for an advance of wages to take effect in July.

MANCHESTER.—The strike of stonemasons, which began on the 15th ult., remains unsettled. The operatives' notice, requiring certain alterations of existing rules and the addition of some new rules, expired on that date. The men were informed that the alterations and additions could not be accepted, and they therefore ceased work. The hon. secretary of the Masters' Association states that the masons had been working 49½ hours per week, and one of their demands was for a 47-hour week, with walking time night and morning, and an advance of a penny per hour (from 9d. to 10d.) The masters offered a halfpenny per hour advance. The men also take exception to a number of rules governing their employment: but the principal object being to the employment of other than masons on stone-working machines. The men further protest against the importation of worked stone into Manchester or the taking of worked stone outside Manchester, limiting the work to a five-mile radius. They also seek to restrict the number of apprentices. The members of the Builders' Federation have already discharged 50 per cent. of the masons in their employment, and in the event of the strike not being settled soon they threaten to lock out the whole of the masons in the federated districts. The Federation, which has only recently been formed, includes the master builders of Liverpool, Manchester, Accrington, Ashton-under-Lyne, Birkenhead, Blackburn, Blackpool, Bolton, Burnley, Bury, Chorley, Darwen, Lancaster, Leyland, Longridge, Morecambe, Oldham, Preston, Radcliffe, Rochdale, Stockport, Wallasey, Warrington, and other towns.

NEWPORT, MON.—A further complication in the building trades dispute at Newport occurred on Saturday when the members of the Society of Plasterers stopped work. The ground of cessation is that the men object to imported non-society men being employed.

NUNEATON.—The local branch of the Amalgamated Society of Carpenters and Joiners have come to an understanding with a majority of the employers in that town, whereby the standard rate of wages from next October till 1900 will be 8d. per hour.

ULVERSTON. — The whole of the wallers in Ulverston, numbering over 40, have struck work after a week's notice, the masters having refused to concede an advance of 1d. per hour. The employers have offered an advance of ½d., but this has not been accepted.

CHIPS.

The Tottenham School Board have again deferred consideration of the plans selected for the new offices. The Board have decided to advertise for tenders for building new schools at Woodlands Park, and to readvertise for tenders for building Glasgow Alexandra schools.

The foundation-stone of the Leather Department of the Yorkshire College, at Leeds, was laid on Monday. The new buildings will contain, on the ground floor, a laboratory fitted with machinery for leather finishing, and workrooms for tanning and dyeing. On the first floor there will be research and bacteriological laboratories, and the second floor will contain store-rooms and drying accommodation, and probably a museum. The architects are Messrs. Alfred Waterhouse and Sons.

Mr. J. L Redfern, Hanley, has been appointed deputy city surveyor of Carlisle.

Mr. Mould, the Newington librarian, is getting together an exhibition of the works of George Tinworth, the sculptor, who, it will be remembered, was born in Walworth.

At the first meeting of the newly-elected Strand District Board of Works, Mr. G. Rees proposed the re-election as chairman of Mr. Walter Emden, J.P., P.S.A., whose courtesy, impartiality, and dignified conduct in the chair during the past twelve months, he remarked, were appreciated by all his colleagues, who were also sensible of the very valuable services rendered to the board by the professional skill and knowledge of that gentleman as an architect and surveyor. Mr. Dunscombe seconded the resolution, which was supported by Mr. Gamble and Mr. Cox, the latter remarking that Mr. Emden had devoted more time to the business of the board than any other member connected with it. The resolution was carried unanimously.

Col. Arthur Clifford Alexander, R.E., late colonial engineer and surveyor-general of the Straits Settlements, died on the 9th inst. at Rosemeath, Rushbrooke, Co. Cork, aged 54 years.

The Cowlyd Water Board, at their last meeting, held at Colwyn Bay, appointed Mr. T. T. Marks, C.E., as consulting engineer, in the illness of Mr. T. B. Farrington, C.E.

The Duke of Devonshire will visit Manchester on Wednesday next, the 22nd inst., to open the new Christie Library at Owens College, and to lay the foundation stone of the Whitworth Hall.

A large music-hall in Dewsbury, known as Harte's Amphitheatre, was totally destroyed by fire on Sunday. It gave sitting accommodation for 2,000 persons, and should have been sold by auction on the following Wednesday for the benefit of the creditors.

At Tuesday's meeting of the Birmingham City Council, the Lord Mayor submitted the recommendation of the General Purposes Committee as to the purchase by the council of the undertaking of the Birmingham Electric Supply Company (Limited) at the price of £420,000, and authorising the committee to take the necessary steps for the promotion of a Bill in Parliament to authorise the purchase. There was no opposition to the scheme and the recommendation was agreed to.

The corner-stone of the English church at Lucerne was laid, on Tuesday, by Mr. F. R. St. John, minister-plenipotentiary at Berne. The edifice is being erected from the designs of Mr. F. R. Farrow, F.R.I.B.A., of the firm of Colson, Farrow, and Nisbett, architects, Winchester and London.

Colonel W. R. Slacke, an inspector of the Local Government Board, held an inquiry at the Institute, King's Heath, on Friday, in reference to an application of the King's Norton Rural District Council for sanction to borrow £1,350, for the purchase of land as the site of a new depot and stores.

A new board school at Snape, near Pickering, was opened on the 9th inst. The school accommodates 75 scholars, and has been built to plans by Mr. C. H. Channon, architect, of Malton, at a cost of between £700 and £800. Mr. Martindale, of Pickering, was the contractor. A new school is also to be built for Pickering, at an estimated cost of £1,500.

The freehold ground-rent of £282 per annum secured on the premises occupied by Messrs. Doulton and Co. till 1939 was sold by Messrs. Arber, Rutter, and Waghorn by auction on Friday, for the sum of £16,000, to the British Empire Mutual Life Assurance Company. This represents over 73 years' purchase, and pays 1⅝ per cent.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2268.
FRIDAY, JUNE 24, 1898

COMPETITION DESIGNS FOR FEVER HOSPITAL AT CARSHALTON.

THE three designs that have been chosen by Mr. Henry Currey, F.R.I.B.A., the assessor, as entitled to the premiums of £150, £100, and £50 respectively, for the proposed fever hospital at Carshalton, now on view at the offices of the Metropolitan Asylums Board, show three different arrangements of the sets of isolated cottages or pavilions with the staff accommodation attached. The ten competing architects who submitted designs had to conform to several conditions. No fewer than 720 patients had to be distributed in 30 double cottages for 24 patients each, or 12 in one cottage, and these had to be arranged in groups so that five double cottages were under one sub-matron. Each double cottage had to provide for one separation room for two beds, and the space for each patient in the dormitories was to give 920c.ft., or not less than 96sq.ft., allowing 80ft. wall-space to each bed. In the day-rooms 60sq.ft. floor-space had to be provided. A bedroom for house mother, a scullery, safe for food, linen-cupboard, recess for brooms, and bath and ablution-room were required for each of the cottages.

In addition, an adjacent building to each five cottages, for the staff, was to contain a sub-matron's sitting and bedroom, &c., a sitting and mess-room for three night-assistants, and seven maids' rooms, and cubicles, &c. Isolation wards for 80 cases with 44 beds and separate wards for 36 beds; also administrative block, containing the usual rooms for medical officers, superintendent, dispensary stores, and kitchen offices and matron's and servants' quarters had to be embraced; and provision was to be made for laundry and houses for medical superintendent, steward, engineer's workshops, &c.

The plans marked with letter "A," by Messrs. Treadwell and Martin, which have been awarded the first premium, is on the *échelon* principle. The thirty double cottages are arranged along three rows of covered corridors placed obliquely to a central axial corridor running north and south. The north end is terminated by the central administrative block, five double cottages are placed along one of the six *échelon* corridors which run from the centre stem, and these have each the day-rooms with north and south windows, with two return wings or dormitories with windows east and west, the two airing-courts being between, so that the walls are freely exposed to sunshine, also the airing courts, but sheltered from north and east. The staff blocks are attached to each group or corridor of five cottages. Looking at the plans of each pair of cottages, which are ⊔-shaped, we find the authors have fairly complied with the requirements, the two day-rooms at each end of the main block with its own entrance and scullery, lighted on both sides; each is 36ft. by 20ft., and in the centre is the separation room, with distinct entrance, 20ft. by 13ft. for two beds, and lighted by windows at both ends. On the airing-yard side a covered verandah runs along the south side of day rooms. At the end of each pair is a house-mother's room and linen-closet. Inclosing the airing-courts on two sides are the dormitories, each for 12 beds, 50ft. by 20ft., or six beds on each side. The bath, ablution-rooms, &c., are isolated, and project at the north end of each cottage. An alternative plan shows two-story cottages, L-shaped; the day-rooms are at the ends of each wing, 36ft. by 20ft., lighted by good bay windows; at the corner is the entrance-hall, stairs, and scullery, with a separation-room, 26ft. by 13ft., for each cottage. Above, the dormitories, 50ft. by 20ft., have six beds on each side, with windows between, a house-mother's room, and to each is an isolated bath, lavatory, &c., projecting from each ward. We prefer the first plan. The alternative plan shows the cottages arranged along three parallel corridors. The isolation blocks in both are placed at the south end of the central corridor. The administration block at the north end has long corridors and lacks compactness and concentration. The elevations are simply treated and effective, brick being used with a little variety in the outlines of roof and parapet.

The second selected set of plans, "I," by Messrs. Pennington and Sons, Norfolk-street, adopt a segmental distribution of cottages. Four lines of covered corridors, with radial or cross corridors, give access to the three groups of ten cottages. The slight curve adopted gives a very desirable amount of sunlight to the first group on the eastern end, the dormitories and day-rooms facing to a large extent south-east. The day-rooms are at the ends lighted by large bay windows, and each room is 36ft. by 20ft., with entrance, scullery, bath, and mother's room convenient to each dormitory of 12 beds, which measures 43ft. by 20ft. These dormitories are end to end, and connect the end wings or day-room blocks. On the north side, isolated and ventilated, is the bath and closets block, and on the south side the separation room for two beds. As these blocks are between the dormitories, they are available for both. The arrangement is simple and probably less costly than the other designs. Each block of double cottages forms an elongated ⊢⊣ in shape.

The third plan, "J" (Messrs. Newman and Newman, of Tooley-street) is more elaborate in arrangement. The authors' scheme shows a sort of amphitheatrical plan round a centre garden. The lines of corridors form a large semicircle on the eastern side of site, round which are four lines of parallel corridors with radiating ones dividing into three groups, connecting them. The double cottages are placed axially north and south between these corridors, so that the dormitories of each pair-block get the full sunlight on the east and west walls. In the centre is a garden with water-tower, and the administration offices are in a line with it on the west side, and the isolation block on the east side. The staff blocks are placed in connection with each group and within easy access. The plan of each double cottage shows a day-room 31ft. by 23ft. with bay window, with mother's room attached at each end, with dormitories axially end to end between. The arrangement of separation room and closets and lavatories, semi-detached, resemble the last described; the dormitories are well lighted on both sides between the beds; the entrance to each cottage is at the extreme end, with a scullery, bathroom, and other necessary requirements. The plan for isolation pavilion shows a ward 36ft. by 22ft. for six beds, with verandah, and the nurses' rooms are convenient. The alternative scheme is less satisfactory. The isolation pavilions are to provide 44 beds—34 beds for families and children, and 10 for men, and separate wards for 36 beds distributed for a different number of beds. Each has to have a floor space of 156ft. super., or 12ft. wall-space. The authors of these plans appear from our general examination of them to have conformed to the requirements of the managers. The blocks are well isolated and exposed to sunlight and air; the airing courts are, in one set at least, well protected from north and east winds. The design placed first is certainly treated in a plain and substantial manner without unnecessary features.

MODEL SPECIFICATIONS.—XVIII.

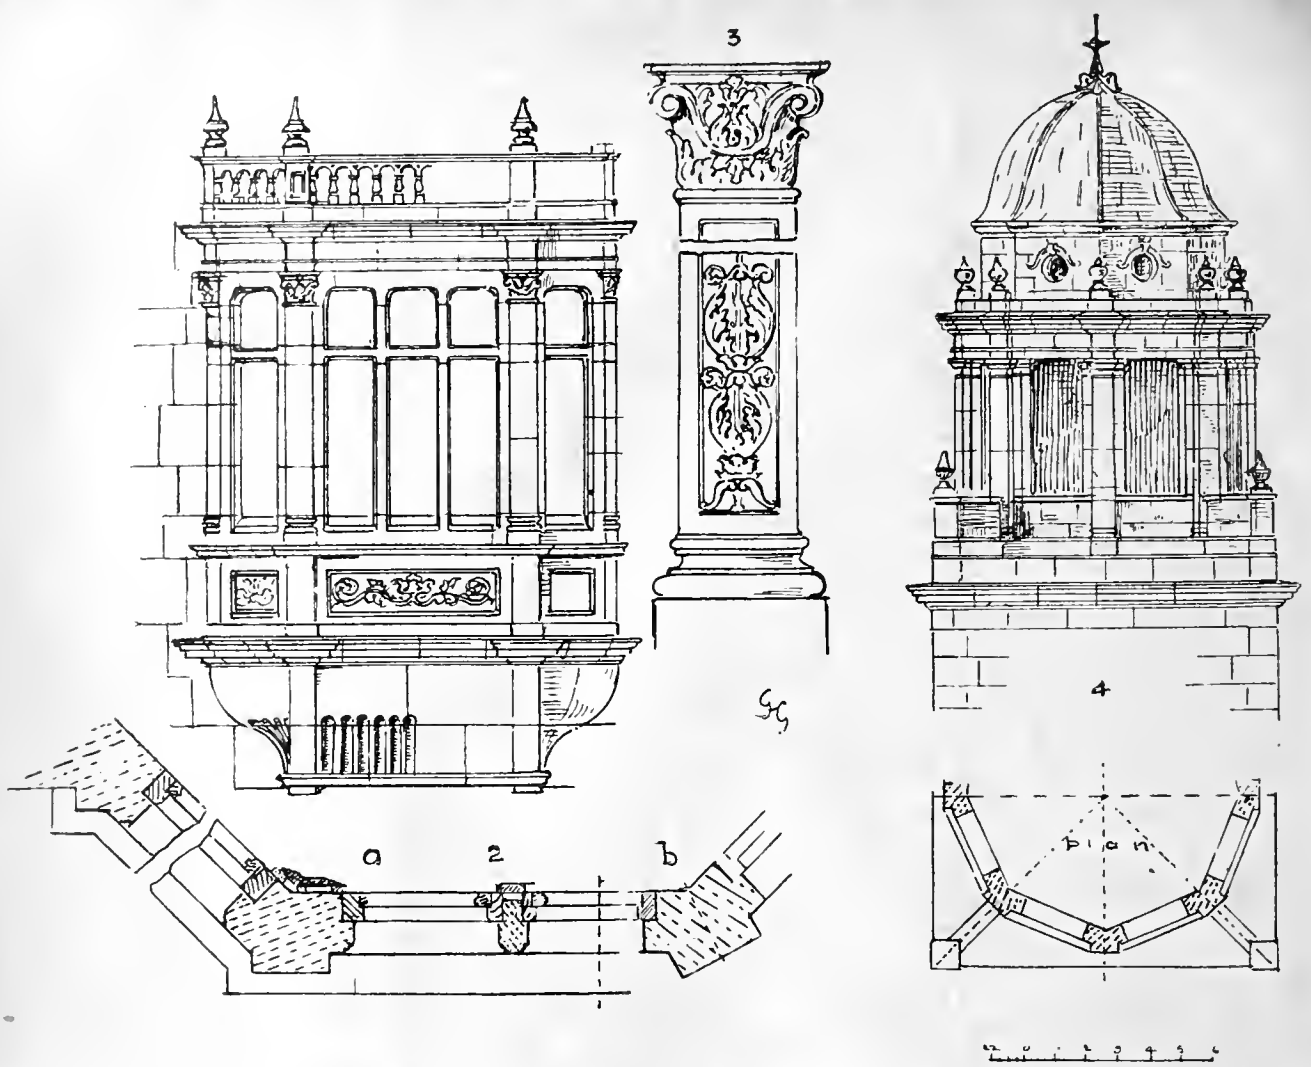
MASON.

IN our present article we give examples and clauses for several features of stone buildings that are not often dealt with. Take, for instance, a stone bay window—the builder is generally referred to the contract drawings or detail; but unless these are carefully figured, much is left to the mason. The ordinary bay window angle mullion is sometimes cut out of slab stone, and put together very much like a boxed marble fire-place jamb with vertical joints; or the mullions 4½in. thick, are sawn out of a solid stone, and made to appear as if they were solid. We are alluding to the common mode adopted by speculative villa-builders. The only proper mode of working them is to treat them as solid mullions or pilasters, each piece being cut out of the solid prism of stone, and to sink the splayed or return faces and reveal, and to form rebate for frames.

The mullions ought to be dowelled to the sill with copper or slate dowels, and each length ought to be fixed in the same manner and bedded or pointed in stone-dust mortar. The extreme dimensions of angle mullions ought to be given if a large-scale detail is not supplied. The transoms, also the bonding of the jambs, how the beds are to be worked, and the heights of each stone should be specified. Gothic mullions are seldom described as they ought to be. The size of finished mullions, their height, if moulded or chamfered, whether to show fair inside, and whether they are to be glazed with lead lights, with grooves or rebates for the same, or if to be rebated for iron frames are points to be named. We give a few clauses for these. For bay windows, the angle mullions may be worked as shown, either as *a* or *b*; the latter shows the pilaster placed anglewise between the two faces. If the pilaster is carved on face or panelled only, it should be shown by a sketch or detail, Fig. 3, and referred to. One important point is the jointing of sills. Unless they are very carefully bedded, the slightest settlement of jambs or mullions will cause them to crack, if in one long piece. To avoid this, the vertical joints of long sills should be placed beneath the mullions or in line with the reveals, if possible. Though a joint in the centre of a light is objected to, it is often seen in old buildings.

The practical construction of stone domes has received less attention than the theory, and there are few textbooks or precedents for specifications, and the architect often refers to this item in a very general and inadequate manner. We shall give a clause or two. The stones of the several courses should be worked with accurate beds and joints from properly set out full-size drawings, the templates for the bed-mould and joint-mould of each stone in every course being correctly prepared. The details should show the number of courses, and particular care is necessary to break the vertical joints, and to cramp the stones, or dowel them. If the dome is large, or a lantern surmounts it, provision should be made for iron bond or linked bars, at the springing of the dome. We illustrate, Fig. 4, a lantern and cupola of dressed stone as an example. We also give a few sketches for Gothic work. The examples of mullions and jambs (Figs. 5 and 6) one plain splayed, the other moulded, with the plane of mullions recessed, are commonly met with. The other figures (7 and 8) illustrate bases for Gothic buildings, and a gable showing how the "springers," "kneelers," and apex stones are worked.

44. *Two-Light Window, Moulded and Carved* (see sketch 4, p. 841).—The two (or three) light windows of ground story to have moulded sills, architraves, and mullions, as shown in detail. The side jambs or architraves to be moulded according to section, to be in one double sunk-faced stone, 15in. in width by 12in. in thickness or bed (or be in two stones), and to be three or four courses of ashlar in height, bonded to wall



and dowelled to sill, and to have head to match. The centre mullion (see sketch) to be worked out of a stone 7in. (or 8in.) by 5in. in section, extreme dimensions, with moulded base, panelled pedestal and pilaster, and capital out of two blocks (or one). The base to be dowelled with slate or copper to the seating of sill, and the capital to be dowelled to the transom; the upper mullion above to be a carved baluster, also dowelled to head, and both to be rebated for wooden frame. Or—

The window to project, with the two projecting mullions moulded as shown, and to be worked as pilasters plain (or panelled and carved) in one (or two) stones, rebated to wooden frame, with recessed mullions and transom, and entablature over. The mullions to be dowelled to seatings of sill, and the beds to be arranged every three (or more) courses of ashlar and well bonded to wall.

45. *Bay Windows.*—The jambs and mullions to be of selected Portland (Bath or other) stone, and to be executed according to detail. Each face of mullion to be 9in. (or 12in.) with 4½in. (or 6in.) reveals, wrought out of solid blocks of the whole height (or in two or three pieces) rebated (or state if frames to be moulded on edge or otherwise enriched). There are to be no vertical joints; the upper and lower end of mullions to be dowelled with slate (or copper) dowels to seating of sill and window heads. Or—

The bay window to be constructed, as shown (see sketch 1), on two courses of moulded corbelling with returned ends bonded into wall. The stones to be in one (or two or more) lengths, the lower course tailed or pinned into wall at least 9in., and to be cramped together (if of several stones) with slate dovetail cramps 10in. long (or dowelled), with the lower face enriched by channels or flutings. The cornice (12in. by 6in.) and carved dado over to be as shown, the cornice dowelled to the upper course of corbel; the dado, 6in. thick, dowelled to base, and to have carved panels. The sill to be 12in. by 6in., moulded on outer edge mitred round mullions, sunk, weathered, and throated with stools left for mullions. These are to form pilasters carved on face, and to be worked out of solid stones 13in. by 10in. in two (or three) pieces; each pilaster to have a moulded base and carved capital; the sunk panel enrichment to be modelled to the architect's approval. Each pilaster to be secured by metal dowels to the sill and head, and these, as well as the entablature, are to be bonded to the wall. The mullions to be formed in two pieces, dowelled to the transom, sill, and head. The cornice to be mitred as shown over pilasters, and to be surmounted by a plinth, balustrading, and capping, according to details, with all necessary lead plugs, dowels, and cramps.

46. *Turrets.*—The turrets to be built of Portland stone in courses to bond with ashlar (rubble or brickwork) breaking joints on solid stone corbels in three (or four) courses, the lower course to tail into wall at least 12in. (or 18in.); (if necessary the stones in each course to be cramped with copper cramps, 12in. long and 2in. by ¼in.), run with lead.

47. *Lanterns and Cupolas.*—The turrets to be crowned with lanterns (or cupolas) of stone (see sketch), worked fair inside and outside, and the stones to be dowelled (or cramped) together with copper dowels (or cramps), run with lead or sulphur. Or—

The turrets to have conical roofs or cappings of five or more courses of wrought stone, the upper course worked out of solid stone, with level and true beds dowelled together with copper dowels (or each course to be plugged with lead at the joints), the shafts and finials to be secured by copper spindles, 1½in. diameter. Or—

48. *Stair Turrets.*—The circular (or octagonal) stair turrets to be constructed of solid stone blocks, worked to level beds and square joints, breaking joint; worked fair inside of the dimensions figured on plans with solid spiral steps of tooled Yorkshire or rubbed hard Portland, solid winders 6in. thick, with the outer ends pinned into the walls 6in. as the work proceeds in cement, with solid stone newel at the centre (give outside dimensions of each step). At each course of the turret (or every third course) the stones to be cramped together by copper (or galvanised iron) cramps run in with lead, each cramp to be 12in. or 15in. in length and 2in. by ½in., and each bed to be dowelled with square slate dowels. Or—

48. *Circular Stair.*—The circular winding staircase to be of rubbed hard York stone, winders 6in. thick, with arris taken off, and to be 21in. in the clear. The newel to be worked out of each step solid (6in.) diameter, the other end pinned into turret walls 6in. in cement as the work proceeds. The landings to be 6in. thick with solid newel worked on. Put a handrail of barrel iron 2in. in diameter, with flush screwed joints upon bracket supports fixed to walls at regular intervals screwed to handrail.

49. *Copings.*—The copings to gables to be of rectangular section, chamfered and throated on lower edge (see sketch 7), and to be 13in. by 4in. (or 6in.) thick, with apex stones, kneelers, and corbels as shown, bonded into the wall. The lengths of stones to be not less than 3ft. or 5ft., except the kneelers, and the coping to be bedded and jointed in cement, and cramped (if necessary) with copper cramps 9in. long, run with lead or with Spence's metal, sulphur, or cement. Or—

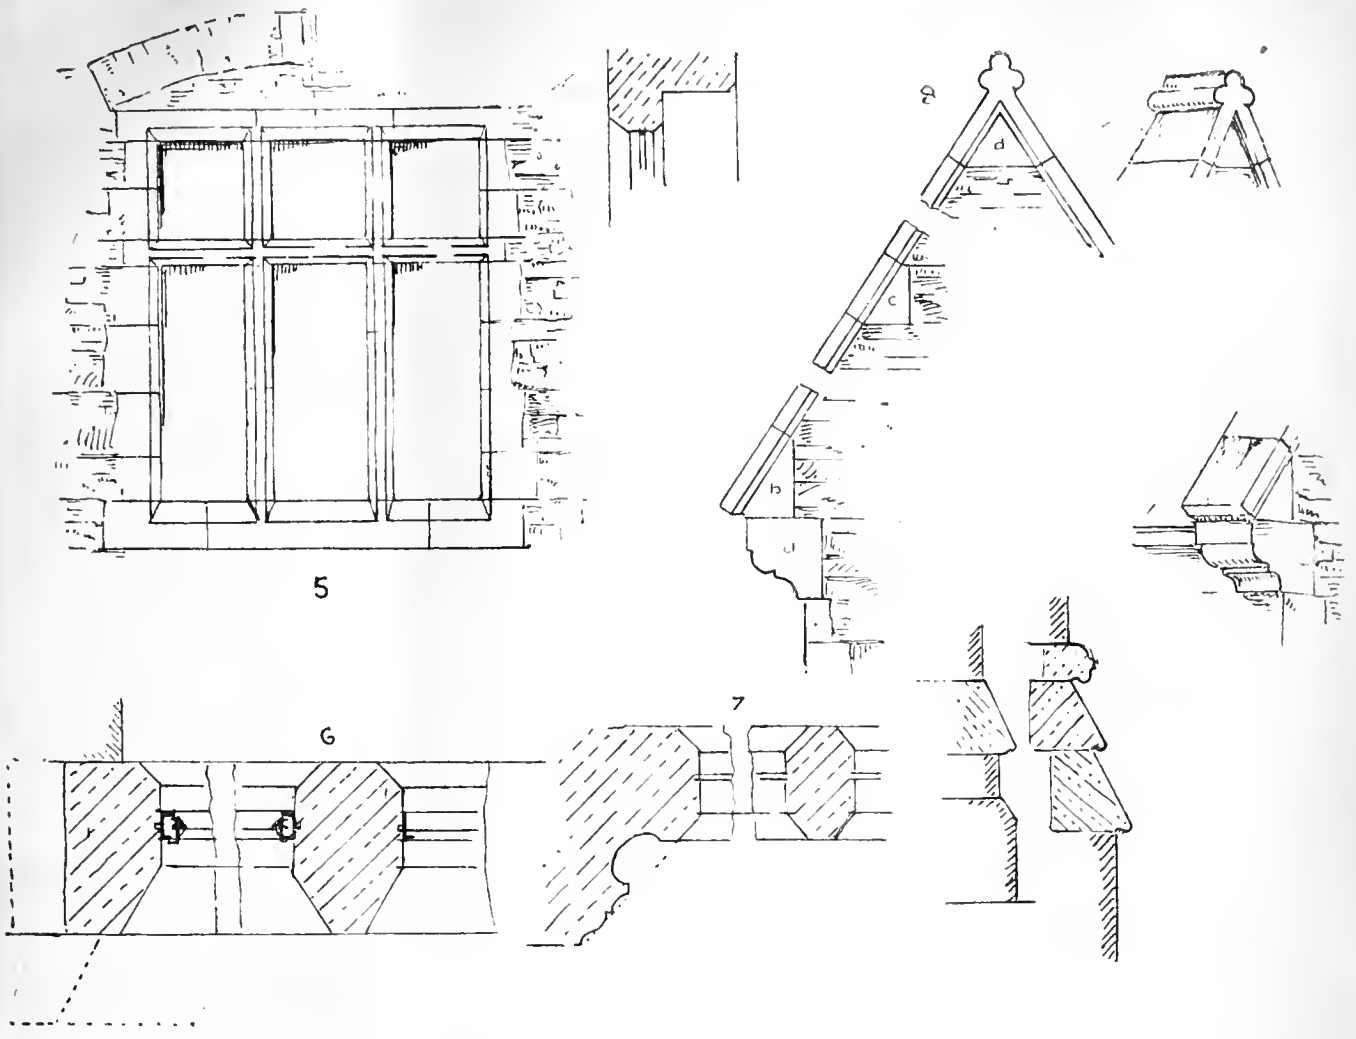
The copings to the gables to be saddle-backed, and to be cut out of stone 13in. (or 16in.) by 13in. (or more) in scantling, and of lengths not less than 3ft, bedded and jointed in cement, plugged (or dowelled) with lead (or slate in cement), and bedded and jointed in cement. Or—

50. *Balustrade Coping.*—The coping of balustrading to terrace to be of the section shown, a moulded saddle-back 12in. by 12in. (or 14in. square), the stones to be not less than 4ft. or 5ft. long, dowelled (or plugged) with lead, the joints being arranged to fall at the mitres of pedestals and over balusters. Mortises for slate (or copper) dowels to be made over each baluster.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

PRESENTATION OF THE ROYAL GOLD MEDAL.

THE meeting-room of the Institute of Architects at 9, Conduit-street, was thronged by ladies in evening attire and by members on Monday evening, the occasion being the formal presentation of the Royal Gold Medal for the year to Professor George Aitchison, R.A., who has just been elected President for a third year of office. On the walls of the room were hung many architectural drawings and schemes of decoration, illustrating works carried out by Mr. Aitchison, and a series of photographic portraits of the Gold Medallists of past years in frames of varying



character had also been brought together, and added to the interest of the display. As is customary on these occasions, Messrs. Penrose and Brooks and the other Gold Medallists present wore their medals suspended round the neck by a broad dark blue ribbon, and the President, who occupied the chair, assumed, in addition to the massive gold chain and badge of office given to the Institute by the late Professor Donaldson, the Diamond Jubilee medal conferred upon him last year.

MR. WILLIAM EMERSON, hon. secretary, briefly opened the proceedings, stating the object of the meeting, and called upon MR. F. C. PENROSE, F.R.S., LL.D., ex-President, to make the formal presentation. Mr. Penrose, in the course of a graceful speech, remarked that it was perhaps well that the person who undertook the duty of investing the recipient of this honour should be independent of the body who made the selection of the name to be presented to her Majesty. He wished to show, he said, how fully the Council had been justified, both on architectural and literary grounds, in the choice they had made. Their President's father was an architect, and appeared to have destined him for the profession from the very first. Mr. G. Aitchison, senior, up to the time of his death, was architect to the St. Katharine's Dock Company. His practice was mainly in wharves, warehouses, and offices, and structural alterations on a large scale, and he built the road stations on the London and Birmingham Railway. Their President was educated at the Merchant Taylors' School until his sixteenth year, when he was articled to his father, and during his pupilage attended the science and art classes at Somerset House, where the late Mr. J. R. Herbert, R.A., was then master. In 1847 he became a student of the Royal Academy, and, after the completion of his articles, took the degree of B.A. at the University of London, in 1851, whilst continuing his architectural training in his father's office. In January, 1853, he travelled through France, and thence through Italy. Returning to Rome, he made valuable friendships with the artists assembled there in that year, 1853—*viz.*, G. H. Mason, the idyllic painter, by whom he was introduced to two future Presidents of the Royal Academy, Leighton and Sir Edward Poynter; and he also met Alfred Waterhouse and William Burges. Leaving Rome after the Holy Week of 1854, he travelled in company with Burges to Arezzo, Perugia, and Assisi, where they stayed some weeks, making notes and sketches of the important fresco decorations of Cimabue and Giotto in the church of San Francisco. Thence they went to Florence, where they stayed several months, making notes and taking sketches and measurements of some of the palaces and other monuments: then continuing their studies at Siena, Pisa, Lucca, and Pistoja. They proceeded *via* Leghorn to Marseilles, and visited Lyons, Beaume, Dijon, and Troyes together, where they sketched and measured ruins. The two friends then separated, and Aitchison met his parents at Paris, and with them returned to Italy, coming home to London in the summer of 1855. He then became his father's head clerk, and was taken into partnership with him in 1859. During this partnership he saw a great deal of work of an engineering character on the Chester and Holyhead Railway. In June, 1861, his father died, and he began practice on his own account, becoming architect to the St. Katharine's Dock Company. He was engaged chiefly on large massive works—wharves, warehouses, and suites of offices—but was enabled occasionally to introduce architecturally-designed fronts and staircases. The tobacco warehouse and offices and other warehouses for the Victoria Docks had a frontage of 500ft., by 170ft. in depth, costing £65,000. Messrs. Hubbuck's warehouse on the Thames has some architectural character. In 1865 he built Lord Leighton's house, to which the glass house, the Arab hall, and picture gallery were subsequently added; and he also designed the ornamental furniture of the house. Other works by the President include Berkeley Square, No. 1, South Audley-street, 9, Chesterfield-gardens, 52, Prince's-gate, and 1, Grosvenor-avenue. In 1869 he altered and decorated the hall and staircase at 44, Belgrave-square, for the Hon. Percy Wyndham, for which paintings in combination were made by Leighton; and this led to his being employed in decorative work for the Princess Louise at Kensington Palace, for the Duke of Montrose, Lord Leconfield, Sir W. Lawson, Sir S. Waterlow, Mr. Eustace Smith, M.P., Mr. John Aird, M.P., Mr. J. H. Renton, and many others. In 1868 he built the new board-room for the Thames Conservancy, designing also the furniture, whilst Leighton modelled the frieze of the board-room. In 1871 he altered and enlarged the house of Mr. F. Lehman, M.P., 15, Berkeley-square, and designed the furniture. In 1884 a house for Mr. J. Stewart Hodgson, which had been left unfinished by the death of his friend F. P. Cockerell, was put into his hands to complete. For the same owner he also made large additions to his house at Lythe Hill, designed the fittings, and decorated the rooms. In 1877-78 he rebuilt Founders' Hall, and in 1886 the Royal Exchange Assurance Offices in Pall Mall, and in 1892 decorated in colour the Livery Hall of the Goldsmiths' Company. He designed the decorations for the British Art Section at the Paris Exhibition of 1878. He had been, Mr. Penrose added, elected a member of the *Société Centrale* of French architects, and also of that of Belgium, was a foreign Associate of the Royal Academy of Belgium, and had received numerous medals from our own colonial associations in recognition of his claims as an architect. In 1881 he was elected Associate of the Royal Academy, and in that position gave occasional lectures, but, since being chosen Professor of Architecture in 1887, he had given his lectures annually. To his architectural he had added much good literary work. He wrote the Science and Art Syllabus on the "Principles of Ornament." He edited, and partially rewrote, Ward's "Principles of Ornament" in 1892, and four years later added an Appendix on the Orders. He was a contributor to the "National Biographical Dictionary," and one of the examiners in the Science and Art Department at South Kensington. In conclusion, Mr. Penrose referred in high terms to the character of the Academy Lectures given by Professor Aitchison, observing

that they were calculated to encourage architectural students to keep before their eyes a high ideal of architecture as an art, based on sound construction, technical knowledge, and true principles of design as its essential aim. Mr. Penrose proceeded, amid loud and continued applause, to invest the President with the riband and medal.

Professor AITCHISON, who commenced his remarks hesitatingly and in very low tones, being obviously embarrassed, returned thanks for the honour conferred upon him—the greatest, he observed, that England could bestow upon an architect. The most cherished desire he had was, he said, to see English architecture come to the front, and erect masterpieces which should epitomise the grand thoughts of the day and give them a character which should attract mankind. When he looked at Westminster, Salisbury, York, Peterborough, and Lincoln, he could not think that our ancestors, the architects of those minsters, fell greatly below the designers of the most renowned cathedrals of Europe. He could not believe our nature could have sunk so much below the standard of our semi-barbarous forefathers of the 13th century as to be incapable of developing the architecture we had into a true presentment of the highest aspiration and the ideal beauty of our time. It must be because we had got into a wrong groove, and we must get out of it before architecture ever again became a progressive art and could equal or surpass the glorious masterpieces of the past. The Renaissance men got architecture out of the way of progress by casting themselves at the feet of the Romans, and proclaiming that Roman architecture was perfection and could not be surpassed, although they did some noble and some beautiful work; ever since all the architects of Christendom have only attempted to paraphrase some deceased architecture. No one could deny that architecture was the poetry of arrangement and construction, and we needed to have these at our finger ends before we could hope to progress, so that when the heaven-born genius came he would have his tools ready. Arrangement and construction alone would not give us all we want, or else the marvellous works in iron of the engineers would have given it to us. We had to study the methods of expression that the masters of our art had employed, to learn how we might express our thoughts in our own climate; and we must, too, of necessity have change and novelty; different times, different surroundings, and different circumstances begot a different frame of mind. He would suggest three fields in which our architecture might well be vastly improved: in the care taken with its mouldings, the study given to proportion, and a striving after freer use of colour.

Mr. ALEXANDER MURRAY, in expressing the thanks of the meeting to Mr. Penrose for his appreciative remarks, and to the President for his charming response, referred to the valuable help Mr. Aitchison had frequently and freely given the authorities of the Classical Department at the British Museum in the classification and arrangement of fragments of Greek sculpture and architecture.

The PRESIDENT announced that on Monday next a special business meeting would be held to further consider the revised schedule of professional charges, and evoked laughter and applause by inviting in the same tones visitors and members to partake of refreshments in the adjoining room.

THE PROPOSED CENTRAL STREET FROM HOLBORN TO THE STRAND.

THE Improvements Committee of the London County Council have submitted to that body a fresh scheme for the construction of a main thoroughfare from Holborn to the Strand. Various projects for piercing a street from north to south through central London have been formulated during the past nine years, and in 1892 one was presented to Parliament; but hitherto no proposition has met with approval or has ever passed the initial stage, although the need for such a means of communication becomes year by year increasingly urgent. The present scheme, as will be seen by the accompanying map, is to carry a new road, 100ft. wide, from a point in Holborn immediately opposite Southampton-row directly towards the Strand. The new thoroughfare will absorb the eastern side of Little Queen-street and proceed a little to the west of Lincoln's Inn-fields in a southerly direction, intersecting Great Queen-street, Sardinia-street, Vere-street, and Stanhope street. Thus far, the scheme is practically the same as that proposed in 1892, 1895, and 1896; but at Stanhope-street, instead of continuing in a direct line to the Strand, the street bifurcates. The western branch, as wide as the main street (100ft.), passes in a south-westerly direction, crossing Drury-lane, and entering Catherine-street and the Strand close to Wellington-street, cutting through the *Echo* office and the Gaiety Theatre opposite, so as to form an approach to Waterloo Bridge. The eastern branch, also of the same width as the main street, passes from Stanhope-street through New Inn to the Strand at St. Clement Danes Church. The scheme also provides for the widening of the Strand for a considerable distance on the north side of St. Mary's Church, and for the acquisition of the whole of the site within the area bounded by the Strand and the two branch streets, taking for this purpose the publishing offices of the Strand Newspaper Company, Limited. The main street, and also its two branches, which will be almost semicircular and symmetrical, will be 100ft. wide.

The scheme provides for the retention of the church of St. Mary-le-Strand, as the committee consider that the church to a large extent acquires its peculiar dignity and beauty from its present position in the Strand. On a former occasion, when it was suggested that the Council should cause the church to be removed, the proposal was received by the public with indignation. Moreover, the several powerful architectural societies in London strongly urge the Council to insure the retention of the building. The Council's superintending architect, Mr. Blashill, has called attention to the unfortunate result, from an architectural point of view, that would be produced by the removal of the church, and he has expressed the opinion that it is a fine and very meritorious building belonging to a good period of English architecture, and a highly picturesque object in all views of the Strand, and he considers that by its removal that thoroughfare would lose the chief feature of interest which it at present contains. The committee share this view, and have therefore arranged for the setting back of the frontage on the north side of the church, by which a good road will be provided to accommodate the traffic passing eastwards.

The scheme now proposed, however, will, the committee believe, provide a handsome architectural termination to the new avenue, for the whole of the triangular space (nearly four acres) between the Strand and the two branch streets will form one of the most central positions in London, and the architectural effect of the buildings which will be erected upon the site, will, when regarded in concert with the Law Courts, the flanking garden, and the two churches, constitute one of the finest street views in London.

London has suffered materially in the past from the fact that when main thoroughfares have been constructed too little consideration has been placed upon the value of architectural effect. A grand feature at the southern end of the new avenue, such as that which will be obtained by the buildings to which reference has been made, will not only confer dignity and beauty upon the thoroughfare, but will undoubtedly tend to enhance its importance, with the result that the sites fronting the new street will be increased in value, to the great profit of the Council, and therefore of the ratepayers. Moreover, from the enhanced value of those sites, it will necessarily follow that the buildings to be erected will be proportionately more handsome than would otherwise be the case, and the proximity of the edifices at the southern end of the main street will lead to the erection of structures at all parts of the avenue of perhaps equal architectural beauty. The committee therefore consider that, in the present instance, a bold scheme will prove to be the truest economy.

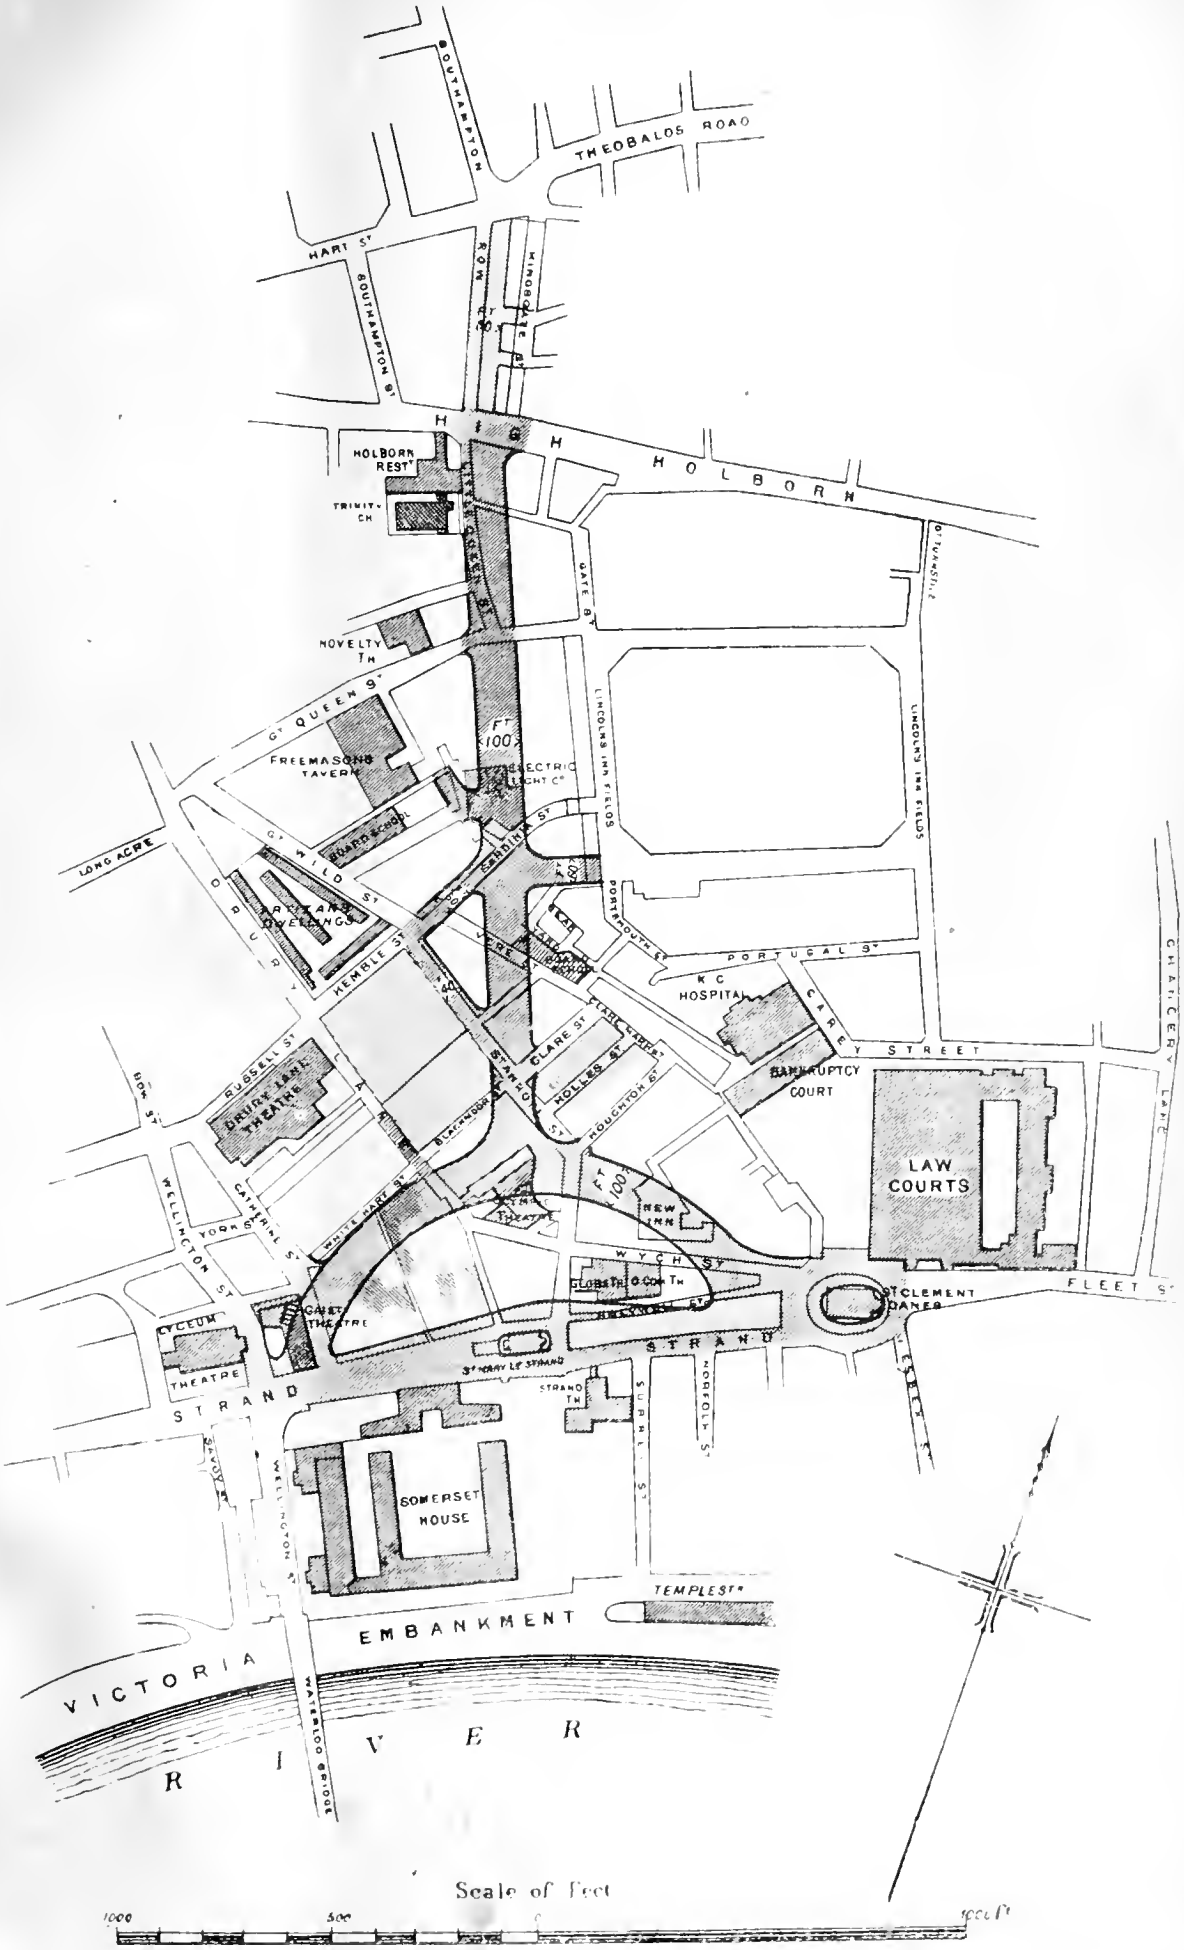
The committee's estimate of the net cost of the new street is astonishingly low, due to the fact that the properties to be acquired are chiefly of a very poor character, while sites in such a main thoroughfare will possess very great value. Powers will be sought to apply "betterment" to the properties which will be enhanced in value by, but will not be acquired for, the improvement.

The estimate of the chief engineer for the streets, subway, sewers, paving, &c., is £120,000. The estimate of the valuer for the acquisition of the property required for the whole improvement amounts, after deducting recoupment, to £354,200. The estimated net cost of land needed for providing accommodation for the persons of the labouring class to be displaced is £150,000. The total estimated net cost for the whole scheme is, therefore, £624,200, which represents about three-sixteenths of a penny in the pound on the rates for the first year after the commencement of the improvement. This estimate will be somewhat reduced by the receipts from levying an "improvement charge" on properties benefited by the new route. The estimated net cost of the necessary property is put at £354,200. The gross cost is estimated at £4,442,500, and the recoupment at no less a sum than £4,088,300. The first charge on the rates will not accrue until three or four years hence. Powers for the improvement cannot be obtained until July, 1889, after which about two years will doubtless be occupied in the making of the initial valuation for the improvement charge, the formulation of a scheme for rehousing the displaced persons of the labouring classes, and the receipt of claims consequent upon the service of notice to treat.

A part of the district, in the line of the new street, consists of insanitary courts and alleys; in fact, some of the worst in London, with houses only fit to be pulled down. The clearance of these must, the committee holds, result in an incalculable amount of good. Perhaps the worst of them are those in the vicinity of Clare-street, Stanhope-street, and White Hart-street, and these are now being dealt with by the Council, under the powers conferred by the Housing Acts, the areas having been formally represented as unhealthy areas by the medical officer of health for the district. The formation of the new thoroughfare and the subsidiary streets now proposed will displace about 3,030 persons of the labouring class, in addition to those displaced from the Clare Market area. In connection with the Clare Market rehousing scheme accommodation is to be provided in the immediate locality for 750 persons, but no account can be taken of that accommodation in considering the question of rehousing the 3,030 persons to be displaced by the new street. Of these 3,030 persons about 500 (including in each case the families of the workmen) are dependent upon occupations in the immediate locality, involving exceptional hours—*i.e.*, early attendance in the morning and late attendance at night. These persons must be accommodated on the cleared land adjacent to the improvement; but this can be done without erecting any artisans' dwellings immediately on the frontage of the new street—a contingency which it is very desirable to avoid. About 410 persons are dependent upon employment in the locality not involving exceptional hours, and suitable accommodation for these persons and also for 840 more—*i.e.*, about 1,250 in all—may perhaps be provided on the Millbank prison site, now in the possession of the Council. With regard to the remaining 1,280 persons, equivalent accommodation may be provided in a convenient locality in the suburbs. The net cost of providing land for the erection of dwellings to accommodate the 3,030 persons to be displaced is estimated at £150,000. We may mention that the Millbank site will accommodate about 4,400 persons of the labouring class. A portion of the site has been appropriated for the housing of 1,500 persons to be displaced by the Clare-market scheme. There remains, therefore, sufficient land to accommodate about 2,900 persons. The cost of appropriating land adjacent to the new street for the purpose of providing accommodation would be more than thirty times greater than if land at Millbank were utilised for the purpose.

The present scheme has the advantage of providing for easy gradients. The gradient of the proposed thoroughfare will at no part exceed 1 in 50, and will be that in the branch streets only. The gradient of several streets descending into the Strand is at present steeper than 1 in 30. The gradient of the main street will be about 1 in 100. In the scheme submitted to the council in July, 1892, it was proposed to form about midway between Holborn and Strand, and on the site of Sardinia-street and Vere-street, a circus at least 200ft. in diameter; but this circus has been omitted from the present scheme. The new street, being 100ft. wide, will afford ample space for a double line of tramways along its centre, besides fully providing for other traffic on either side; and the committee recommend that powers should be sought in the Bill for laying tramways along the new street. It may be possible later to extend the tramways along Southampton-row to the north, and also to the existing tramway in Theobald's-road and Clerkenwell-road to the east.

One of the most important features of the



PROPOSED THOROUGHFARE FROM THE STRAND TO HOLBORN.

scheme is that it will form a direct line of communication from the districts north of Holborn to the Embankment. The new street will deliver the traffic almost opposite to Norfolk-street and Arundel-street, and will thus afford easy access to the Temple Station, the School Board Offices, and the Embankment towards Blackfriars Bridge. It has been suggested to the committee that their scheme to be complete should provide for an extension of the proposed new street by means of a bridge across the Thames between Waterloo Bridge and Blackfriars Bridge. But this question does not fall within the reference, the provision of such a bridge being a matter for the consideration of the Bridges Committee, and the Improvements Committee have therefore thought it right to do no more than arrange that the line of the new street shall be such as will easily lend itself to any possible future extension of the street by means of a bridge across the river.

The committee point out that the widening of Southampton-row, in a direct line northwards from the new street, to 60ft. is in progress under arrangements by voluntary agreement made with the Duke of Bedford; while another feature of previous schemes, the removal of the "island" block of buildings between Holywell-street and the Strand, is about to be carried out under Parliamentary powers obtained by the County Council last session, a valuer having been nominated within the past fortnight; further, the insanitary areas between Clare Market and Drury-lane are about to be cleared and rebuilt under the authority of the Home Office and Parliament. The latter improvement suggests that if the street is to be formed at all, the necessary Parliamentary powers should be obtained without delay.

The aggregate cost of the improvements contemplated in this district will be as follows:—(1) Strand widening at Holywell-street, £569,000; (2) clearance of insanitary district at Clare Market and Drury-lane, £216,000; (3) Southampton-row widening, £162,000; (4) proposed new street from Holborn to Strand, £624,000; making a total of £1,571,000. This, compared with the estimate of 1892 for the same general scheme (£2,246,000) shows a difference of £675,000. It should be explained that this large reduction is due in part to the much better development of the surplus land resulting from the modification of the scheme of 1892 by the two branches to Wellington-street and the Law Courts, and in part to the economical arrangement made in the purchase of the Southampton-row property.

The committee say, in conclusion: "It seems to us that the arguments in favour of carrying out this great improvement at once are overwhelmingly strong. It is quite certain that delay even for one year will add enormously to the cost of the new road. It will also entail other inconveniences in respect of the laying out of the area to be cleared by the Housing Committee. The three improvements already in hand in this district will be immensely enhanced in value by the completion of the whole scheme in the making of the new road. It is certain that in no other part of central London could so great an improvement be effected so advantageously and at so small a cost. Streets 100ft. wide will be made for a length of more than 3,000ft., through one of the worse districts of London, opening up a much-needed communication between north and south, and between Holborn and the Strand, and offering great opportunities for architectural features. It will be an improvement of which the Council and London will have every reason to be proud."

The recommendations submitted are as follows: (*a*) That the Council do apply to Parliament in the session of 1899 for powers to construct a new street, and branch streets, 100ft. wide, from Holborn to the Strand, and to carry out the subsidiary street improvements in general accordance with the scheme shown on the plan approved by the Improvements Committee on May 25, 1898. (*b*) That the question of powers being sought to enable the Council to lay tramways along the new street be referred to the Highways Committee for consideration and report. (*c*) That provision be made for the construction of a subway under the new streets (for mains, wires, &c.), and also for the planting of trees in the new thoroughfares. (*d*) That provision be made in the Bill for part of the cost of the improvement to be dealt with on the same general principle as that embodied in the improvement charge sections of the London County Council (Tower Bridge Southern Approach) Act, 1895, but that a longer period than three years be allowed within which to judge of the effect of the improvement upon the surrounding property. (*e*) That it be referred to the Housing of the Working Classes Committee to consider and report the best mode of rehousing the persons of the labouring class who will be displaced by the construction of the new street and its approaches.

The Improvements Committee of the London County Council have also resolved to recommend the Council to include the following schemes of public improvement in the Improvements Bill to be introduced by the Council next session:—High-street, Kensington, widening, estimated cost £81,000; Wandsworth-road, Lambeth, widening between Vauxhall Cross and Nine Elms-lane, £55,000; rebuilding of Cat-and-Mutton Bridge, Shoreditch, £68,500; rebuilding of the Old Gravel-lane Bridge, St. George's-in-the East, £14,000. The total estimated cost of six contemplated improvements, without deducting contributions, is £1,004,700; and after deducting contributions, but not betterment, £955,700.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XXV.

By AN ASSOC. INST. ELECT. ENGS.

ARC-LIGHTING.

INTRODUCTION AND HISTORICAL NOTES.—Arc-lighting is a system of producing light artificially by reason of the manifestation of the heat evolved by the passage of electricity through conductors of high resistance (concentrated at those points where light is desired); it is, however, quite distinct from that of raising a conductor to incandescence, as in incandescent lighting. In the incandescent system a conductor is raised to incandescence without combustion or consumption of the conductor taking place, whilst in arc-lighting combustion, disintegration, and consumption of the conductor are the natural products of the system. In the former air is excluded from the lamp, whilst in the latter air is essential for the proper working of the lamp, especially at the beginning. The principle of the arc-lighting system may be briefly stated as follows: When a sufficiently high difference of potential is maintained at the ends of two carbon rods in contact with one another, a powerful current passes through them, and, inasmuch as the resistance at the junction of the loose carbon contacts is very high, a temperature sufficiently intense to vapourise the carbon is produced at this point, so that upon gradually separating the carbon-pencils to a distance of, say, $\frac{1}{8}$in., a bridge of carbonaceous vapour is produced, and a dazzling arc of white flame is formed between them. This phenomenon was discovered by Sir Humphry Davy, and was by him termed the *electric arc*. The date of this discovery is usually given as about 1809; but in September, 1800, Davy announced that "he was able to produce sparks that were visible in daylight from the discharge of a primitive voltaic pile; and he found, in trying sparks between terminals of different materials, that these sparks were of different degrees of brightness. Amongst other materials that he names, he mentions that the bright spark visible in daylight was obtained by using well-burnt charcoal." In 1810, Davy demonstrated at the Royal Institution that he was able to produce permanent arcs by means of a battery of 2,000 elements; this battery was obtained by private subscription. Respecting his early experiments, in which he used two pieces of light wood charcoal about an inch long and one-sixth of an inch in diameter, we are told that when these "were brought near each other a bright spark was produced, and more than half the volume of the charcoal became ignited to whiteness; and, by withdrawing the points from each other, a constant discharge took place through the heated air in a space equal, at least, to four inches, producing a most brilliant ascending arc of light, broad and conical in form in the middle."

The temperature was so intense that even refractory materials placed in the arc "became incandescent: platinum melted like wax in the flame of a candle; sapphire, magnesia, lime, and the most refractory substances were fused. Fragments of diamond and granite rapidly disappeared without undergoing any previous fusion." At this point we may refer to the origin of the term *arc*. In the early experiments of Davy the charcoal pencils were fixed horizontally, in which case the bridge of glowing carbonaceous vapour formed an arch or bow as the result of the ascending heated air current; and the abbreviation of arch, or *arc*, then introduced has been retained. With the vertical position, as now usually given to the carbons, the bow or arch shape is not produced.

As would be expected, the discovery of the electric arc attracted the attention of numerous workers, and in course of time many improvements were suggested; but until the dynamo was perfected as a generator, little or no practical progress was made in electric lighting. The work done was experimental, and at that time the only source of electrical energy was the voltaic cell, which is not suitable or economical for commercial purposes. The follow are additional interesting historical facts. About 1844 Foucault definitely proposed the use of pencils of retort carbon, and in 1846 Mr. William Edward Staite introduced the first mechanical arc lamp. Probably the first real practical arc lamp, in which the regulation was automatic and electrical, was that designed by Serrin in 1857; but it was not until 1878 that Brush and Jablochkoff introduced the arc lamp for street-lighting. Since then its growth, especially in America, has been rapid.

Arc Lamps.—We are now in a position to consider the arc lamp, and the phenomenon of the electric arc in detail. An arc lamp is a piece of apparatus devised to support two carbon rods or pencils, and to automatically regulate the position of these carbons, so that a permanent and steady arc is formed when the lamp is supplied with electrical energy. The operations which such a device has to perform are as follows:—(1) To bring the carbon pencils into contact when no current is passing; (2) to separate the carbons a definite amount, or *strike the arc*, as it is technically termed, as soon as the current passes; and (3) to regulate automatically the length of the gap between the carbon points by causing the pencils to approach when too far apart, and to separate them when too close; this is technically known as *feeding the arc*. Innumerable methods have been devised to perform these operations, and presently we shall refer to the fundamental principles of arc-lamp mechanism; but before doing so we must consider the carbons and the physics of the arc. For the present our remarks will only refer to continuous-current arc lamps.

When we remember that the difference of potential usually applied to the terminals of an arc lamp is not sufficiently high to cause sparks to pass from one pencil to the other, it is obvious that the light emitted from an arc lamp must be produced by the passage of electricity across the gap which is filled with a gaseous conducting medium, due to the volatilisation of the positive carbon. And it is now generally admitted and well understood that this volatilisation enables us to explain the phenomenon of the arc. There is, for instance, the transportation of the intensely heated carbonaceous vapour across the gap, resulting in the formation of a crater at the tip of the positive carbon. Moreover, it is at the surface of the crater that the electrical energy is converted into thermal and light energy, and the work done in this locality by the dissipation of a definite amount of electrical activity results in the production of a corresponding definite high temperature. As is well known, carbon is the most refractory of known substances, and it has, therefore, the highest temperature of volatilisation. Furthermore, this temperature is fixed and definite, depending only upon the material used, and the result is an incandescent luminous crater forming a glowing white surface, in which carbon is being boiled into vapour at the temperature of volatilisation. Captain Abney has shown by his researches that the white light of the incandescent surface of the crater is of constant quality and luminosity, irrespective of the magnitude of the current, size of the carbons, and length of the arc. This constancy in the intrinsic luminosity of the crater surface implies that its temperature is fixed by physical conditions, and that the temperature of the light-emitting surface is always the same. It is for these reasons that the view—that the temperature of the carbon at the surface of the crater is that at which it evaporates—receives so much support. Increase of electrical activity, therefore, cannot increase the temperature of the crater surface beyond the limiting temperature of volatilisation of the material used. There is also evidence that the carbon undergoes incipient liquefaction just before volatilisation takes place, as was first suggested by Despretz about 1850, and Professor S. P. Thompson's view of the

physical state of the arc crater is "that the solid carbon below is covered with a layer or film of liquid carbon just boiling or evaporating off." Much speculation has existed as to the actual temperature of the arc, extravagant temperatures, varying from 2,000° to 10,000° C. having been quoted. The best experimental result is probably that obtained by Violle, whose measurements indicate a temperature of 3,500° C. as that of the crater.

Since the crater of the positive carbon is the main source of light, the positive carbon, with its luminous crater, is always placed above the negative carbon, so that the light is thrown downwards. "About 90 per cent. of the light comes from the crater, and about 4 or 5 per cent. from the negative peak, while comparatively little comes from any other part. Around the rim of the crater there is, however, a region that is less luminous, not so hot, and of a redder colour; and there is a certain small percentage of light—not more than 3 or 4 per cent. of the total light at most—emitted from the intermediate flame. Now, of course, there results from this a peculiar distribution of light in the space all round; the light is, in fact, thrown mainly downwards." The negative carbon must of necessity be at a high temperature, but much below that of the positive, consequently it adds little to the general illumination—in fact, its temperature is such that it permits the condensation of the carbonaceous vapour upon its

FIG. 86.

surface. So long as the arc is maintained oxidation takes place, and the ends of both carbons become somewhat conical in shape. The appearance of the carbons is shown in Fig. 86.

What the carbon filament is to the glow-lamp so the crater and carbonaceous vapour are to the arc lamp—i.e., the essential elements. For these we have to depend upon the carbon pencils; and to insure the production of that high-quality illumination which is so desirable, the carbon pencils should possess certain essential qualities. As we have already pointed out, everything depends upon the temperature of volatilisation of the carbon, and to secure the requisite constancy of this temperature the pencils should possess a uniform and dense texture, fine grain, freedom from impurities, and be well baked. They should also be of uniform cross-section. The want of uniformity or the presence of impurities produces variation in the volatilisation, and consequently variation of temperature at the crater surface. And all this simply means variation in the intensity of the light emitted. Even in his early experiments Davy found "that to render charcoal well-conducting and satisfactory, it must be hard, dense, well burnt so as to be metallic in lustre, and that it answered best of all if it were suddenly quenched in quicksilver." Fleming gives the following reasons why carbon (graphite) is suitable for the pencils of an arc lamp.

(1) It is a rather poor conductor of electricity, and the lower the electrical conductivity the greater is the difference of temperature between the positive and negative poles when an arc is produced between them. It has also the advantage of having a highly heated crater on the positive pole.

(2) It is easily disintegrated; therefore there will be a longer arc for a given electrical pressure.

(3) It is very infusible, and its oxide is a gas; therefore a deposit of oxide is not formed in or around the crater.

(4) It is an inferior conductor for heat; therefore the high temperature is localised at the crater.

It is also noteworthy that the degree of

FIG. 87.

infusibility decides the intensity of the electrical pressure required to produce a true electrical arc.

Manufacture of Arc Light Carbons.—Charcoal, even if well burnt, is speedily consumed, as Davy found to be the case during the early experimental stage, and although the blocks sawn from the hard deposits of gas retort carbon (graphite), as introduced by Foucault, answered well during the later experimental stages, it was found necessary to introduce a definite process of manufacture when the arc lamp was introduced for commercial purposes. Considerable difference exists in the different processes of manufacture; but these are in matters of detail, and the following may be taken as a general outline of the manufacture of arc-lamp carbons.

The base in nearly all cases is graphite or retort carbon, which is thoroughly pulverised (although in some cases powdered coke is used), and the powdered carbonaceous substance is mixed with gas-tar, syrup of sugar-cane, or some other carbonaceous liquid, so as to form a stiff paste. The paste is then moulded or forced by hydraulic pressure through a die-plate, and after being dried it undergoes the carbonising process by being baked in a closed vessel in a furnace. During this process the carbonaceous compounds are decomposed, and a fairly pure form of carbon is produced. To insure purity, homogeneousness, electrical conductivity, a dense and uniform molecular texture, the rods are often repeatedly soaked in some carbonaceous syrup, and rebaked each time. To give some idea of the actual composition of the paste we may state that Carre's carbons are made of pure coke fine powdered, 15 parts; calcined lampblack, 5 parts; special syrup, 7 to 8 parts; and after the mixture has received from 1 to 3 parts of water, and a perfect paste is formed, it is ready to be moulded.

In many cases the carbons are electrolytically

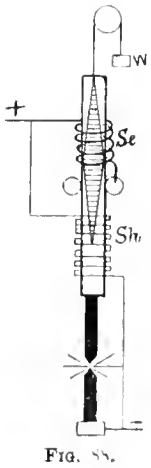


FIG. 88.

coated with a deposit of metallic copper to insure more perfect conductivity, better contact at the holder, and more uniform consumption. In the earlier days of manufacture it was more necessary to plate the carbon with copper than it is now, when the quality of the carbons is so much better. Even when coated with copper it is often found that the position of the arc is not constant, and inasmuch as the steadiness of the arc depends largely upon this, the positive carbon is made larger and cored. That is, the central portion is made of softer material, which, being more readily volatilised, tends to keep the crater central. Cored carbons to a large extent prevent the lateral shifting of the arc, and steadiness in burning is secured. The negative carbon of continuous-current arc lamps are, however, not cored, whilst in alternate-current arc lamps both carbons are cored.

In some respects English practice differs from that of America. In America arc lamps are usually connected in series, the carbons being equal in cross-section, and solid throughout. With a current of 10 ampères the length of the arc is about one-tenth of an inch. In England, parallel running is more common, and the positive carbon is usually cored, and larger than the negative. The usual length of the arc is from one sixteenth to one-twelfth of an inch. The usual sizes of carbons—positive cored and negative soled—for different currents, are as follows:—

Current in Ampères.	Diameters in Millimètres.	
	Cored Positive.	Soled Negative.
5 and 6	9	9
8	11	9
10	13	11
15	15	13
20	18	15
30	20	18

At this point it will be interesting to note that when the quantity of illumination required is large and somewhat variable, as in lighthouse work, round carbons are not so suitable as fluted ones. They burn irregularly, and the position of the crater is unsteady when the currents are large, and they are liable to become red-hot throughout their length when traversed by the heavy currents required. Fluted carbons, however, offer larger cooling surface than cylindrical ones, and, if cored, tend to keep the arc central. At the South Foreland Lighthouse the fluted carbons are about 60 millimètres in outside diameter, and the current, which is alternating, varies from 180 to 300 ampères, according to atmospheric conditions. The section of a fluted carbon is shown in Fig. 87.

Since the carbon pencils disintegrate and burn away, the lasting power of the carbons is an important factor. Generally speaking, the time of burning varies directly as the diameter, and, with continuous currents and both carbons of the same diameter, the positive wastes away twice as fast as the negative. In ordinary 10-ampère lamps the positive carbons burn at the rate of 1½in. per hour—that is, 1ft. of positive and 6in. of negative last about eight hours. Of course, much depends upon the quality and character of the carbon, the strength of current, and the size of pencils. If the carbons are too thick they give less light per watt, but give a steadier light and possess more lasting power. If too thin they give brighter light and more light per watt, but the craters are not so good, and the pencils tend to get hot, and so burn away more quickly. In practice it is found that the crater reflects most light when the axis of the negative carbon is in line with the edge of the positive carbon.

Arc Lamp Mechanism.—The gradual disintegration and consumption of the carbons, which take place whilst the lamp is burning, would result in the gradual elongation and ultimate extinction of the arc, if the carbons were fixed relatively to one another. It is, therefore, obvious that, inasmuch as variation in the length of the arc means unsteadiness of illumination, some automatic regulation is required to keep the pencils the proper distance apart, and as we have already pointed out, arc lamps are now constructed to bring the carbons into contact at the beginning, to strike the arc, and also to feed the arc. Generally the regulation is controlled by a portion of the electrical energy supplied.

The construction of a perfect arc lamp offers much scope for ingenuity, advantage of which has been freely taken by many inventors, and numerous examples of both mechanical and electrical regulation have been devised. In many of the early lamps the regulation was purely mechanical, and comprised various kinds of clockwork, racks, brake-wheels, clutches, levers, &c. Taken as a whole, such mechanism is objectionable, and not nearly so reliable as that of

electrical control, and we find in consequence that modern arc-lamp mechanism is purely electrical. In nearly all cases advantage is taken of the electro-magnetic action of solenoids, electro-magnets, and motors as sources of power to give the required motions to the carbon pencils. For many reasons electrically governed arc lamps are preferable to those governed mechanically, and although many of the mechanical arrangements devised are very interesting, our purpose will best be served by considering only the principles applied in the modern and electrically governed

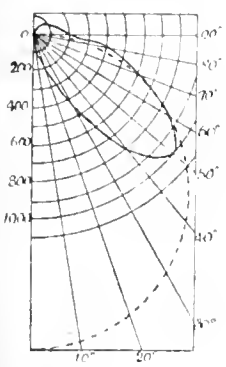

FIG. 89.

lamps. By reason of the antagonistic effects produced by two distinct and separate coils or electro-magnets, the majority of modern arc lamps may be termed *differential* lamps, the action of which will be readily understood by considering Figs. 88—91.

These more or less diagrammatic figures are given to show how two continuous opposing forces may be produced. Fig. 88 shows the concentric winding of the two coils, which are traversed by currents in opposite directions. Fig. 89 shows how to produce differential motion with one plunger, whilst Fig. 90 shows how differential motion is produced by means of two plungers attached to one lever or connected by means of an intermediate pulley. It will be noticed that in each case there are two coils, S *e* and S *h*, the former of which, known as the *series* coil, consists of a few turns of thick wire having a resistance of about 0·05 ohm, and as it forms part of the main circuit by being connected in

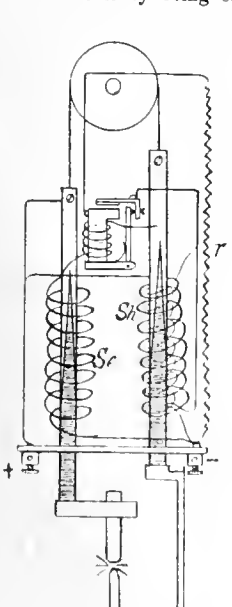

FIG. 90.

series with the arc, it is traversed by the main current. The other coil, marked S *h*, is wound with many turns of fine wire, its resistance being great in comparison with that of the series coil. It is connected, as shown, in parallel with the main part of the lamp—*i.e.*, series coil and arc—and is therefore known as the *shunt* coil.

To explain the action of these coils, we shall assume that the carbons are in contact at the time the lamp is supplied with current at the proper voltage (from 40 to 50 volts), and since there are two paths open to the current, one of large resistance compared with that of the other, it is evident that nearly the whole of the current will traverse the series coil, in consequence of which the electromagnetic action of that coil will be great. The holder of the positive carbon then moves upwards, and, the carbons being separated the proper amount, an arc is established between them; in other words, the arc is struck. As the carbons burn away, the resistance of the arc, and, therefore, that of the main circuit, increases, so that more current now passes through the shunt coil, its magnetic properties are strengthened, and, acting in opposition to the series coil, the carbons are made to approach each other. In this way the length of the arc is automatically maintained constant, the arrangement being designed so that a steady feed exactly equal to the rate of consumption of the carbons is obtained.

As we have already inferred, there are two general methods of connecting arc lamps in practice: (1) in series, and (2) in parallel between leads. Lamps for series-working are constant-current lamps, and those for parallel-running constant potential lamps. The latter differ from the former in that they require a steadying resistance coil, R, connected in series with the main circuit. This coil is shown in Fig. 91. Its function is two-fold: it regulates the difference of potential required for the lamp and at the same time steadies the current. Constant difference of potential lamps without this resistance coil work unsatisfactorily, as then the current fluctuates with every variation in the resistance of the arc. With the resistance coil, the voltage at the terminals of the shunt coil increases as the

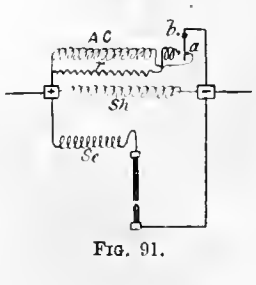

FIG. 91.

resistance of the arc increases, and its regulation is more effective. Constant-potential arc lamps are usually connected two in series across incandescent lamp mains at 110 volts. This series coil is not so necessary with constant current lamps, a large number of which are connected in series, since they tend to steady one another. When lamps are connected in series, it is usual to employ an additional piece of mechanism, termed an *automatic cut out*, so as to provide a by-pass, as it were, for the purpose of preventing the opening of the entire circuit, should the failure or total consumption of, or accident to, the carbons of any one lamp put that lamp out of circuit. Such a device is shown in Fig. 91, and is marked A C. The automatic cut-out is practically a relay, and consists essentially of an electro-magnet and its armature, *a*, pivoted at *b*, as shown. The electro-magnet is wound with a fine wire and a coarse wire winding, the former of which is connected as a shunt to the lamp, and as it is connected to the armature, and thus to the negative terminal of the lamp, it is always in circuit; but as its resistance is high, very little current flows through it; normally it is not powerful enough, under ordinary circumstances, to attract the armature. When, however, the main current through the carbons is interrupted, the increase of current through this coil magnetises the core sufficiently to attract the armature *a* against the left-hand contact, the second, or thick wire coil of the cut-out is put into circuit, and as the armature still makes contact with the left-hand contact, the main current passes through, and thus shunts the lamp. In series with the low-resistance coil is the permanent resistance *r*, arranged so that the total resistance cut in is equal to that cut out.

The Candle-power of Arc Lamps.—The amount of light or candle-power emitted by an arc lamp is not given off uniformly in all directions, and the luminous rays form a cone with its apex at the crater. The amount of light therefore varies in different angular positions, the variations being due to the following circumstances:—

(1) The positive crater, the main source of light, is not a plane surface, but is concave; the principal distribution of its radiant flux is consequently downwards.

(2) The crater being surrounded by a wall of opaque carbon, the horizontal intensity of the emitted light is comparatively small, and, since the edges of the wall are irregular, the horizontal intensity varies in different azimuths.

(3) However closely the axis of the two carbon electrodes may be aligned, the arc will rarely remain long at the centre, but tends to travel around the edges of the positive carbons, thereby causing the crater to appear on the side of the arc, and tending to increase the illumination on that side.

(4) The arc is usually accompanied by some flame of a reddish colour surrounding the arc proper, like a luminous cloud, and the light from this source is of an unstable, flickering nature, shifting irregularly.

(5) Even the smallest mechanical irregularity or chemical impurities—liable to be present in the best carbons—develop fluctuations in the intensity of the light.

Photometrical measurements of the light of an arc lamp are not easy to make, and the results obtained are generally represented by a polar curve, constructed in polar co-ordinates representing the candle-power—that is, the intensities of illumination are represented by lengths plotted to some convenient scale along the angular directions at which the observations are made. The polar curve thus represents graphically the effective luminous intensities at different angular positions about the arc as an axis. Such a curve is given in Fig. 92.

All such curves exhibit the same characteristics, and there are two distinct types of variations: (1) there is the emission of a small quantity of light in a direction above the horizontal when the crater is deep, as with large current lamps; and (2) the curve narrows and indicates the concentration of a large proportion of the light between the angles of 30° and 60° with the vertical. "Now, the quantity of light emitted by an incandescent disc in any direction is proportional to the amount of surface visible from that direction. That is to say, candle-power varies, then, as the cosine of the inclination. Cosines plotted as a polar curve give a circle passing through the pole. The candle-power of the crater of an arc lamp should, then, if plotted as a polar curve, coincide with part of a circle. Any deviation from the circle must have some cause." The full curve given in Fig. 92 is given by Mr. A. P. Trotter, and "represents the mean of a large number of observations made, no less than 26 different arcs having been tested. The cosine of 60° being one half, the area of the crater seen from this direction is one half that of the full circle; the candle-power is one half of that emitted by the crater; and the length of the radius vector corresponding to 60° may be taken as the radius of the circle. The light due to the negative carbon is clearly shown as an excess above the circular curve. There is, indeed, nothing else to which it can be due, except the red-hot walls of the crater. At about 60° the curve of candle-power begins to fall off, and this is due to nothing else than the shadow of the lower carbon, which intercepts more and more of the light as we pass to smaller angles, until if the carbons be of the same diameter, no light is drawn in a vertical direction."

The *mean spherical candle-power* is defined as the average candle-power taken all over the surface of a sphere having the arc as its centre, and as a rule it is between 30 and 40 per cent. of the maximum candle-power. The mean spherical candle-power is given approximately by the formula—

$$S = \frac{H}{2} + \frac{M}{4},$$

where—

S = mean spherical intensity or candle-power,
H = ,, horizontal ,, ,, ,,
M = maximum ,, ,, ,,

And it may be shown that the total quantity of light emitted will be $4\pi S$, in units of luminous flux.

It is interesting to note that the quality of the illumination of an arc lamp is the nearest approach to that of the ordinary sunlight of any of the illuminants, whilst its intensity is greater than that of any other artificial source of light. Of course, much depends upon the character of the carbon, and, although the carbons may be cheap and have a long life, they are neither efficient nor economical if the light be unsteady

or of low candle-power per unit of electrical energy expended.

The following notes on street and general lighting, taken from Geipel and Kilgour's "Electrical Engineering Formula," will be useful:—"The horizontal surface is, perhaps, most important, and the illumination thereof varies closely as $\cos.^4\theta$, θ being the angle of incidence for angle greater than 45°. In order that the variation in illumination may not be too great, the distance of arc lamps apart should not exceed about six times the height, in which case, when

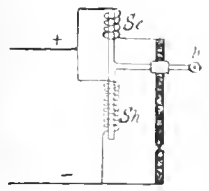

FIG. 92.

using 10-ampère lamps, the maximum illumination is about one candle-foot, and the minimum 0·06. If the distance is four times the height, then these figures are 1·1 and 0·22 respectively. Perhaps 0·03 candle foot is the lowest permissible illumination for a well-lit street. The table gives a few instances of the placing of arc lamps. It will be observed that for street-lighting the distance apart varies from about 115ft. to 300ft., and the height from 17·6ft. to 26·7ft.

—	Ampères per Arc.	Distance Apart in Feet.	Height of Arc in Feet.
City of London streets ..	10	115	17·6
Glasgow streets	10	160	18·0
Hastings streets	10	330	18·0
Berlin streets	15	137	26·7
Milan streets	—	80 to 100	25·0
Charing Cross-rd Statn.	10	90	18·0
Cannon-street Station ...	15	180	35·0
St. Pancras Station	10	60 to 80	14·0
Central Station, Glasgow	10	75	19·5
St. Enoch's Stn., Glasgow	10	90	—
Edinburgh Exhbtn., 1886	10	33	12·0
Edinburgh Exhbtn., 1886	15	41	18·0

Railway Lighting.—"The Midland Railway Company adopt the following practice with 10 ampère lamps:—

—	Distance Apart in Feet.	Height of Arc in Feet.
Platforms and booking-halls	60 to 90	14
Goods-sheds over decks	80	14
Goods-sheds over cartways & roads	80	18
Goods-yard, unloading roads	100 to 110	20
Goods-yard, ordinary sidings.....	120	20
Approach roads	120 to 150	25

When 7-ampère lamps are used, the distances are reduced by 10ft. to 15ft. Opalescent globes are used in sheds and stations, clear globes outside. About $\frac{1}{2}$-watt per square foot is a fair allowance for lighting large halls, exhibitions, &c.; 1 watt for large reading-rooms, libraries, &c.; 2 watts for intense illumination, such as is required at the South Kensington Museum."

"Globes of clear glass absorb 10 to 20 per cent. of light; mediæval rippled glass, about 22 per cent.; ground glass, 30 to 40 per cent.; heavily ground glass, 40 to 50 per cent.; and heavy opal glass 50 to 60 per cent. Large globes absorb more light than small ones."

In conclusion, we may note the following defects, and their causes:—

Sputtering is due to uncleanliness and impurities in the carbons.

Hissing is due to too coarse a grain, or too short a gap, in consequence of defective feed—*i.e.*, feed too rapid.

Flaming, flickering, and irregular burning are due to presence of impurities, insufficient baking, or too long a gap.

Inconstancy in the candle-power may be due to poor carbons, inconstancy in the rate of supply of energy, and variations in length of arc.

(*Concluded.*)

The Lord Lieutenant of Surrey, Viscount Midleton, has formally opened a cottage hospital and nurses' home for Haslemere, the gift of Mr. W. Penfold, F.R.I.B.A., and his sisters, as a permanent memorial of her Majesty's long reign.

ENGLISH ART IN THE EIGHTEENTH CENTURY.

AT the Passmore Edwards Settlement at Tavistock-place on Friday afternoon Mr. Humphrey Ward delivered the first of a series of four lectures on "English Art in the Eighteenth Century." He began by remarking upon the increased interest which had been directed during the last twenty years, both at home and abroad, to this art, the result in a great measure of the winter exhibitions at the Royal Academy and similar displays. The French were paying us the compliment of admiring our art, whether contemporary or distant, as something fine in itself and quite unlike their own. Meissonier was a passionate admirer of Millais, just as Delacroix had been of Constable and Bonington. It was natural that in this retrospective age we should look back upon the origins of our contemporary art, and, in point of fact, scholars had explored the 18th century with passionate curiosity, while rich amateurs had for many years past been eagerly competing with one another for the best English works of that time. It happened that there was in existence a little French book, Rouquet's "Etat des Arts en Angleterre," published in 1755, which showed that long before Delacroix there were foreigners who interested themselves in English art. Rouquet was an enameller who lived in London for about 30 years, and who was a friend and admirer of Hogarth. He remarks that English people had always cared more for science than for art: that there was no such thing as organisation among the artists of his day, and very little patronage: but that in two respects English art was showing signs of abundant life. The English loved portraiture, though only just beginning to produce portrait-painters of their own, and they loved the subjects with a moral which Hogarth had taught them to admire. The lecturer then proceeded to sketch the life of Hogarth, and to point out how in modern times the interest in Hogarth the moralist had declined, while that in Hogarth the artist had increased. He showed by various lantern slides some of the great qualities of that first of English painters, remarking that the sketch of "A Shrimp Girl" in the National Gallery placed him almost on a level with Frans Hals. From this point he proceeded to trace the various attempts that were made by the artists to organise themselves; their numerous failures, and their final success when Michael Moser, William Chambers, and Benjamin West persuaded the young King in 1768 to found the Royal Academy with Reynolds at its head. The second lecture, to be given this (Friday) afternoon, will be devoted to the life and works of Reynolds.

CHIPS.

Major-General H. D. Crozier, R.E., an inspector from the Local Government Board, held an inquiry yesterday (Thursday) into an application of the urban district council of Hunstanton for the borrowing of £3,000 for the purchase and improvement of the esplanade grounds for public walks and pleasure grounds.

The partnership hitherto subsisting between J. W. Falkner, W. J. Falkner, and A. B. Falkner, builder and contractors, Ossory-road, Old Kent-road, S.E., under the style of J. W. Falkner and Sons, has been dissolved, so far as regards W. J. Falkner.

The sub-committee of the Lord Provost's Committee of Edinburgh Town Council, to which has been remitted the question of selecting a site for the Usher Hall, decided on Monday by a majority to recommend a site at the extreme western corner of the West Meadows, in the angle between Lonsdale-terrace and the Melville Drive.

The Canals Protection (London) Bill, which gives power to the local authority to require a canal company to provide for the protection of dangerous places on canals in the county of London, passed through committee in the House of Lords on Tuesday with verbal amendments.

The parish church of Burnham Overy, Norfolk, was reopened last week, after restoration from plans by Mr. Herbert J. Green, Norwich. Mr. F. Norman, of Burnham Westgate, was the contractor.

It was announced on Saturday that the fund opened at Bristol five days previously on the appeal of the bishop for extending Church agencies and providing additional church buildings has already reached £12,000. Besides this, £7,000 has been given by one subscriber. This is to go in the purchase of sites. Twenty new churches, 14 mission buildings, and 30 extra curates are required, the sum necessary to carry out the scheme being £100,000.

OBITUARY.

BY the lamented death of Sir EDWARD BURNE-JONES English art loses one of its most brilliant colourists and one of its most imaginative poets in paint. With the possible exception of Mr. G. F. Watts, no artist held a higher place in the regard and affection of all lovers of English art than the distinguished painter who passed away on Sunday morning. His Classic subjects were treated with a Middle Italian feeling, and displayed withal much grace of line, a charm of composition, and a purity and wealth of colour all peculiarly his own, although it most be confessed his draughtsmanship of the human figure left much to be wished for. Edward Burne-Jones was born in Birmingham in 1833, and was thus 65 years of age. He was of Welsh descent. His parents intended that he should take orders in the Church of England, and his education at King Edward's school, Birmingham, was arranged to that end. He was an ardent classical student, and the old-world myths had ever for him an irresistible fascination. In 1852 he went to Oxford, and at Exeter College he met the late William Morris—who proved a kindred spirit; and the two having taken great interest in the "P.R.B." movement, determined to give up the Church and turn to art. With Rossetti for friend and teacher, Burne-Jones from 1865 devoted himself to the study of art. His first cartoons for stained glass were made for the chapel of Bradfield College in 1857. In 1859 Burne-Jones was in Italy visiting Florence, Pica, Siena, and other cities; and was greatly influenced by the tender charm of Angelico, Botticelli, and the earlier Italian artists. On his return he designed many stained-glass windows, and painted altar pieces and pictures. These included a series from the Morte d'Arthur, from Mallory's Romances, and "The Legends of Goode Women." In 1864 Mr. Burne-Jones was elected an Associate of the Water-Colour Society, and began the illustration of his friend William Morris's poem "The Earthly Paradise," and prepared some 70 designs for the story of "Cupid and Psyche," which were subsequently bought by Mr. Ruskin, and presented to the Oxford Museum. In 1870 he exhibited a picture with a mythical Greek subject. About its meaning a dispute arose, which led Mr. Burne-Jones to resign his membership, and it was not until 1888 that he was again re-elected. For seven years he ceased exhibiting in London, save in 1873, when to the Dudley Gallery he sent his beautiful pictures "Love among the Ruins" and "The Garden of the Hesperides." But he was during this period executing a series of beautiful works, "The Briar Rose" series, "The Days of Creation," "The Mirror of Venus," "The Beguiling of Merlin," "The Feast of Peleus," "The Golden Stairs," and his series in which the Virtues and the Graces were personified by charming single figures. When the Grosvenor Gallery opened in 1877 the works of Mr. Burne-Jones constituted the great attraction of the show, and to that gallery and to the New Gallery which succeeded it the best of his work was contributed. One of Sir Edward Burne-Jones's windows is in St. Giles' Cathedral, Edinburgh, the subject being "The Holy Women at the Tomb." Her Majesty conferred a baronetcy upon him in 1894. In 1885 the Royal Academy made what many thought a tardy recognition of Sir Edward Burne-Jones's position in English art by electing him an Associate at Burlington House; but the artist only once (in 1886) exhibited a picture called "The Depths of the Sea." In 1893 he resigned his connection with the Academy. The deceased baronet is survived by Lady Burne-Jones, and by his son and heir, Philip Burne-Jones, an artist also of recognised merit, and by one daughter. His body was cremated on Monday, and the ashes were buried at Rottingdean Church on Tuesday.

SIR JAMES NICHOLAS DOUGLASS, F.R.S., M.Inst.C.E., M.Inst.M.E., M.Inst.E.E., late engineer-in-chief to the Corporation of Trinity House, died at his residence of Bonchurch, Isle of Wight, on Sunday, in his 72nd year. Born at Bow, Middlesex, on October 16, 1826, the son of Mr. Nicholas Douglass, of Stella House, Penzance, he received a regular training in civil and mechanical engineering. His first important employment was in 1847 as assistant engineer to his father, who was superintending engineer to the Trinity House, and was then engaged in erecting the lighthouse on the Bishop, the westernmost of the Scilly rocks. Mr. Douglass, jun., was next appointed resident engineer in

sole charge at the erection of the lighthouse on the chief rock of the dangerous group of the Smalls, off Milford Haven. This work he completed at a cost of a little over £50,000, or about £15,800 below the lowest contract price. In 1862, on the death of Mr. James Walker, F.R.S., engineer-in-chief to the Trinity House, Mr. Douglass was appointed to succeed him. During his tenure of the post he carried out many important engineering works both at home and abroad, including the Wolf, Longships, Great and Little Basses, Eddystone, and Muricoy lighthouses, and he effected numerous technical improvements connected with lighthouses and their illuminating apparatus, as well as in buoys and beacons. On the completion of the present Eddystone lighthouse in 1882, a work he executed at a cost of £24,000 below the lowest contract price, he was knighted. Sir James Douglass was in favour of oil illuminants in lighthouses, for the development of which he devised a special apparatus. On the other hand, the Commissioners of Irish Lights, advised by the late Professor Tyndall, warmly approved the invention of an Irish gentleman named Wigham for facilitating the use of gas. A warm controversy arose upon the matter, and ultimately, in 1883, Professor Tyndall resigned his post of scientific adviser to the Trinity House and to the Board of Trade. Early in 1892 Sir J. N. Douglass retired from his post at the Trinity House owing to ill-health.

CHIPS.

A new mortuary has been erected at Lewisham, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

Mr. G. W. Willcocks, an inspector of the Local Government Board, attended at the town hall, Leamington, on Friday, to hold an inquiry in reference to the application of the corporation for permission to borrow £5,500 for works of water supply, and £5,010 for purposes of public walks and pleasure-grounds.

The members of the Lincolnshire and Nottinghamshire Architectural and Archæological Society visited the town of Lynn on Tuesday in last week. Next day they visited Hunstanton, Heacham, Snettisham, Dersingham, and Castle Rising. Returning to Lynn, they were served with dinner, after which the Mayor and Mayoress entertained them at a conversazione. Thursday was devoted to the churches in Lynn, and to a drive from Swaffham to Southacre and Castleacre.

At a general meeting of the Royal Institute of Painters in Water Colours, Piccadilly, held last week, the following were elected members:—Messrs. W. Lee Hankey, James S. Hill, John Pedder, G. Straton Ferrier, and J. Finnemore.

Mr. J. B. Dunn, of the firm of Dunn and Findlay, architects, Edinburgh, and Mr. George H. Law, of *The Scotsman*, sailed on Saturday in the Cunard steamer *Lucania* from Liverpool for New York, their object being to visit some of the chief newspaper offices and other buildings in the United States in connection with the preparation of the plans for the new offices of the *The Scotsman*, and the rebuilding of North Bridge-street and Market-street, Edinburgh.

It was announced at the meeting on Saturday of the National Union of Teachers that a site had been found at Wimbledon for the new orphanage which is to be built in the place of the one at Peckham. The ground will cost £4,300, which will be raised by the London Teachers, while Mr. J. Passmore Edwards has promised to provide the building at a cost of £5,000.

Up to the end of 1897 the total expenditure of the harbour works at Colombo, Ceylon, amounted to Rs.17,875,855, of which Rs.5,529,916 have been incurred on the two additional breakwaters commenced in 1894. Before the completion of the works, which comprise a graving dock and patent slip, a coaling depôt, and the three breakwaters inclosing a harbour of one square mile in extent, the total outlay is expected to reach Rs.2,500,000. The sterling debt of the colony on account of these harbour constructions will be £1,300,000. It will probably be 1902 before everything is finished.

The Floods Prevention Bill, which gives further powers to county councils with a view to the prevention of floods and other damage arising from rivers or water-courses, passed through committee in the House of Lords on Tuesday, with an amendment introduced on the motion of Lord Zouche of Haryngworth, providing that, in case of any injury done to the owner and occupier of land, or either of them, under the Act, full compensation should be made by the county council to both—that is to say, that one should not be compensated to the exclusion of the other.

COMPETITIONS.

CARSHALTON.—The Metropolitan Asylums Board, at their meeting on Saturday, received a report from their works committee stating that, as instructed by the Managers on June 19, 1897, they invited fifteen selected firms of architects to submit plans for certain portions of the Southern Hospital proposed to be built at Carshalton. Of these fifteen firms, ten only responded to the Managers' invitation, and sent in designs which the committee considered most creditable to the authors, and of great uniformity of merit. As the result of the examination of them, in which they had the assistance of the assessor, Mr. Henry Currey, F.R.I.B.A., they had selected three as most worthy, and recommended that "'premia' of £150, £100, and £50 be awarded respectively to the authors of the designs marked A, I, and J, this being the order of merit in which such plans have been placed." Mr. R. M. Hensley, chairman of the committee, in moving the adoption of the report, stated that the committee were unanimous in recommending that the premiated plans be placed in the order given in the report, and as the sealed envelopes had not been opened, and all designs were lettered in order of receipt, they did not yet know who were the authors of the successful plans. As to the probable outlay, plan A, the one placed first, was, according to the cubical contents of the buildings, likely to be the least expensive, although that fact had not influenced the assessor or the committee in their choice. Plan A cubed out at about five million cubic feet, and plans I and J at a little over six million cubic feet. The three premiated competitors all set different values on the work, the author of A having 7d. as a basis, I 8d., and J 9d. per cubic foot; but if they assessed the plans at a uniform rate of 8d. per foot, A would cost £169,000, I £200,000, and J £203,000. Even 8d. a cubic foot was, however, much too low a figure to select as a basis of cost; but if they raised it to 10d., the outlay would be £212,500 on A, about £250,000 for I, and some thousands of pounds more for J. To these figures must be added the architect's charges, engineering expenses, the making of roads, fences, and internal divisions, so that members need not be surprised if the final cost exceeded a quarter of a million. The hospital proper would probably cost £150,000. Mr. E. Monson, C.E., said he regarded the scheme as an entire waste of money, for no draughtsman at three guineas a week could have drawn up the plans for such a building. He did not approve of the plan by A, as the buildings were located too closely together, and the best site obtainable had not been selected. He moved that plan I be awarded the first premium. The amendment, not being seconded, fell to the ground. Replying to Mr. W. L. Burle, Mr. Hensley said the cost per bed would be about £350. The report having been adopted, the seals of the envelopes were broken, and it was announced that the authors of plan A were Messrs. Treadwell and Martin, 2, Waterloo-place, Pall Mall: of plan I, Messrs. Pennington and Sons, Hastings House, Norfolk-street, Strand; and of plan J, Messrs. Newman and Newman, 31, Tooley-street, London Bridge.

TIPTON.—The first prize of £25 in the public competition for the best plan for laying out the New Victoria Park at Tipton has been unanimously awarded to Messrs. William Barron and Son, Elvaston Nurseries, Borrowash. Their plan shows a lake about three acres in extent, cricket and recreation grounds, lawn-tennis grounds, bowling-green, band-stand, shelters, &c. They also furnish plans for lodge, entrance-gates, ornamental fencing, &c. The park is 33 acres in extent. The second prize was awarded to Mr. John Perry, architect, Tipton. There were ten competitors.

The Chancellor of Truro diocese has at length granted a faculty for rebuilding the tower of the parish church of Liskeard, on condition that at least £2,500, including a sum of £1,000 receivable from the Peddar Legacy, has been raised towards the estimated outlay, £3,500.

The aggregate realisation at the Auction Mart last week was £207,000, an excellent result, taking into consideration the fact that the attractions of the Ascot Meeting were not without influence on the market. Last year the amount registered for the corresponding period was £133,806, so that the ground lost in the month of May is being rapidly made up. This week has been one of the busiest of the season, the supply of properties of all descriptions having been much beyond the average.

ARCHÆOLOGICAL.

PETERBOROUGH.—A discovery of great interest has been made at the Peterborough Cathedral restoration works during the past week. For some time excavating work has been in progress for the purpose of underpinning the foundation of the north-east corner walling of the eastern chapel, which has shown marked signs of subsidence. The foundations of this chapel were found to be partly built on the ancient Saxon wall (*circa* 800), which was a considerable surprise, and altogether a valuable archæological find, especially as it had been considered that the building was in the vicinity of the old Saxon ditch, which bounded the original Medehampstead, or ancient Peterborough, and that the foundations having been placed within the area of the ditch accounted for the subsidence. During the past week, however, all doubts both as to the direction of this ancient waterway, and even of its locality, have been set at rest. At the depth of about 12ft. the rock was found to have been cut right, though to the underlying clay in a direction running due east and west. Instead of there being evidences of mud, or any deposit of an alluvial character, the ditch was seen to contain a layer of about 2ft. of peat ashes. The ditch was found to empty itself through a well-defined pass in the Saxon wall. It evidently ran in a line with the present north wall of the cathedral, and here again has been found a reason for the subsidence of the northern wall of the great fabric itself. Data and drawings are being gathered by the architect's clerk of the works, Mr. J. T. Irvine, which will form the subject of a paper to be read during the approaching Archæological Congress in the city. The Saxon tombstones *in situ* in the north transept have, by this discovery of the Saxon ditch, been relegated to the period of the *second* Saxon church at Peterborough, as otherwise they would have been southward of the ditch, whereas they are well on the north side.

The British School on Smithwick Hill, Falmouth, has been acquired by the local school board, and has been altered and greatly enlarged. Mr. A. E. Skinner, Falmouth, was the builder.

It was formally stated at the last meeting of the Museums Committee, that the Queen had expressed her desire to lay the foundation-stone of the new Science and Art Buildings, which are to be erected at South Kensington, at an estimated cost of £80,000. We illustrated Mr. Aston Webb's designs for the buildings, which were selected in competition nearly seven years ago, in our issues of August 7 and 14, September 11, and November 20, 1891.

In our notice last week of the opening of the University College Extension, Reading, by the Prince of Wales, we should have mentioned that the constructional steelwork was executed by Messrs. Mark Fawcett and Co., of 50, Queen Anne's-gate, Westminster, and that the floors are built upon Messrs. Fawcett's patent system.

A new tramway has been opened connecting Fleetwood with Blackpool, on the electric haulage system. The length of the line is ten miles, and it now completes a chain along the Lancashire sea coast of fully 25 miles. It is proposed to extend the tramway along the Ribble Valley to Preston, which will make the line the longest in the kingdom.

The laying out of the Victoria Gardens at Truro, which are to serve as the city's permanent memorial of the Queen's Diamond Jubilee, has been completed under the direction of Messrs. Henderson and Son. The formal opening took place on Monday.

A new church is in course of erection in the parish of St. Mary Magdalen's, Accrington. It is intended to accommodate 530 persons, and will cost £7,800. At present it is proposed to proceed only with the chancel and eastern portion of the nave, and leave the tower, spire, and west extension for a subsequent effort. In 1891 a new school was erected adjoining the church site at a cost of £3,200. It has been decided to lay the foundation-stone of the new church to-morrow (Saturday).

The Victoria Buildings in Silver-street, Bury, Lancs, have just been completed. The block comprises four shops and fourteen sets of offices, and has been erected by Mr. C. Brierley, contractor, the architect being Mr. J. D. Mould, of Bury and Manchester.

A stained-glass window has just been placed in South Wingfield Church, Derby. It has been erected by Messrs. Peter and William Summerton, of Leeds, in memory of their parents, who for many years lived in the village. The window represents our Lord Jesus Christ as the Consoler of Mankind, and has been designed and executed by Messrs. Powell Bros., of Park-square, Leeds.

Building Intelligence.

BENWELL, NEWCASTLE-ON-TYNE. — A new building estate has been opened out at Benwell to the north of the parish church. This estate is being developed by the Tyneside Land and Property Corporation, Limited. The first contract for an entire street, amounting to several thousand pounds, has been let to Mr. J. Hutchinson, of Elswick-road, Newcastle. The work of construction will be supervised by Mr. C. T. Marshall, architect, of Northumberland-street, from whose plans the houses are being erected. In addition to the above, plans are being prepared for blocks of shops and buildings of a public character by Messrs. Dunn, Hansom, and Fenwick, architects, Eldon-square. The directors of the company have given instructions to Mr. C. T. Marshall to prepare the plans of a large building to be erected opposite the church, at the corner of the main turnpike and Charlotte Pit-road. Bricks are about to be made on the site, machinery and plant having been laid down by Mr. Burnett, of Scotswood, for this purpose. The surveyor to the estate is Mr. Welton, of Hexham, who has laid out the whole in streets, the drainage being carried out also under his direction.

EXETER.—The formal opening of the new offices, &c., erected for the Exeter Gas Light and Coke Company on the site of houses formerly known as Nos. 11 and 12, East Southernhay, took place on Tuesday week. The front elevation is composed, in the lower story, of Doulting and red Corsehill stone, with polished granite columns at the entrance. The upper story is of Doulting and red Gloucester stone, the roof being of Broseley tiles. There is considerable grotesque and floral carvings on the front, the work of Mr. E. T. Rogers, of St. Sidwell's-street, Exeter. A vestibule, with oak fittings and ceiling of the same material, opens into a hall some 24ft. in length, and contains a tiled chimneypiece. On the left is the general office, and opening from it is the strong-room. Straight through from the main entrance is a showroom 40ft. by 25ft., and from it a lift is provided for the conveyance of goods to a smaller room on the upper floor. On the ground floor are the outdoor inspector's office, lavatories, and stores. There is a mezzanine floor, containing stores for stationery, &c., and a broad staircase leads to the waiting-room. On this floor are the board-room and secretary's office, separated by sliding doors, and which, when thrown into one room, give an area of 51ft. by 20ft. The showroom on this floor is about 24ft. square, and there are also three rooms for use in connection with the tests of and experiments on the company's products. The building is provided with wrought-iron gasfittings, with incandescent lights. The floors of the hall and general office are tiled, the remainder of the ground floor being laid with wood-block flooring, and dadoes are fitted round all the rooms. Behind the main building are two cottages for the overseers, large workshops, and stores, approached by a wide cart entrance; they are of a substantial character, and, with the rest of the building, were erected by Messrs. Ham and Passmore, from designs by Mr. Dobell.

IPSWICH.—The memorial-stones of a Wesleyan People's Mission Hall were laid in Stoke-street, Ipswich, on Wednesday in last week. Some time ago a syndicate was formed for the purpose of improving Stoke-street at the southern end of the bridge leading across the river into Ipswich, and old cottages were pulled down and the road made wider. The land that was left is that now possessed by the Wesleyans. The buildings in immediate contemplation are a central hall to accommodate 800 persons, a second and smaller hall to hold 250, with class and retiring rooms. The small hall forms with the larger an L-shaped pile, and later on a wing is to be added on the other side. When thus complete, the total frontage to Stoke-street will be about 170ft. At the rear also it is proposed, when funds are available, to build schoolrooms. The larger of the two halls now to be built will measure 56ft. by 46ft., and steps will lead from the porch to a gallery over the hall, a balcony over the street, and a classroom 21ft. by 13ft. At the other end will be a platform 11ft. 6in. by 21ft., at the back of which are two retiring-rooms and a classroom. The small hall will be 22ft. 6in. by 38ft., and will also have retiring and classrooms at the back. The whole will be of red brick and tiled. The halls are to be plastered, with dados, and floored with wood. Messrs. Eade and Johns, of Ipswich, are the architects, and the builder is Mr. Edgar Catchpole of the same town.

UNIVERSITY COLLEGE HOSPITAL.—The Prince and Princess of Wales visited this institution on Tuesday, to lay the foundation-stone of the new edifice, Sir J. Blundell Maple having undertaken to rebuild the hospital at a cost of £100,000. The building is already rising on the quadrilateral area bounded by Gower-street, Grafton-street, Huntley-street, and University-street. The material is red brick, with terracotta dressings, and the plan is that of a diagonal cross. A special feature, for which Dr. Poore is responsible, is the isolation of each ward. The arms of the cross will be separated from the central block, with which communication is to be established by means of bridges. Corridors and staircases are thereby abolished from the interior of the hospital. The plans have been prepared by Mr. Alfred Waterhouse, R.A., and are designed to give accommodation to 300 patients. We illustrated the new hospital in the BUILDING NEWS for May 8, 1896.

SLEDMERE.—The church of St. Mary at Sledmere, on the Yorkshire Wolds, was consecrated on Friday by the Archbishop of York, having been rebuilt at the sole expense of Sir Tatton Sykes. The church is entirely new, excepting the 14th-century tower, which was the only part of the Mediæval building left when, about the middle of the last century, it gave way to a plain structure. The lines of the original church having been discovered during the removal of the Georgian building, it was determined to erect the new church on the same ground plan as the Mediæval one. It now consists of a nave of five bays, with north and south aisles and a chancel. The vestries are on the north side of the chancel, with the organ-chamber over the choir vestry. The style adopted is 14th-century English-Gothic. The lofty nave arcade has richly moulded columns and arches, with moulded caps and bosses. The aisles are vaulted in stone, the cells of the groins being filled with clunch, and the ribs and bosses being in red stone throughout the interior. Nave and chancel roofs are carried from west to east at one unbroken level, and are constructed of oak, while the ceilings are panelled in oak with carved bosses at the intersections of the main timbers and ribs. In the windows, tracery of the earlier type of the Flowing Decorated has been used, the great east window being in five lights. The chancel windows are entirely filled with stained glass. At present the nave windows are only temporarily glazed; but it is Sir Tatton Sykes's intention to fill these with stained glass similar to that in the chancel. A feature of the church is the stone reredos at the east end of the north aisle, rising nearly to the height of the vault; while immediately above the high altar is a reredos carved in wood representing the Crucifixion, with the Virgin and St. John and the Apostles on either side. The floors of the church are of Irish marble. The tower has been restored, and a parapet added to the original design. On the parapet are shields bearing the arms of families that have at different times been connected with the estate. The whole of the exterior of the church is executed in Whitby stone. Mr. T. Moore, of London, was the architect, and the whole of the work has been carried out under his supervision. The contractors for the work were Messrs. Thompson, of Peterborough, whose representatives have been Mr. Geo. Mills and Mr. J. Baker. The marble flooring is from the works of Mr. R. Collis, Kilkenny.

SOUTHWARK.—A special service was held on Wednesday in the Collegiate Church of St. Saviour, Southwark, on the occasion of the unveiling of the stained-glass window in memory of the late Prince Consort, the starting of the new clock and chimes, and the unveiling of the memorial windows to Edward Alleyn and Elizabeth Newcomen by the Duke of Connaught, and the dedication of the pulpit and lectern by the Bishop of Rochester. The three windows were all designed by Mr. C. E. Kempe. That in memory of the late Prince Consort—the gift of Mr. Frederick L. Bevan—is in the north transept, and comprises four subjects—Gregory the Great, Ethelbert, Stephen Langton Cardinal Archbishop of Canterbury), and William of Wykeham, Bishop of Winchester ("architect, statesman, and father of the public school system of this country. He was ordained acolyte, sub-deacon, and priest, 1362, in the Chapel of Winchester House, which adjoined the west end of this church.") The memorial window to Edward Alleyn, which is in the south aisle, was given by the governors and old scholars of Dulwich College, which he founded in 1619. Alleyn was also one of the Corporation of Wardens of St. Saviour's in 1610. The lowest panel of the window is a figure of Charity, and in the middle panel Alleyn is seen reading in the college chapel the charter and constitution of his foundation in the presence of Lord Chancellor Bacon, Lord Arundel, Inigo Jones, and others. His portrait occupies the head of the window. The Elizabeth Newcomen memorial window is in the south transept. In allusion to her name, St. Elizabeth occupies the base of the central light as the leading figure, above which is St. John the Baptist, supported by Elijah and Malachi. Elizabeth Newcomen was "a generous, educational, and charitable benefactress of the parish." She was buried in the church on November 20, 1675. The new clock, which is the gift of Sir Frederick Wigan, has been designed and manufactured under the direction of Mr. H. Hardwicke Langston, A.R.I.B.A., at the works of Messrs. Gillett and Johnston, of Croydon. It is constructed to show the time on four faces, each 9ft. 6in. in diameter, and the quarters are chimed on bells Nos. 6, 7, 8, and 11, the hours being struck upon the 12th, or tenor bell, which weighs 52cwt., by a hammer weighing 96lb. The pulpit is of carved oak, and the lectern is of bronze and over 6ft. high: both are special gifts.

SPRINGBURN, GLASGOW. — Wellfield U.P. Church, Springburn, the foundation-stone of which was laid on Saturday, is at the corner of Balgray-hill and Murdoch-street, and extends back to Sutherland-street. As there is a difference of over 27ft. between the levels of the back street and Balgray-hill, the hall has been placed facing Sutherland-street on the higher level, and entering from Murdoch-street, the rooms, vestry, session-house, &c., on an intermediate level, while the church occupies the corner of Murdoch-street and Balgray-hill, with entrance from both streets. Internally the church is planned with nave and side aisles, separated by moulded stone arches carried on splayed stone piers. There are galleries at sides and end, but the galleries are kept back behind the line of the stone piers, allowing these to be carried up in an unbroken line. Above the piers attached stone shafts are carried up, terminating in carved caps, from which spring the principal roof couples. The pulpit will be placed under a wide stone arch at the eastern end, and on each side, under smaller arches, an organ-chamber is arranged. The hall is 54ft. long and 28ft. broad, and there are two large classrooms, which can be opened into one, forming a lesser hall for 100 persons. The style is Late Decorated, and the principal feature externally will be the tower and spire, which will be over 100ft. high. The lower stage is carried up square to the belfry chamber, where the plan becomes octagonal, with projected buttresses at angles. The mason-work is in red sandstone. The number of sittings provided is 808, and the cost will be about £7,200. The architect is Mr. John B. Wilson, Glasgow, and the contractors are:—Mason, H. Nelson and Co.; wright, Thomas Brown; slater, Thomas Muir; plasterers, J. and A. Williamson; plumber and gasfitter, Thomas Munro; glazier, Joseph Miller; and painter, A. Stirling—all of Glasgow.

SUNDERLAND.—Close to Roker Park is the scene of large alterations in the shape of a new football field for the Sunderland Association Football Club. The entrances are formed on all sides, making a total of fourteen entrances and seven exits, also a private entrance to Press-box, built in the centre of the west stand. The pitch is 111 yards by 71 yards, turfed, levelled, and drained with touch space 7ft. outside. Beyond this, again, is the players' running and training track 12ft wide, levelled and rounded at the corners: this is inclosed by a wrought-iron barrier. The stands are arranged in the raking fashion, allowing all spectators to see over the ground, a special feature having been made at the corners. The stands accommodate 26,000 people, and the slope in front will stand comfortably 8,000 people, making a grand total of 34,000 people. The grand-stand is 71 yards long, situated on the east side, and will seat over 2,000 people. This stand is heightened in front to 7ft. on concrete and brickwalling, so that the spectators' heads of those standing on the slopes will not interfere

with those seated behind. The entrance to this is by a stair to a 4ft. wide balcony in front. There are special filling staircases to backs of all stands. The work has been planned by, and is now being carried out under the supervision of Messrs. Wm. and T. R. Milburn, architects, 20, Fawcett-street, Sunderland, the general contractor being Mr. J. W. White, Chester-road, Sunderland.—There are now in course of erection large brewery extensions at the Monkwearmouth Brewery, belonging to Messrs. James Deuchar, Limited. The new building is situated near Sunderland Bridge. It is five stories in height, composed of two large cellar floors, one barley floor, two malting floors, and kiln floors. The building, which is 170ft. long by an average of 60ft. wide, covers an area of 912 square yards, is built of brick, plain, but substantial. The premises have been planned, and are now being carried out under the supervision by Messrs. Wm. and T. R. Milburn, architects, Sunderland, the contractor being Mr. T. P. Shaftoe, also of Sunderland.

CHIPS.

The parish church of South Wingfield, Derby, has just been further beautified by the addition of a stained-glass window. The work has been designed and executed by Messrs. Powell Bros., of Park-square, Leeds.

The Nuneaton Urban District Council at their last meeting received seven tenders for the laying of mains along Plough Hill. The figures named were £286, £379, £508, £526, £550, £810, and £818. The margin between the highest and lowest caused much amusement. The matter was referred to the waterworks committee.

The foundation-stone of the Central Technical Schools for Liverpool will be laid on Friday next, July 1st. The schools occupy a commanding position bounded by William Brown-street, Byrom-street, and Clayton-street, and the building work is now being carried on with the utmost expedition. All the foundations of the structure are down, and the walls have reached the street level. The plans of Mr. E. W. Mountford, F.R.I.B.A., of London, were adopted by the committee, having been selected in competition; the contractors are Messrs. Henshaw and Son, Chatham-street; and the clerk of the works is Mr. James Scales. The cost will exceed £90,000.

The Rev. F. W. Mortimer, Vicar of Darlington and Rural Dean, has consecrated a new carved oak reredos, in the parish church at Middleton-in-Teesdale, as a memorial of the late rector, the Rev. John Milner, M.A., who was rector for twenty-two years. The subject is "The Good Shepherd," and it is the work of Messrs. Harry Hems and Sons, of Exeter.

At Liverpool, on Tuesday, Mr. T. H. Ismay, head of the White Star Line of steamers, laid the foundation-stone of a building which is being erected by the People's Houses Company, Limited, on the model of the Rowton Houses in London. The building is situated at Bevington Bush, where many seafaring people reside. The new building will provide for 650 at a uniform charge of sixpence per night, with full access to all conveniences of the place.

The recent additions to the collection in the Corporation Art Gallery of Birmingham—the picture of "Scarborough," by Mr. Henry Moore, R.A., given by Mr. James R. Holliday, and the "Piazza of St. Mark's, Venice," given by Sir John C. Holder, Bart.—are now hung in the gallery, as is also the portrait of the late Mr. Edmund Tonks, by Mr. Frank Holl, R.A. With them is another notable work, the "Val d'Aosta," by Mr. Brett, A.R.A., lent by Mr. Severn; a drawing which, when it was exhibited in the Royal Academy forty years ago elicited from Mr. Ruskin unreserved commendation.

The Board of Trade have issued an order granted by the Light Railway Commissioners, and now confirmed by them, authorising the Great Western Railway Company to construct the Wrington Vale Light Railway, which was originally promoted by an independent company. The railway authorised by this order comprises a line nearly 6¼ miles in length, commencing at the Congresbury Station on the Cheddar Valley branch of the Great Western system, and passing thence through Churchill, Wrington, and Burrington, to its termination at Blagdon, with branches to the Bristol Water Works Company, and to a point known as Langford Lane. The time granted for the construction of this railway is three years from the 18th of last March.

The Bdlericay Rural District Council have resolved to apply to the Local Government Board for sanction to borrow £5,000 for a joint sewerage scheme for the parishes of Shenfield and Hutton. The scheme has been designed by Messrs. Bailey Denton, Son, and Lawford, of Westminster, and will be carried out immediately.

Engineering Notes.

SHREWSBURY.—Alterations which have been in contemplation for over thirty years have been commenced at Shrewsbury Station, and will involve an expenditure by the joint railway companies of something like £300,000. The Great Western Railway from Shrewsbury to Chester was opened in 1848, and the station was built on the assumption that the traffic would amount to about forty trains per day. At present there are over two hundred passenger trains alone to be dealt with, and the goods trains number from two hundred and fifty to three hundred. At the Birmingham end of the station the viaduct which crosses the Severn is to be widened to three times what it is at present, for what is practically a new bridge will be erected on either side of the present structure. In the centre of the river will be a pier of cylinders, from which will run a one-span arch to each bank, of 100ft. between the piers. For this work the Cleveland Iron Co. have entered into a contract for about £160,000, which includes other extensions at the same end of the station. At the other end, where the Chester and Crewe lines branch off, there will also be extensive improvements. The bridge, which at present crosses Castle Foregate, is 80ft. wide, and its width will be increased to 217ft.; but there will be an open space affording light for street traffic. A number of shops and private houses are to be demolished. Cross-street will be covered by another widened bridge, and Howard-street will be "moved" lower down the Foregate, and the gradients improved.

New premises for the local branch of the Devon and Cornwall Bank are about to be erected at Honiton on the site of the present East Devon Stores, opposite the Dolphin Hotel, from plans by Messrs. Ralling and Lonar, of Exeter.

At the Council House, Bristol, on Friday, Mr. W. O. Meade-King, C.E., one of the inspectors of the Local Government Board, held an inquiry with reference to an application by the sanitary authority to borrow £10,000 for purposes of wood-paving, £2,500 for the new sanitary depot in Albert-road, and £226 for sewage works in Redcross-street.

The National Trust for Places of Historic Interest or Natural Beauty is in the field for the purchase of Tintern Abbey. It is suggested that a number of local gentlemen should purchase the Abbey and Monmouth and Raglan Castles, pending the promotion of a Bill in Parliament enabling the Monmouth County Council to acquire these historic buildings.

The Chester-le-Street Rural District Council have instructed Messrs. D. Balfour and Son, of London and Newcastle, to report on a scheme of main sewerage for Chew Dene, Wrekenton, Eighton Banks, and Team Colliery, in the township of Lamesley, to be connected with the western sewer of the corporation of Gateshead.

The scheme of water supply submitted by the Easington Rural District Council for Wingate Mill, Wingate-lane, and High Wheatley Hill has been officially approved by the Local Government Board. It is proposed to obtain the water from the Kelloe Winning pumping-station of Messrs. W. Scott and Co., Ltd., where it is obtained from the sand-feeder underlying the limestone, and will be pumped into a tank by a forcing set of pumps attached to the main pumping-engine. The analysis certifies the water to be of excellent quality. After reaching the first tank, the water will again be pumped into an elevated storage tank to be erected on the highest point in the district at Wingate Mill, with capacity equal to several days' supply, from whence it will be distributed in cast-iron mains over the district. The engineers are Messrs. D. Balfour and Son, of London and Newcastle.

The Gates Memorial Fountain in the Market-place at Peterborough was inaugurated on Tuesday week. It takes somewhat the character of the old Eleanor Crosses. It is a slender Gothic structure, over 30ft. in height, octagonal in plan, and in three stages. The lower stage carries the basins, and the taps are under a traced canopy on four sides. The next stage is panelled, having buttresses at the angles, carried on carved corbels, and the heads are filled in with tracery. Mr. James Ruddle, of Peterborough, is the architect, and Messrs. Roberts, of Stamford, carried out the work.

The Improvements Committee of the London County Council, having considered a scheme for the embankment of the Thames from the Victoria Tower Garden, Westminster, to Lambeth Bridge, and the widening of Millbank-street, have issued a report on the progress made, but do not at present recommend the adoption of any particular scheme.

PROFESSIONAL AND TRADE SOCIETIES.

THE ARCHÆOLOGICAL AND ARCHITECTURAL SOCIETY OF DURHAM AND NORTHUMBERLAND.—The second meeting for the year 1898 is being held yesterday (Thursday) and to-day at Levens Hall, Cartmel Priory, and Furness Abbey. Members drove yesterday, on arrival at Heversham Station, to Heversham Church, and afterwards proceeded to Levens Hall, the seat of Captain Bagot, M.P. The party then proceeded to Cartmel, where the fine church of St. Mary's Priory was examined, and they stayed overnight at Grange-over-Sands. This (Friday) morning members will take train to Furness Abbey, founded in 1127, where the remains of the abbey will be described by Mr. C. C. Hodges, F.S.A.

SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS.—The annual meeting of this society was held on Thursday afternoon in last week, in the meeting-room of the Society of Antiquaries, Burlington House, under the presidency of the Bishop of Bristol. Lord Balcarres moved the adoption of the report, and, in doing so, said he thought the society had done a great deal during the last year. It would be almost a truism for him to point out that many interesting and valuable buildings of bygone times had been restored—or, in other words, destroyed—without the efforts of the society being able to effect any protection whatever; but they must not relax their vigilance and energy for a moment. If they could persuade more persons to act as local correspondents of the society, it would certainly save the society much trouble, and in every way expedite its proceedings. Mr. Lovibond seconded the motion, which was agreed to. Mr. H. E. Luxmoore read a paper on "Our Purposes and Prospects." The Bishop of Bristol, in moving a vote of thanks to the lecturer, said that they had to face the fact that in England we were terribly crowded. In former times there was more room for building; now, time after time, it was brought to his notice that a larger number of persons had to be got on to a given area than before, and that could only be done by increasing the number of stories in a building. The higher they went on a certain frontage the worse and worse the effect usually was. He must say, however, that when they went into the City of London on a fine Sunday afternoon, when they could really stand and look at things, they found out that beautiful buildings, very striking buildings indeed—buildings that would be no discredit to Venice or to Florence—had been put up in the City of London in quite recent times, and many of the architects of those buildings did not get the credit for their work. That was an answer to a good many of the criticisms with regard to the removal of old buildings. At the same time, he expressed the fullest sympathy with the objects and principles of the society.

The work of rebuilding the barracks at Winchester is to be proceeded with at once, and the first contract is placed in the hands of a Putney firm. The undertaking is that the foundations should be completed within the next six months.

At a special meeting of the Aston School Board, the tender of Mr. John Bowen, of Balsall Heath, amounting to £19,486, has been accepted for the erection of the new higher-grade school, pupil teachers' centre, deaf school, and caretaker's house, on the site in the Whitehead-road. The architects are Messrs. Crouch and Butler. With the purchase of the site and other charges, the total cost will be about £23,000.

At the last meeting of the town council of Stockport a statement was presented showing the cost of the main intercepting sewer and sewage outfall works up to date as £139,764. It was explained that this was £44,760 in excess of the original estimate, or 47 per cent., and the scheme was not more than two-thirds finished. It is expected to cost £200,000.

The Colwyn Bay Pier Bill, to confirm a provisional order made by the Board of Trade, was certified for second reading on Monday by the examiners of the House of Lords for proof of compliance with the standing orders. The object of the order is to authorise the Victoria Pier and Pavilion Company to construct and maintain a pier at Colwyn Bay, opposite the London and North-Western Railway subway, and extending seaward in a north-easterly direction for 1,000 yards. The company are also authorised to construct on the pier a tramway, pavilions or assembly rooms, concert-rooms, aquaria, shops, saloons, bazaars, kiosks, reading, refreshment, and other rooms, swimming and other baths, &c.

ARMY AND NAVY MANSIONS, VICTORIA-STREET, S.W.—TOMB AT BURTON LAZARS, LEICESTERSHIRE.—MURAL MONUMENT, NEWBOLD.—STUDIES OF ANIMAL LIFE.—HOUSE AT MEDMENHAM.—COTTAGES AT WALTHAM ABBEY.—FOUNTAIN AT MARKET DRAYTON.

Our Illustrations.

ARMY AND NAVY MANSIONS.

THIS building comprises two blocks of residential flats of seven stories, situate at the corner of Victoria-street and Francis-street, Westminster, S.W. It is erected in red brick with Portland stone dressings, and is fireproof construction throughout. The buildings were erected and carried out by Mr. W. Goodwin, builder, of Hatton Garden, at a cost of £40,000, from the designs and under the superintendence of the architect, Mr. Chas. J. C. Pawley, of Victoria-street. The red facing-bricks were supplied by Messrs. Lawrence and Sons, and the lifts by Messrs. Waygood and Messrs. Medway.

TOMB, BURTON LAZARS.

THE yard of the small, but rich, church of Burton Lazars is dotted over with many fine tombstones of the late 17th and the early 18th century, although none, perhaps, equal in importance the subject of the sketch, which is designed in the style of the Renaissance. The details of the carving are very charming—unusually so, for the date—the two globes in particular, representing the Six Days of Creation, being excellent. The figures at either end are unfortunately somewhat mutilated.

MURAL MONUMENT, NEWBOLD.

THIS monument of carved and coloured marble is built into the wall of the south aisle of Newbold-on-Avon Church. It is in the style of the Late English Renaissance. The top portion commemorates Edward Boughton and his wife, the latter a member of the famous Catesby family. The lower portion is to the memory of William (the son of above-mentioned Edward Boughton) and his wife. In each case the children of the respective parents are represented, the boys being placed on one side and the girls upon the opposite, this being quite the usual custom in monuments of the period. The children are also usually named upon the inscription (as in this case) or upon separate scrolls under each child. The top portion is decidedly superior in design and execution to the lower, especially in the decoration of the pilasters on either side. The method of treatment also differs considerably: in the upper the background is cut back and coloured, leaving the ornament light upon dark; whilst the lower pilasters have inlaid strips of grey marble projecting beyond face of pilasters—a remark also applying to the heart at the bottom of the structure. It is also interesting to note the ruffles around the lady's neck in the upper as compared with the more severe style of the lower portion. Evidently, then, on account of the difference of ornament, the lower part was added subsequently to the upper, the two forming one complete monument.

STUDIES OF ANIMAL LIFE, TREATED FOR DESIGN.

THIS sheet of National Silver Medal drawings, by Mr. H. Brownsword, presents in an eminently interesting way several very decorative sketches of picturesque birds' heads, familiar enough, of course, as natural history specimens, but so represented as to indicate suggestive treatments for all kinds of applied design. The smaller studies illustrate the birds full-length in each case, and show characteristic attitudes of the examples chosen for representation more in detail by the larger drawings. The habits of the birds themselves, and the uses to which their peculiarities are adapted in nature, are in this way very usefully indicated for reference.

HOUSE AT MEDMENHAM.

THE drawing illustrated was the first design for a house now being built for Mr. Hudson Kearley on the high ground overlooking the river between Great Marlow and Medmenham. The materials are red brick with Clipsham stone dressings, and Whitland Abbey slates. On the south side is a loggia with columns and a gallery above. Mr. Reginald Blomfield, of New Court, Temple, is the architect, and Messrs. Holloway Brothers are the contractors for the work. The drawing is exhibited at the Royal Academy.

COTTAGES ON THE COLVIN ESTATE AT WALTHAM ABBEY.

THE drawing shows some of the cottages erected for Mr. R. B. Colvin on his estate at Waltham Abbey, to supply the long felt want for convenient and modern homes for the artisans in the neighbourhood. The group of four cottages in the foreground is pleasantly situated alongside the main road, from which they are well set back, thus allowing scope for a front flower garden. They are built with red brick facings to ground-floor, the upper story being faced with rough-cast, and the gables constructed of half-timber work, and the roofs are covered with plain tiling. In the background is shown one pair of semi-detached cottages. These pairs of cottages have less accommodation than the group of four, and are suitable for small families, and are plainly built with red brick facings on ground-floor and rough-cast upper story, with a plain hipped roof covered with pantiles. All the bricks and tiles were made on the estate. The architect is Mr. F. W. Adams, of Finsbury Circus-buildings, 18, Eldon-street, E.C., who is architect to the estate.

CHIPS.

Sanction has been given by the Local Government Board to the urban district council of Broadstairs and St. Peter's for a loan of £17,800 for sewerage.

The London County Council passed, on Tuesday, a resolution to serve a notice on the London Tramways Company to acquire 18¼ miles of their system. This comprises the lines running from Westminster and Blackfriars Bridges to Greenwich and Brixton.

At Cattedown, Plymouth, the western section of a new church has been built from plans by Messrs. Weblin and De Boinville, of Plymouth. The present portion of the building is seated for 200 people.

A large clock, with quarter chimes, has just been erected in the parish church of Uppingham, Rutland, by Messrs. John Smith and Sons, Midland Clock Works, Derby.

The foundation-stone of the cottage homes now being erected for the Aston Board of Guardians from plans by Messrs. Franklin, Cross, and Nichol, of Birmingham, will be formally laid on the 20th July.

The directors of the Metropolitan Railway Company have decided to construct the proposed new station between King's Cross and Farringdon-street. It will be placed at the junction of Rosebery-avenue and Farringdon-road, and will be a great convenience for those who wish to reach Clerkenwell from the City or West End. Under the Bill now before the House of Lords, and which has already passed all stages in the House of Commons, the directors propose to expend some £80,000 in temporary measures of ventilation pending the ultimate adoption of electrical traction in lieu of steam.

At a general assembly of the Royal Society of British Artists, held last week, the following were elected, viz.:—Messrs. Cecil Burns, Martin Bruce, Ralph Headley, and Leon V. Solon.

The Exhibition of French Art at the City Guild-hall continues to draw unprecedented numbers, over 50,000 having visited it during the past fortnight. This number shows an average of 420 per hour on week-days, and 630 per hour on Sundays.

THE SANITARY INSTITUTE.

AT an examination for sanitary inspectors held under the auspices of the Sanitary Institute of Great Britain, in Leeds on June 10 and 11, 1898, 36 candidates presented themselves. The following 20 candidates were certified, as regards their sanitary knowledge, competent to discharge the duties of inspectors of nuisances:—Edwin Ainley, Huddersfield; John Robert Bell, Snape; Tom Biker, Bardoldswick; George Henry Canby, Keighley; Edwin Carratt, Leeds; James Coupe, Bramley, Leeds; James Samuel Cromack, Leeds; Arthur George Dalzell, Halifax; John Finn, Penrith; Frederick William Girven, Easington-lane; Joseph Jackson, Penrith; William Thomas Jolfs, Birmingham; Henry King, Millom; John William King, Blackburn; Augustus Henry Merryman, Castleford; Miss Lizzie Marguerite O'Kell, Bedford; Robert Claybourn Schofield, Keighley; George Scott, jun., Daisy Hill, *nr.* Chester-le-Street; George Siddall, Ossett Spa; and Alfred Wharfe, Keighley.

AN ARCHITECT TRIED FOR MANSLAUGHTER.

PROSECUTION ABANDONED.

AT the Central Criminal Court yesterday (Thursday), before Mr. Justice Grantham, Charles James Chirley Pawley, architect and surveyor, of 2, Prince's Mansions, Victoria-street, S.W., was indicted for the manslaughter of William Clifford Morse, labourer, and six other builders' workmen in the employ of W. R. Rickard, who lost their lives by the collapse of the roof of Abbey Mansions, Orchard-street, Westminster, during the course of erection on April 21st. Mr. C. F. Gill, instructed by the Treasury, appeared for the prosecution, and prisoner was defended by Mr. Horace Avory and Mr. Hugo Marshall, instructed by Messrs. Marshall and Marshall. On the case being called, Mr. Gill said the Treasury did not see their way, on a revision of the evidence, to proceed with the case. Mr. Justice Grantham expressed his concurrence in the decision arrived at, and the prisoner was accordingly acquitted, the jury returning a verdict of "Not Guilty."

The terminus of the Highland Railway at Kyle of Lochalsh has been lighted by acetylene gas, plant for the manufacture of which has been laid down by the British Acetylene Gas Generator Company (Limited), Kirkcaldy.

A new post-office in St. George's-place, Lord-street, Southport, was opened on Monday. The front is built of Storeton (Cheshire) stone, Aberdeen granite, and Accrington pressed bricks. The public office is a large room, with a counter running along three sides, but pierced in the centre so as to get to the public telephone room. A letter-box on the counter is a new feature. The sorting will be done in a large room in the rear, with a basement. Four rooms to the front over the public office are allotted to the surveyor, his assistants, clerks, and stores; and on the other side of the corridor are rooms for the postmaster and the chief clerk. The instrument rooms are on the second floor, and the caretaker's rooms on the third. Messrs. Wishart and Irving, Southport, are the chief contractors.

The Court of Common Council have under consideration a report from the City Lands Committee asking for authority to expend £2,500 in carrying out works at the entrance to Guildhall from Basinghall-street—viz., a new entrance gateway, asphalte paths and carriage-way, the forming of a dry area at the north end of the library; finishing the bay of the council-chamber by building a new window and buttresses, a new building on the site now occupied by the Chamberlain's old parlour, to contain offices; and a corridor connecting the library to the council chamber.

A special meeting of the Stockport Board of Guardians was held last week, to answer the inquiry of the Local Government Board as to the intentions of the guardians with reference to carrying out the plans for erecting a new workhouse sanctioned as long ago as January, 1897, this following upon a report by Mr. Dansey, poor-law inspector, that the present workhouse at Shaw Heath was overcrowded. It was stated that the tenders for the work were about £130,000, and that there was the land available for this extension, while the overcrowding was testified to by the master of the workhouse, who said the house was certified for 650, and he had accommodated over 900. After a lengthy discussion, it was decided to ascertain the cost of the workhouses at Gateshead, South Shields, Barton-on-Irwell, and Doncaster, and to seek an interview with the Local Government Board's architect and inspector.

FOUNTAIN AT MARKET DRAYTON.—MR. G. A. CRAIG, *Architect.*

FOUNTAIN, MARKET DRAYTON.

THIS fountain has been erected by Messrs. Hawthorn, Bamfield Kettle, and R. Wycherley (the promoter and secretary, the chairman, and the vice-chairman, of the Market Drayton Water Company) to commemorate the 60th year of the reign of Queen Victoria. The drinking basins and the horse and dog-troughs are of red granite. The main parts of the structure, and the large basin, with the exception of the moulding at level of drinking basins, and the three-quarter detached shafts clustered round the octagonal pier supporting the basin, are of yellowish Grinshill stone. The other parts are of red stone from the Annan quarries, Dumfries. Let into three sides of the base of the octagonal pier are carved marble panels, that in front being a reproduction of the Jubilee medal, and the subjects of the others, "Rebecca at the Well" and "Moses Striking the Rock." An inscription panel is at the back. The fountain was unveiled on Easter Monday, April 13, by Mr. H. R. Corbet, M.F.H., the lord of the manor. The work has been carried out by Mr. Henry Harding, architectural carver (of Nantwich, Cheshire), who is personally responsible for the whole of the carving. The lamp, of wrought iron and copper, is by Messrs. Brawn and Co., of Birmingham. The design is by Mr. George A. Craig, architect, of Market Drayton.

The directors of the Smelting Corporation, Limited, whose present headquarters and works are at Swansea, have decided to concentrate all the works of the company at Ellesmere Port, on the banks of the Manchester Ship Canal. The outlay will exceed £100,000, and not fewer than 700 hands will be employed at the works.

The new laboratories at University College, Liverpool, which have been erected and equipped by the Rev. S. A. Thompson Yates, for study and research in physiology and pathology, at a cost of over £25,000, will be formally opened on Oct. 8. Lord Lister, president of the Royal Society, will perform the opening ceremony.

Two of the pontoons intended for the passenger landing-stage on the Barry Island Railway extension have been delivered at Barry Dock from the works of Messrs. Lysaght and Sons, Bristol. These pontoons are 90ft. in length, and 24ft. beam, and 10ft. in depth. Another pontoon of like dimensions, intended for the same landing-stage, has been launched at the builder's yard, and the small pontoon is also on the blocks at Messrs. Lysaght's works. The sliding caisson at the entrance to the No. 2 dock at Barry will be completed by the builders, Messrs. Stephenson and Co., in the course of three or four weeks, but the new dock will not be ready for opening for at least another three months.

CHIPS.

The sanction of the Local Government Board has been obtained to the borrowing, by the Burnley Corporation, of £19,000 for works of sewerage and sewage disposal; £8,000 will be expended on sewage treatment and the rest on main sewerage.

In commemoration of the jubilee of the dedication of Holy Trinity Church, Hartshill, near Nuneaton, a new pulpit in pitch-pine, the work of Messrs. Pratt and Sons, of Covent Garden, W.C., has been erected, and the internal walls of the apsidal chancel have been decorated in colour and gold.

The vestry of Lee, S.E., have decided to purchase the ten acres of land surrounding the Manor House, together with an additional three-quarters of an acre from Lord Northbrook, for £9,600, as a recreation ground. Lord Northbrook has offered to contribute £1,300 towards the purchase, leaving £8,300 to be provided by the public authorities. The London County Council will, it is expected, contribute half of this amount.

The parish church new day-schools at Radcliffe, Lancs, will be opened by Archdeacon Wilson, of Rochdale, on July 5. The new schools, the foundation-stones of which were laid by Colonel Le Gendre Starkie last August, have been designed to accommodate 400 children. There are playgrounds at the back and front of the schools. The cost of the premises is £3,200. The architect is Mr. T. Bell, of Burnley.

A theatre and opera-house is about to be erected at Taunton. The drawings and plans for the building are being prepared by Messrs. Drake and Pizey, architects, Baldwin-street, Bristol.

Messrs. Gates and Thomas, contractors, Dawen, have commenced excavations in connection with the curved bridge which they have contracted to construct over the L. and N.W. Railway, near the level crossing at Sandycroft, Cheshire. The work will be supervised by Mr. Ross, agent to Messrs. Gates and Thomas, and Mr. C. Graves officiates as foreman. The work will be about 12 months in construction.

The town council and Burns club of Leith have agreed that the statue to Robert Burns shall be erected at the junction of Bernard and Constitution-streets, in that town.

The bridge carrying the South-Eastern Railway over Alaska-street (the first bridge past Waterloo Junction signal-box towards Charing Cross) is now being reconstructed, and all trains have to slow down to five miles an hour when passing over the bridge.

The Helensburgh Police Commissioners have offered to purchase the local gas undertaking at a total sum as finally adjusted of £31,116. The offer is subject to the consent of the shareholders being got and the Gas Supply (Scotland) Act adopted. Failing the commissioners' acceptance of these terms, the whole question of purchase to be submitted to arbitration.

The American School of Classical Studies at Rome will be for the next year under the charge of Professor Peck, of Yale, Professor Norton taking the chair of archæology, and Professor Merrill that of Latin literature.

The South Hornsey Urban District Council have taken a poll of the ratepayers on the adoption of the Public Libraries Act; 2,430 papers were sent out. Only 970 papers were returned, 579 being for and 391 against the adoption.

A drinking fountain is about to be erected on Richmond Hill, as a memorial to the Duchess of Teck.

The Rev. T. H. Le Boeuf, the rector of Croyland, states that Messrs. John Thompson and Son, of Peterborough, recommenced work on the 1st inst. at the north wall of Croyland Abbey. He appeals for help towards raising the £1,380, which the work of underpinning the whole north aisle and the rebuilding the bay next the tower will cost.

The population of Carnforth has increased to over 3,000, owing to the fact that in recent years Carnforth has become an important railway centre and possesses large ironworks. The parish church, with only accommodation for 300, has become too small for the congregation, and plans have been prepared to extend the west end and provide additional accommodation, at a cost of £3,000. It has also been decided to build a new parsonage, at a cost of £1,200.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

QUESTIONS.

[11975.]—**Malleable Cast Iron.**—Wrought iron is much quicker corroded by rust than is ordinary cast iron. Will some reader kindly give me the benefit of his experience as to malleable cast iron? Is it, as to rusting, comparable with wrought iron or ordinary (non-malleable) cast iroo, or does it hold an intermediate place.—A. H.

REPLIES.

[11967.]—**Testing Cement.**—The best cement made is Portland cement, and there are several ways of testing it. It should be freshly ground, "cool," or it is liable to "blow" during setting. The weight is sometimes considered to be one test, a heavy cement being generally slow in setting compared to a light cement, though the weight may be due to adulteration, which, however, is now limited by an association of Portland cement manufacturers. There are special machines for testing the tensile strength, which should average about 350lb. per square inch after being set seven days under water. A thin pat carefully mixed with a minimum quantity of water, and placed on a piece of glass to set, should show no signs of cracking at the edges. A quantity of cement mixed and put in a glass bottle should not crack the bottle, for, if it does, it shows that the cement will swell excessively in setting, which property, however, is sometimes desirable in underpinning. This is a sketch of some methods of testing, which should be carried out by someone with a good experience before the value of the cement can be fully determined.—LOUIS ERWOLD.

[11968.]—**Soundproof Walls.**—The most effectual course for "M" to adopt will be to line the party-walls with some soft deadening material, such as silicate cotton. The simplest form of applying this to walls is in slabs of fibrous plaster padded on the inner side with the "wool," as per F. Jones and Co.'s patent.—GEO. BIRCHMORE, 119, Prince of Wales-road, Haverstock Hill, N.W.

[11968.]—**Sound-Proof Walls.**—The walls can be made sound-proof to a great extent by nailing battens on the walls and lathing and plastering on them.—LOUIS ERWOLD.

[11969.]—**Insurance.**—The difficulty to my mind is to insure those who are only on for a short period, as I think the old hands would naturally consider it unfair that the migratory hands should have equal benefit with them, if the insurance was supported by the workmen themselves.—LOUIS ERWOLD.

[11970.]—**Fixing Stone.**—I think that cramping with metal cramps fixed with lead is the best; but the cramps are best made of copper, a cheap substitute being galvanised iron. Sulphur may be used instead of lead, and I never remember seeing any stones which had been affected by the sulphur.—LOUIS ERWOLD.

[11971.]—**Flare-Burnt Lime.**—Flare-burnt lime could be used in cases where it was desirable to have a white lime, such as might be used in gauged work, the lime being mixed with silver sand, or even marble dust. —LOUIS ERWOLD.

[11973.]—**Drain-Pipe.**—A 6in. pipe is amply sufficient for main drain to sewer. The fall from *a* to *b* is so small that it would be advisable to fix an automatic flushing tank at head of drainage system. The outlet ventilating shaft is taken from highest point in drain, while the inlet is situated at lowest point. Consult a book on the subject for further particulars.—LOUIS ERWOLD.

CHIPS.

The new Cleveland Borough Lunatic Asylum at Middlesbrough was formally opened on Wednesday in last week. It has been built at a cost, exclusive of site, of £20,000, from plans by, and under the supervision of, Mr. Alfred J. Wood, of 22, Surrey-street, Victoria Embankment, W.C.

St. Peter's Church, Wightman-road, Hornsey, which has been built from designs by Mr. Jas. Brooks and Son, Wellington-street, Strand, by William Parmenter, of Braintree, will be consecrated by the Bishop of London on Friday next, July 1st. It has been built of Monks Park stone, from the quarries of the Bath Stone Firms, Ltd., Bath.

Prince Christian visited Windsor on Tuesday to open a new ward, added to the Windsor and Eton Royal Infirmary in commemoration of the Queen's Diamond Jubilee.

The alcove at the end of the flower-garden, adjoining the conservatory, at Witley Court has just been occupied by a sculptured group in marble, life-size, representing Hagar and Ishmael. It is erected on a specially designed pedestal executed in Portland stone, with elaborately carved enrichments. The pedestal was designed by Mr. W. A. Forsyth, A.R.I.B.A., and executed by Mr. James Forsyth, of London.

On St. Alban's Day the Bishop of St. Alban's laid the foundation-stone of a new church dedicated to the first martyr of Britain at Westcliff-on-Sea. The new district will be carved out of the ancient parish of Prittlewell, Essex. The nave, aisles, and chancel will be finished by Christmas. The architect is Mr. C. Nicholson.

The members of the Hawick Archæological Society had their annual excursion on Tuesday. A company of over sixty, accompanied by the Rev. W. A. P. Johnman, president, left Hawick in brakes, and, driving by way of Denholm and Aucrum Bridge, the company arrived at Monteviot, where, by permission of Lord Lothian, they walked through the grounds, and passing over the private bridge which spans the Teviot, the company proceeded to Jedburgh. The Abbey, Queen Mary's house, &c., were visited. The interior of Fernherst Castle, on the banks of the Jed, was inspected. It is at present being renovated by Lord Lothian. The return was made by way of Swinnie and Bonchester.

The Duke of Devonshire, president of Owens College, visited Manchester on Wednesday, accompanied by the Duchess of Devonshire, for the purpose of opening the new Christie Library at Owens College and laying the foundation-stone of the Whitworth Hall, another addition to the college buildings. The library, a stone building designed, like all the other college buildings, by Mr. A. Waterhouse, is the gift of Mr. R. C. Christie, formerly Chancellor of the diocese of Manchester. The expense of erecting the Whitworth Hall (some £50,000) Mr. Christie is bearing, as one of the residuary legatees of the estate of the late Sir Joseph Whitworth.

On Trinity Sunday, at St. Margaret's Church, Ilkley, a service of dedication was held by the Bishop of Richmond of two windows, executed by Messrs. Powell, of Whitefriars Glass Works, at a cost of £1,150. The general idea is that the west and east windows correspond in conception, representing the Beginning and the End, the Old Creation and the New, the Earthly Paradise and the Heavenly, the First Adam and the Second, the Story of the Genesis contrasted with the Visions of the Apocalypse, the Past with the Future. Thus the figures of the west come mainly from the first book of the Bible, and the illustrative text from the Song of the Three Children; and those of the east almost entirely from the book of the Revelation. In each case the background of the picture is furnished by the Tree of Life (Gen. iii. and Rev. xxii.) A tablet has been supplied of opus sectile.

PARLIAMENTARY NOTES.

METROPOLIS MANAGEMENT ACTS AMENDMENT (BY-LAWS) BILL.—Lord Monkswell moved, on Tuesday, the second reading of this Bill, which has for its object the amendment of the provisions of the Metropolis Management Acts with respect to by-laws. He explained that the Bill proposed to provide that the powers of the London County Council for making by-laws under section 202 of the Metropolis Management Act, 1855, should extend and apply to authorise the Council to make by-laws for the following purpose:—Requiring persons about to construct, reconstruct, or alter drains in connection with buildings, to deposit with the sanitary authority of the district such plans, sections, and particulars as might be necessary for the purpose of ascertaining whether such construction, reconstruction, or alteration was in accordance with the statutory provisions relative thereto, and with any by-laws made under the said section. It was perfectly clear, he said, that such a power was desirable, inasmuch as prevention was better than cure. He understood that the Government agreed with this view, but at present hardly made up its mind as to what authority should sanction these by-laws. Both the Home Office and Local Government Board had declared that they were not the authorities. He had not the slightest objection as to the body that might be selected to sanction the by-laws, but he wished the Bill to pass into law. The Marquess of Salisbury: In this chaotic state of things, which is new to me, I am very doubtful as to who is to move under this clause. Like most other people I have had my little difficulties with drains, and it appears to me, as I suppose it must do to everybody else who has had those difficulties, the object is to get the evil repaired with the shortest possible delay, and that any considerable delay is not only a matter of great inconvenience, but also a serious injury to health. Now, without in the least denying all the qualities which its admirers attribute to the London County Council, I imagine that it, with other departments, experiences the defect of not being able to conduct its work with great rapidity. Unless the departments, both Municipal, political, and Imperial, alter their nature very rapidly, I fear that means an interminable delay. I do not say that that is a reason for resisting the Second Reading of the Bill, but I think some provisions will be necessary for enabling more urgency to be declared, and for requiring the opinion of the County Council and of the Department to be given in a reasonable time. The Earl of Kimberley: It seems to me that a difficulty arises something in the nature of what the noble lord has said. Where there are to be draining operations on a large scale, very often I think it would be an advantage, and there would be no inconvenience from any such delay as might occur in submitting the plans; but, supposing the Bill passes, it does not only apply to large works, but, in point of fact, would require the deposit of plans with regard to the smallest alteration of drains. That could hardly have been intended. If, for the smallest alteration of drains, you are to be obliged to go and correspond with the County Council on the subject, it is pretty obvious that practically such a scheme could not be worked. Some care will be necessary to see that the Bill is not made applicable to such very small matters as might, in point of fact, produce both a nuisance and delay. The Bill was read a second time.

The New Jerusalem Church, Abbey-street, Accrington, was reopened on Saturday, after undergoing renovation and alterations at a cost of over £3,000.

At St. Mary's parish church, Whitby, on Monday, a newly-erected clock in the tower was dedicated, in commemoration of the Diamond Jubilee of the Queen, by the Rev. Marquis of Normandy. The clock has been made and supplied by Messrs. Potts and Sons, of Leeds and Newcastle.

Princess Christian opened, on Friday, the new school which has been erected by the governors of the Stepney and Bow Foundation. The building, which stands on the site of Nos. 31 and 33, Bow-road, forms a complete block, the external portion being faced with red bricks, with Portland stone dressing, while in the interior are 12 classrooms, laboratory, dining-room, and offices, planned to accommodate 300 girls. The contract price for the erection of the building was £13,000.

The members of the Oxford Architectural and Historical Society, with friends introduced by them, numbering together about 120, visited Cambridge on Thursday in last week. On arriving they were received at the Museum of Classical and General Archæology by Professor Ridgeway, the president of the Cambridge Antiquarian Society, who gave a short address upon the general history of Cambridge, and afterwards, with the secretary of the same society, Mr. T. D. Atkinson, accompanied the party to nearly all the colleges, giving short descriptions of the buildings visited, together with brief references to their historical associations.

LEGAL INTELLIGENCE.

THE RESULT OF A STRIKE.—William Ludgrove, of 47, Chaldon-road, Fulham Cross, brought an action against Messrs. Stephens, Bastow, and Co., builders, of Basil-street, Knightsbridge, to recover the sum of £5, which he alleged to be due to him. Mr. Mozley Stark was solicitor for the plaintiff, while Mr. F. J. Robinson defended. According to the opening statement of Mr. Stark, the claim was for one week's wages, and one week in lieu of notice. Plaintiff left because Mr. Stacey, the manager, wanted him to do some bricklayer's work. He objected, being employed as foreman. Answering Mr. Robinson, plaintiff said that at the time there was a dispute between some bricklayers and plasterers. The result of this was that the bricklayers struck work. Mr. Robinson: You belong to the Union, don't you? Yes. And you were in favour of the bricklayers? Naturally. And it was in consequence that a strike occurred? No. Were you not doing picketing? No, sir. Why did you leave? Because I was asked to do bricklayer's work. I was engaged as a foreman. Didn't Mr. Stacey tell you that you would have to go to work or leave? Yes, he told me to do so, but I refused. I took no part whatever in the strike. For the defence, Mr. Robinson contended that the plaintiff could not recover, as he refused to work. His Honour: I find for the defendants. I think that the plaintiff ought to have done the work.

IN RE ATHERTON AND DOLMAN.—The bankrupts were builders, carrying on business at Poplar. They failed in November last, and app'ied on the 15th inst. for their discharge. The assets have realised £1,823 11s. 7d., and it is expected that about £700 further will be received. Proofs amounting to £9,838 have been made against the joint estate. The Official Receiver reported that the assets were not sufficient for the payment of 10s. in the pound on the unsecured liabilities, and that the bankrupts had not kept proper books of account. His Honour suspended the order of discharge for two years.

BURIAL AUTHORITIES AND PURCHASES FOR EXTENSIONS.—In the Court of Appeal on Thursday, the 16th inst., before the Master of the Rolls and Lords Justices Chitty and Collins, judgment was given in an appeal, "Ward v. The Portsmouth Corporation." Mr. Justice Byrne had held that under the Burial Acts, 1852 and 1853, a burial authority had no power to buy land intended to provide at a future date for interment without the previous sanction of the Secretary of State. The decision of the case turned on the meaning of the expression "provide and use" a burial ground, which by force of certain sections of those Acts a burial authority is prohibited from doing without the sanction of a Secretary of State. The short facts of the case were as follows:—The plaintiff, Mr. William Ward, being then the owner of certain land in the parish of Portsea, in August, 1889, agreed with the burial board for the parish of Portsmouth for the purchase of the land for £6,270, of which £100 was to be (and, in fact, was) paid at the time and the balance on completion of the purchase on June 24, 1896. Before the agreement was entered into, the consent of the Portsmouth vestry was obtained, as required by Section 26 of the Burial Act, 1852. In January, 1895, the Corporation of Portsmouth, as the urban sanitary authority, passed a resolution under Section 62 of the Local Government Act, 1894, in pursuance of which the corporation became the satutory successors of the burial board on June 11, 1896. The corporation intimated to the plaintiff, Mr. Ward, that it did not intend to complete the contract. The land had been agreed to be bought for the purpose of enlarging the then existing cemetery for the parish of Portsmouth, but the Home Secretary had refused to give to the Corporation the approval required by the Burial Act, 1853. The plaintiff contended that if this refusal did not justify the corporation in refusing to complete their contract to purchase, and brought the present action for specific performance of the contract, or, alternatively, for damages. Mr. Justice Byrne gave judgment for the defendant Corporation, but their Lordships now reversed his finding, allowed the appeal with costs, and granted damages in lieu of specific performance, directing an inquiry as to their amount.

RESTRICTIVE COVENANTS NOT BINDING ON VENDORS.—HOLFORD V. URBAN DISTRICT COUNCIL OF ACTON.—In the Chancery Division, on Saturday, Mr. Justice Stirling gave judgment in this action, which was brought to restrain the defendants from erecting upon certain plots of land belonging to them a fire-engine station or any buildings other than shops and dwelling-houses of a certain value in alleged breach of a condition of sale under which the plaintiffs had brought from the defendants an adjoining plot of land. The land in question, together with other land, was originally acquired by the defendants under their compulsory powers for the purpose of street improvements in their district. In 1891 they sold a portion of the land so acquired by auction under conditions of sale, which provided that the respective purchasers of certain specified lots should in their respective conveyances enter into covenants with the vendors to erect within two years from the day of sale upon each of the lots bought by them a shop and dwelling-house of not less value than £650. The plaintiff bought one of the plots at the sale and erected thereon a shop and dwelling-house in compliance with the condition. Certain of the plots were not sold, and the defendants had recently determined to erect upon the plots remaining in their possession a fire-engine station which was required for the purposes of their district, and had obtained the sanction of the Local Government Board to the issue of a loan for the purpose of providing the necessary funds. The plaintiff therefore brought this action, contending that the proposed erection of the fire-engine station would be a breach of the condition under which he had bought his property and by which the defendants were themselves bound. Mr. Jenkins, Q.C., and Mr. Tanner appeared for the plaintiff, and contended that he was entitled to restrain the defendants from dealing with the land in any way inconsistent with the condition. Mr. Butcher, Q.C., and Mr. MacSwinney, for the defendants, argued, first, that the covenant was affirmative in form, and there was no negative stipulation not to erect upon the land any buildings other than shops or dwelling-houses, and as no such negative stipulation could be implied the defendants could not be restrained by injunction. Secondly, they contended that even if the covenant could be enforced as between the respective purchasers, it was not binding as against the defendants, inasmuch as it would be beyond their powers to subject the land in their hands to a restrictive condition which would have the effect of preventing them dealing with it for the purposes of the requirements of their district. Mr. Justice Stirling gave judgment on Saturday, and came to the conclusion that, having regard to the authorities, no negative stipulation could be implied in the condition. That being so, the restrictive covenant could not be enforced against the defendants, and the action failed and must be dismissed, and (except as to a special direction on one point) with costs as between solicitor and client pursuant to the powers of the Public Authorities Protection Act, 1893.

CHIPS.

On Saturday a special service was held in Tettenhall Church, Wolverhampton, for the purpose of dedicating three stained-glass windows. The designs of the windows were "The Flight into Egypt," "The Carpenter's Shop at Nazareth," and "The Presentation in the Temple," and the work was executed at the establishment of Mr. C. E. Kempe, London.

The new cottage hospital, Norbiton, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The foundation-stone of the new harbour works at Ostend was laid by the King of the Belgians on Sunday.

The Ashford Rural District Council have instructed Messrs. Bailey Denton, Son, and Lawford, of Westminster, to advise them as to an efficient system of water-supply for Willesborough, a populous suburb of Ashford, where the works of the South-Eastern Railway are situated.

The Marquis of Ripon, K.G., on Friday, visited Brighouse to perform the opening ceremony of a new town's Free Library and Museum. The institution occupies a mansion known as the Rhydings, standing in its own grounds off Halifax-road, the property being purchased for £3,600. The grounds have been laid out as a public park.

The Peruvian Consulate General in London calls the attention of manufacturers to the Permanent Exhibition of Manufactures and Machinery, now open in Lima, in the Machinery Hall of the Exhibition Palace, under the auspices of the Government of Peru, and under the management of the National Society of Industry. No charge is made for space, no duties on exhibits, and many privileges are accorded to exhibitors. Peru offers a splendid field for the extension of British trade. Full particulars may be had of Mr. E. Lembeke, Consul-General, 237, Winchester House, Old Broad-street, E.C.

The tender of Mr. Thomas Smith, Chilvers Coton, has been accepted for the erection of a new Baptist Church, at the corner of Willington-street and Manor Court-road, Nuneaton. Five tenders were submitted, and the lowest was that of Mr. Smith, £1,060. Building operations will commence shortly. The architect is Mr. John Wills, F.S.Sc., Victoria Chambers, Derby. The style adopted is Early Gothic. The church will provide accommodation for 671 adults, and the schools will accommodate 466 young persons. The assembly-room will seat 350 to 400 people. The walls will be of brick, with white stone dressings, and the seats and rostrum will be of pitch-pine. The heating will be by hot water, low-pressure system.

Our Office Table.

WE regret to hear that Mr. Arthur Cates, for more than half a century past the surveyor to the Commissioners of Woods and Forests (or, in other words, to the Crown), and who is also president of the Appellate Committee under the London Building Act, is about to retire owing to failing health. No one has had a more extensive connection with the improvement of London than Mr. Cates. The Commissioners own a vast amount of property in the Metropolis, and during Mr. Cates's period of office a great portion of it has been rebuilt. Battersea Park, Whitehall-court, and many other extensive schemes have been carried out under Mr. Cates's direction. Mr. Cates's offices occupy part of the site to be utilised for the new War Office buildings which are shortly to be commenced. These will cover the whole of the island between Whitehall-place, Whitehall-court, and Whitehall. Mr. Cates is to be succeeded by his nephew, Mr. Green, a well-known architect. Mr. Cates has done an immense amount of unrequited service to the architectural profession, notably in connection with the examination movement, into which he has thrown his heart and soul since 1855. He joined the Board of Examiners in 1877, and acted as its chairman from 1882—when the examination became compulsory on those seeking to become Associates of the Institute—until January of last year, when he retired.

MR. F. C. PENROSE, F.R.S., F.R.I.B.A., who last week received the honorary degree of LL.D. from Cambridge University, was further honoured on Wednesday by the University of Oxford, which conferred upon him the honorary degree of Doctor of Civil Laws. In introducing Mr. Penrose, reference was made by Dr. Goudy, Regius Professor of Civil Law, to the renown which he had acquired at Cambridge as an oarsman. On leaving the University, he began the investigation, as an architect, of ancient Classical monuments, and introduced a new method for determining the age of ancient temples from their orientation. To no one more than to him was the present success and popularity of archæological studies to be attributed.

A CONFERENCE of Peers, members of the House of Commons, and representatives of associations interested, was held in Committee-room 13 of the House of Commons at 5 p.m. yesterday (Thursday) to consider the desirability of making some permanent arrangement for concerted action between members of Parliament in both houses on questions relating to (*a*) the protection of rural scenes and landscape and town prospects from such disfigurement or impairment as is not justified by considerations of public utility; (*b*) the provision and maintenance of commons, open spaces, public parks, and gardens; (*c*) the preservation of buildings and places which are of peculiar interest by age, beauty, or association, whether historical or literary; (*d*) the conservation of wild animals and plants; and generally for asserting the importance on broad grounds of public policy of maintaining beauty, simplicity, dignity, and interest in the aspect of out-of-doors Britain. The Right Hon. James Bryce, M.P., and Mr. Boulnois, M.P., were among the principal speakers. With a view to assisting from outside, and of co-ordinating the various agencies now in existence for the promotion of the ends indicated, it was decided that the Commons Preservation Society, the Metropolitan Public Gardens Association, the Kyrle Society, the National Trust, the Selbourne Society, the Society for the Protection of Ancient Buildings, the Society of Antiquaries, and the Society for Checking the Abuses of Public Advertising, be asked to appoint each two members, who shall form a Joint Standing Committee.

THE action of the scientific men who protested against the Government proposal in connection with the building scheme at South Kensington to find room for the science collections alongside the art sections on the east of the Exhibition-road has led to a reconsideration of the question on the part of H.M. Office of Works, and it is now probable that some modification of the scheme will be made by the authorities. A suggestion finds favour that, while the whole new front of the South Kensington Museum should be devoted to the purposes of art, part of the east wing to be erected might serve as an extension of the Royal College of Science, which cannot well be moved from its present site to a position across the

Exhibition-road, where the rest of the scientific departments are housed.

The urban district council of Walthamstow have accepted an offer from the Lloyd family to present to them the ornamental grounds surrounding the house known as the Winns, in Forest-road, consisting of about 9½ acres, for use as a recreation ground, provided the council will purchase from the executors of the late Mr. Lloyd the adjoining pieces of land, containing 9¼ acres, to be used as public playing-fields in connection with the recreation ground, at a valuation to be made by an independent surveyor. The president of the Surveyors' Institution, who was invited to appoint a valuer for the playing-fields, has nominated Mr. Alfred Savill, of New Broad-street. The Winns is a manor house standing in its own grounds, and was built in 1760. It was the birthplace of the late William Morris, art decorator, socialist, and poet, and for many years it was occupied by the late Mr. Edward Lloyd, the last tenant, who followed Mrs. Morris, but has been empty for thirteen years past.

An important addition to the accommodation provided for scholars and students at the British Museum has lately been made. This is a new room specially set apart for persons studying or engaged in researches in Oriental literature as distinct from the general reading-room. The room is an annexe of the department of Oriental printed books and manuscripts, and accommodates 24 students. The regulations for admission are those of the general reading-room. The department has lately issued the largest and fullest catalogue of Japanese books ever printed in Europe, consisting of upwards of 5,000 separate Japanese works, representing the museum collection, which has been brought together during many years and under various circumstances.

The second annual exhibition connected with the building and decorative trades was opened at St. James's Hall, Manchester, on Monday. An effort has been made on this occasion to bring together the most recent improvements, chiefly in sanitary appliances, in order to show the constant progress which is being made. There are more than one hundred stands, some of these being devoted to terracotta, majolica, and art metal ware, mosaic flooring, woodwork, stained-glass, &c. There are the usual entertainments with which visitors to these exhibitions have become familiar, during the week, the chief being a series of performances by the string band of the Royal Artillery from Woolwich, which was present yesterday. At the opening, on Monday, Mr. Edward Salomons, architect, presiding, Mr. R. J. Bennett, president of the Manchester Society of Architects, said he understood that last year the exhibition was visited by 60,000 people, and he hoped that this year the number would be doubled. Speaking of the educational benefits of such exhibitions, he referred to sanitary appliances, in which, he said, they had made greater progress than in any other department of the building trade. Corporations and local authorities had become extremely alive to their responsibilities, insisting upon more wholesome conditions of life, and doing their best not only to provide a remedy for, but a prevention of, evils which had existed in the past. Manchester was one of the centres which had been placed highest in the mortality table, but in recent years the figures had been reduced eight per thousand, and although this was satisfactory, they were still five per thousand ahead of London, with its enormous aggregation of human life. No doubt by taking full advantage of the latest improvements in sanitary science they could get on a level, if not advance upon, London.

Mr. Frank Dethridge, vestry clerk of Paddington, on Monday received from the Chancellor of the London Consistory Court a faculty enabling the local vestry to erect a town-hall on the ground covered by, and at the rear of, the present vestry-hall, Harrow-road—a building found wholly inadequate to present requirements.

The Clarendon Temperance Hotel in Clayton-street, Newcastle-on-Tyne, was opened on Friday. The building occupies the site upon which stood the John Knox Presbyterian Church—now migrated to Elswick-road. Its main front is into Clayton-street, its two sides face Berwick-street on the one hand, and Pink-lane on the other. The hotel occupies the greater part of the edifice, and a portion is devoted to business premises, with shops and offices. The building was designed by Messrs. Oliver and Leeson, and built by Messrs. J. and W. Lowery, all of Newcastle.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Special Business Meeting to consider the Revised Schedule of Professional Charges. 8 p.m.

THURSDAY.—Dundee Institute of Architecture. Annual Meeting. 2.30 p.m.

THE ARCHITECTURAL ASSOCIATION.

JULY 2nd, VISIT to Hever Castle, Kent. P.O. for 2s. 9d. to be sent to Mr. A. S. Flower, 7, Gordon-place, W.C., on or before JUNE 29th. Meet below clock at Victoria Station at 1.15 for the 1.30 train. Return train leaves Hever at 6.30.

E. HOWLEY SIM
G. E. CARVILL } Hon. Secs.

CHIPS.

The very interesting house in Westbourne-grove, for many years occupied by Prince Lucien Bonaparte, is now being converted into residential flats, from the designs of Mr. W. I. Chambers, architect, Savoy House, W.C.

The school board for St. Mary Extra, near Southampton, have adopted plans by Messrs. Mitchell, Son, and Gutteridge, of the latter town, for new schools in Ludlow-road.

The Salford Board of Guardians have resolved, subject to the consent of the Local Government Board, to purchase Twiss Green House and land situate at Kenyon Junction, containing about 40 acres, for £4,500, as a site for cottage homes for poor children.

The work of building additional classrooms and cloak-rooms at St. Anne's schools, Edge-lane, Royton, Lancs, has commenced. The contract has been let to Mr. Whittaker, of Oldham, at about £500.

The plans of Mr. C. A. Sharp, of 59, Fenchurch-street, have been accepted by the managers of the Kensington and Chelsea School District for the erection of a drill-hall and gymnasium.

Mr. W. G. Willcocks, Local Government Board Inspector, held an inquiry at Rugby on Friday, with reference to the application of the urban district council to borrow £2,650 for the purchase of land for sewage disposal purposes, £1,920 for a new fire-engine station, £770 for an improved outfall sewer, and £2,500 towards the cost of erecting new public offices on the site of the Shoulder of Mutton Inn, in the High-street, recently bequeathed to the council.

The town clerk of Bradford has received from Lord Masham a cheque for the £40,000 which his lordship promised for the erection of a Cartwright Memorial and Art Gallery in Manningham Park.

The members of the Newcastle Society of Antiquaries will hold their first country meeting of the season on Monday, July 4, at Raby and Staindrop. Raby Castle, the ancient seat of the Nevills, will, by permission of Lord Barnard, be visited, and will be described by the Vicar of Witton-le-Wear, the Rev. J. F. Hodgson, who will also describe Staindrop Church, which will subsequently be inspected.

The foundation-stones of a new Conservative club now in course of erection at the corner of New Bridge-street, Nuneaton, were laid on Saturday by Mr. F. A. Newdigate, M.P. We illustrated the building in our issue of the 3rd inst. The contractor is Mr. T. Smith, of Chilvers Coton, and the architect is Mr. Charles William Smith, M.S.A., Grantham, whose plans were selected in competition.

Mr. F. T. Beck, architect, of Wolverhampton, has been appointed surveyor for the archdeaconry of Stafford, in succession to the late Mr. J. R. Veall, of the same town.

Last week the opening took place of the new waterworks for Machynlleth, in the Esgaireira Valley, which is situated about 4¾ miles from Machynlleth, and impounds the water from two streams flowing down the Cwmreseger Valleys. The area of the reservoir is about 2½ acres, and it contains, when full, about 7,000,000 gallons. Its greatest depth is 21ft., and it will afford 86 days' supply to the town of Machynlleth at a time when the brooks are dry. The works have cost the urban district council over £6,000. Mr. Kirby was the engineer, Mr. Phœnix the contractor, and Mr. C. Smith the clerk of works.

The monument to Pasteur to be erected before the Pantheon, Paris, will show him putting Death to flight, and a mother with her child thanking him, while Fame crowns him with laurel. The international subscription for the monument is now nearly £13,000.

The widening of the junction of Arwenack and Church-street, Falmouth, by the setting back of a portion of the church boundary wall, is now being effected by Messrs. Corder and Barnicoat, for the churchwardens and the corporation.

The memorial-stone of the new church of St. Luke, West Hampstead, was laid on Saturday. The church is being built from plans by Mr. Basil Champneys, B.A., at a cost of about £11,500.

Trade News.

WAGES MOVEMENTS.

ASHTON-UNDER-LYME.—The dispute in the Lancashire and Cheshire building trade has extended to the Ashton-under-Lyme district, and on Saturday the federated employers locked out 50 per cent. of the stonemasons. The men ask for an advance of 1d. per hour, and certain changes in rules governing their employment. On Saturday the Bolton operative plasterers struck work for an advance in wages of 1d. per hour, and a reduction of two and a half hours per week. The masters offer to grant the increase in pay, but refuse the reduction of hours.

BERWICK-ON-TWEED.—The masters have granted an advance of 1d. per hour to the plasterers, who last week struck for a rise of wages from 7d. to 8d. per hour.

BLACKPOOL.—Another dispute commenced between the master builders and bricksetters on Thursday in last week, when the Bricklayers' Union called out all the men in the town. The union first stopped all members working who were not in receipt of the extra penny advance which was demanded some weeks ago. At that time the rate of a bricksetter's wages was 9d. per hour, and they then followed in the footsteps of the plasterers, who had succeeded in getting an increase from 9d. to 10d. The masters, in a few instances, had no alternative but to grant the request, owing to important contract work in hand, and the fact that proprietors were pressing for a completion of the work; but others refused the advance.

BOLTON.—The six months' notice given by the Bolton operative plasterers expired on Saturday, and as the employers and the operatives had been unable to come to an agreement on the points in dispute, the men, to the number of 75, left work on Saturday. The notice asked for an increase of wages from 9d. to 10d. per hour, making an increase of 2s. 3d. on the week, and a reduction of working hours in summer from 52 to 49½ hours a week, which would mean taking off half an hour every morning except Monday, which is a shorter working day. The masters contended that the notice was illegal, as it ought to expire, according to the working rule, either in July or August. They offered a 1d. per hour advance on condition that the notice was extended to July 18, with a slight alteration in the hours. The men rejected these proposals, the decision being communicated to the masters on Friday evening. The labourers have accepted ½d. per hour advance, and have had working rules signed between themselves and the employers, and will remain at work. With their aid, the masters believe they will be in a position, with their apprentices, to cope with most of their work.

LIVERPOOL.—Unless a settlement is soon arrived at between the operative masons and their employers in Manchester, Aston, Bury, Chorley, Preston, and Lancaster, the dispute will have a serious effect upon Liverpool, where the masters intend to take a stand beside the other employers. In Liverpool the federated employers have posted the following circular:—"This is to give notice that unless the dispute now in progress in the towns (those already mentioned) affiliated to the federation is settled on or before Saturday, July 9, the masons employed in the work will be locked-out. By order of the federation." The dispute has arisen because, it is alleged, the masters are bringing stone worked at quarries in districts where the men are underpaid.

SUNDERLAND.—The bricklayers' labourers at Sunderland have rejected the offer of the Master Builder's Association of a farthing per hour advance in wages.

The municipality of Calloa has decided to construct water and drainage works at an estimated cost of £60,000.

A new chapel for the Free Methodists has been opened in Parks Hill, Bury, Lancs. It provides nearly 500 sittings, and has cost over £2,500.

The Lord Mayor visited Dartford on Saturday, and laid the foundation-stone of a new chapel, which forms part of extensive additions to the City of London Lunatic Asylum at Stone. The chapel will be Early Decorated in style, and will accommodate 300 persons.

The London United Tramways Bill, which provides for the erection of electric tramways in Acton, Ealing, Brentford, and Isleworth, of about six miles in length, to be worked on the "trolley" system of overhead wires, was considered on Friday, Monday, and Tuesday by a Select Committee of the House of Commons. They decided that the preamble of the Bill with regard to tramways Nos. 6 and 7, the Boston-road, and the Kew Bridge to Hounslow sections—was proved, but were of opinion that the preamble was not proved with regard to tramway No. 8—Ealing.

LIST OF COMPETITIONS OPEN.
